Clarifying energy storage terms

From what I can determine through word search of the 2022 energy code, any reference to energy storage is deemed to be electric battery storage. With the strong possibility that thermal storage (phase change material other than water/ice and as opposed to hot water storage) will be introduced in to the residential and light commercial markets before 2030, it would make sense to distinguish the two. The 2025 energy code should make reference to electrical energy storage and thermal energy storage, if included.

Thank you
