

DOCKETED

Docket Number:	23-MISC-01
Project Title:	Offshore Wind Waterfront Facilities Improvement Program
TN #:	253207
Document Title:	Transcript of 11-3-23 for Workshop
Description:	N/A
Filer:	Eli Harland
Organization:	California Energy Commission
Submitter Role:	Commission Staff
Submission Date:	11/17/2023 1:53:26 PM
Docketed Date:	11/17/2023

CALIFORNIA ENERGY COMMISSION

In the matter of:

Offshore Wind Waterfront)
Facilities Improvement Program) Docket No. 23-MISC-01
_____)

STAFF WORKSHOP ON OFFSHORE WIND WATERFRONT

FACILITY IMPROVEMENT PROGRAM

HYBRID IN-PERSON AND ONLINE BY PHONE AND VIA ZOOM

FRIDAY, NOVEMBER 3, 2023

1:00 P.M.

Reported by:

Chris Caplan

APPEARANCESCOMMISSIONERS

Patricia Monahan, Lead Commissioner, CEC

David Hochschild, Chair, CEC

CEC STAFF

Eli Harland, Siting, Transmission, and Environmental
Protection Division

Hilarie Anderson, Siting, Transmission, and Environmental
Protection Division

STATE LANDS COMMISSION

Jennifer Lucchesi, Executive Director, State Lands
Commission

PORTS AND HARBORS PANELISTS

Matthew Trowbridge, Moffatt and Nichol

Rob Holmlund, Humboldt Bay Harbor, Recreation &
Conservation District

Suzanne Plezia, Port of Long Beach

Mike DiBernardo, Port of Los Angeles

Simon Betsalel, Port of San Francisco

David Yow, Port of San Diego

Miguel Rodriguez, Port of Hueneme

Mike Rademaker, Crescent City Harbor District

Thomas Zickgraf, Comptroller, Crescent City Harbor District

APPEARANCESPORTS AND HARBORS PANELISTS

Jason Garben, Port of Oakland

PRIVATE SECTOR PANELISTS

Brian Sabina, Clean Energy Terminals

Sean Boyd, Ernst & Young Infrastructure Advisors

Sloane Perras, Foss Offshore Wind

Molly Croll, American Clean Power

PUBLIC COMMENT

Nancy Kirshner-Rodriguez, Oceantic Network

Dan Jacobson, Environment California

Greg Hurner, American Waterways Operators

John Reed, ChannelWind

Alison Hahm, Natural Resources Defense Council

Adam Stern, Offshore Wind California

Sheri Hafer, Central Coast Women for Fisheries

Steve Ray

Tom Hafer, President, Morro Bay Commercial Fishermen's
Organization

Thalia Krüger, Principle Power

INDEX

<u>ITEM</u>	<u>PAGE</u>
1. Welcome and Introduction	6
2. Opening Remarks	8
3. AB 209 Offshore Wind Port and Harbor Infrastructure Improvements	13
4. Perspectives from Ports and Harbors	33
• Matthew Trowbridge, Moffatt and Nichol	
• Rob Holmlund, Director of Development, Humboldt Bay Harbor, Recreation and Conservation District	
• Suzanne Plezia, Chief Harbor Engineer, Port of Long Beach	
• Mike DiBernardo, Deputy Executive Director of Marketing and Customer Relations, Port of Los Angeles	
• Simon Betsalel, Capital Projects Manager, Port of San Francisco	
• David Yow, Government & Civic Relations, Port of San Diego	
• Drew Rodriguez, Community Outreach Representative, Port of Hueneme	
• Mike Rademaker, Assistant Harbormaster, Crescent City Harbor District	
• Jason Garben, Manager, Project Management Services, Port of Oakland

INDEXITEM

6.	Perspectives from Private Sector Participants	97
	• Brian Sabina, CEO, Clean Energy Terminals	
	• Sean Boyd, Managing Director, Ernst & Young Infrastructure Advisors	
	• Sloane Perras, Vice President, Foss Offshore Wind	
	• Molly Croll, Pacific Offshore Wind Director, American Clean Power	
7.	Public Comment	139
8.	Closing Remark	160
	Adjournment	164

P R O C E E D I N G S

FRIDAY, NOVEMBER 3, 2023

1:03 p.m.

MR. HARLAND: So good afternoon, everyone. My name is Eli Harland. I work for the California Energy Commission, and I work in our Siting, Transmission, and Environmental Protection Division. Today's workshop is focused on the development of Offshore Wind Waterfront Facilities Funding Program that the Energy Commission is beginning to stand up.

Next slide, please.

Okay, before we jump in, I just wanted to provide a few housekeeping items.

First, this hybrid is -- or this meeting is a hybrid meeting with attendees in-person, as well as on Zoom.

We are in the California Natural Resources Agency auditorium. And anybody who needs to use the facilities, hopefully you found those out in the front of the auditorium on the right side of the doors.

I wanted everybody to know that this workshop is being recorded. We are also producing a transcript of the workshop today.

For those on Zoom, closed captioning has been enabled. And if you want to use this service, you can click on the live transcript icon. And if you want to stop

1 that, you can also just click on hide subtitle icon.

2 If you're in the room, please ensure that the
3 doors remain accessible for folks who want to come in and
4 out today. Again, restrooms and water fountains are off to
5 the right in the hallways.

6 If an evacuation is necessary, please leave the
7 building immediately to the nearest exit or as being
8 advised. And the evacuation site for this CNRA building is
9 the Roosevelt Park, which is located a couple blocks away
10 on P and 9th Street.

11 And then throughout the day, we'll go over this,
12 but there's going to be an opportunity at the end of this
13 workshop for public comment. We're also asking for written
14 comments to come through by November -- or by December 1st,
15 2023. So we tried to provide a little bit of ample time to
16 react to today's workshop to provide those comments. I'll
17 be providing instructions again throughout the workshop on
18 how to submit those written comments.

19 And just wanted to bring to everyone's attention
20 at the workshop today, we do have a website that we've
21 developed specifically for this program. It was in the
22 workshop notice. It's on the slides today, and you'll be
23 able to see that a couple different times.

24 Next slide, please.

25 So our schedule today, if you didn't see it

1 posted yesterday online, we're starting with the welcome
2 and introductions. We're going to hear opening remarks
3 from state agency leadership. Following that, I'm going to
4 provide a presentation on the work we've been doing to
5 jumpstart the AB 209 Offshore Wind Port and Harbor
6 Infrastructure Improvements Program. And then we're going
7 to have a panel where we're going to hear perspectives from
8 ports and harbors. All of those participants are sitting
9 up here with me now.

10 We'll take a short break and transition to our
11 second panel today. That panel is going to hear
12 perspectives from private sector participants. And when
13 that panel concludes, we'll go into the opportunity for
14 public comments, have some closing remarks, and then we'll
15 be done for the day and hopefully out of here early enough
16 on a Friday afternoon for everybody.

17 So next slide.

18 All right, so I wanted to invite first Chair
19 Hochschild to make opening comments, followed by
20 Commissioner Monahan. And then after that, we'll hear from
21 Jennifer Lucchesi.

22 Chair, over to you.

23 CHAIR HOCHSCHILD: Thank you so much, Eli, for
24 all your work and diligence on this important issue. And
25 welcome to everybody. I'm not sure who the gentleman is on

1 the right-hand side of the dais who is particularly well-
2 dressed, but I like the outfit, and thank you to everybody
3 for joining in person and online today. I'm David
4 Hochschild, Chair of the Energy Commission.

5 I also wanted to just extend a special thanks to
6 Jen Lucchesi from the Lands Commission, which is one of our
7 sister agencies that plays just an absolutely instrumental
8 role in this effort. And as we press forward to build a
9 future that's 100 percent powered by clean energy with 25
10 gigs of offshore wind, you know, it will require a lot of
11 new investment, and I think we're at a moment where
12 industrial policy and climate policy are now really
13 inextricably intertwined. And we have to, you know, begin
14 with some really bold planning.

15 So this initial chunk of funding, this \$45
16 million, is a great down payment on that, but by no means
17 is it the totality of what's needed. But it is a really,
18 really important moment, and we want to have a really
19 robust dialogue to help us deploy these funds as wisely as
20 we possibly can.

21 I also want to just offer my thanks to my
22 colleague, Patty Monahan, who's been a wonderful partner on
23 clean transportation and on ports, and her expertise is
24 just tremendous in this area.

25 So with that, let me pass it over to you, Patty.

1 COMMISSIONER MONAHAN: Thank you, Chair. Well,
2 it's a pleasure to be here. As Chair Hochschild said --
3 well, as he didn't say, I have a frog in my throat, but as
4 he said, I'm the leader on transportation at the Energy
5 Commission, and I've been convening the Ports
6 Collaborative, which is a group of organizations in ports,
7 to talk about the opportunities and challenges as it
8 relates to port decarbonization.

9 And I'm really excited to work with you, Chair
10 Hochschild, in helping, you know, matters related to ports
11 and offshore wind, which is a really critical intersection.
12 And we want to make sure, as the Chair said, this is
13 industrial policy, we want to make sure we create as many
14 good jobs here in California as we can. We want our goals
15 (indiscernible) and this is a really important down payment
16 on that engagement.

17 So California, as I think we all know, we're
18 leading in terms of a 100 percent clean energy future for
19 all, and offshore wind is a critical piece of that
20 equation. So I don't know if you have seen the news that
21 we are ahead of our new goals on vehicles, but we've
22 reached 1.5 million zero-emission vehicles sold. We've
23 reached our 10,000 EC fast charging goal two years ahead of
24 schedule. And now the Governor's Office just announced
25 that we hit 26.7 percent of all new cars sold in California

1 in Q3 as being zero-emission. So we're leading on all
2 fronts, and offshore wind is a key part of this.

3 Like the Chair, I just want to thank all the
4 staff, the division staff, including Eli, the director of
5 the Siting, Transmission, and Environmental Protection
6 Division -- (clears throat) if I can get my voice to go --
7 Elizabeth Hubert, for putting this workshop together. And
8 just thanks to all the panelists, really looking forward to
9 the day and the discussion to learning and to moving
10 forward together.

11 So with that, is Jennifer here? I'm sorry, I
12 guess --

13 MS. LUCCHESI: Yes, I'm here.

14 COMMISSIONER MONAHAN: Oh, great, Director. Do
15 you want to make a few opening remarks on behalf of the
16 State Lands Commission?

17 MS. LUCCHESI: Yes, I'm happy to. Thank you so
18 much. And thank you, thanks to you and to Chair Hochschild
19 for your leadership in all things offshore wind and
20 transportation. And also want to extend my gratitude to
21 Eli and the entire Energy Commission staff team who are
22 working day and night to help uplift and support the new
23 offshore wind industry that we're all working towards.

24 The State Lands Commission manages state lands
25 and resources on behalf of the state. And as part of that

1 job, we also provide oversight over our ports, harbor
2 districts, and working waterfronts who manage certain lands
3 and resources on behalf of the state. And as part of that
4 oversight, we really like to look at that as a partnership
5 with our ports and our harbor districts and our working
6 waterfronts to really fulfill and uplift the job that they
7 have and ensure that they have the resources that they need
8 to manage these lands and resources in an equitable and
9 sustainable manner on behalf of all Californians.

10 And so it's been a real pleasure working with all
11 the harbor districts and ports on this panel and many
12 others that are probably listening in. And I'm really
13 looking forward to hearing the various perspectives and
14 ideas and thoughts on how we can deploy this initial
15 funding.

16 We are looking at a funding requirement for port
17 infrastructure to support offshore wind of \$11 billion to
18 \$12 billion. So I really appreciate Chair Hochschild
19 talking about this as an initial down payment.

20 And so just really looking forward to the
21 discussion. And thank you for having me. I appreciate it.

22 Eli?

23 MR. HARLAND: Great. Thank you so much. And
24 thanks to both the of Commissioners for attending, and
25 Jennifer, for you being here.

1 Next slide, please.

2 Okay, so a core purpose of the public workshop
3 today is to initiate a public process for implementing a
4 new program established at the Energy Commission with the
5 passage of Assembly Bill 209 that was part of the 2022-23
6 state budget. AB 209 is a major energy and climate change
7 bill and it touches on several priority topics for a number
8 of state agencies. Ports planning and development is one
9 of many of those priorities.

10 Next slide, please.

11 So a section of AB 209 that was -- when it was
12 passed, added what are called clean energy programs to the
13 CEC statutes. And so the bottom of the slide there has a
14 list of those clean energy programs that were added. One
15 of those programs that were added is the program we're
16 going to talk about today. But I just wanted to highlight
17 that, you know, of those five, they really range from
18 things like decarbonizing the industrial sector,
19 decarbonizing food production, scaling up the use of
20 hydrogen, electrifying end uses in buildings. So this
21 program is embedded in a much larger policy push and
22 direction on a lot of different fronts on energy and
23 climate.

24 There are general provisions that were passed in
25 AB 209 that apply to these five clean energy programs, and

1 so I wanted to highlight those first. Within those general
2 programs -- within the general provisions, there are
3 definitions that were added, some that apply directly into
4 the program we're talking about today, but most of them are
5 actually applicable to the other four programs. There are
6 reporting requirements that are put on to the Energy
7 Commission for the AB 209 programs, and we'll have our
8 first reporting requirement due to the legislature in
9 March, and then annually thereafter.

10 There are also statutes that touch on the
11 applicability when talking about the use of any funding
12 that is used for these programs, and some that are about
13 specific allowances on the funding programs themselves.

14 One that I wanted to highlight is Public Resource
15 Code section 25661. This is a specific allowance of funds
16 that gives us authority to use up to 15 percent of funding
17 that was appropriated to contract for or use an interagency
18 agreement to obtain technical scientific outreach and
19 administrative services.

20 I will mention that we have looked at this
21 provision some, but our focus has been on how to implement
22 the program with more of a direct assistance approach. But
23 I wanted to highlight that because today we're going to be
24 walking through most of the statutory framework. And
25 there's sort of a box that gets developed with that

1 statutory framework that we need to operate within.

2 Next slide, please.

3 So specifically, the funding that was
4 appropriated for this program came in the 2022 state
5 budget. The clean energy programs that I just touched on
6 in AB 209, those are really the statutory framework. So
7 there's two moving pieces here. The first one is AB 209
8 and that statutory framework.

9 But the second one that is important for us to
10 talk about today and to put out there is that the state
11 budget itself appropriated funds to be used for those
12 statutes. And in that budget act, \$45 million was
13 appropriated to the CEC for this program. About five
14 percent of that was allocated for using for administrative
15 costs at the CEC with the remaining balance for the program
16 itself. So that leaves us with about \$42.75 million to use
17 as direct funding for the program. And \$2.25 million is
18 used for support, to support administrative cost of the
19 program.

20 The state budget also did two other important
21 things that we should put on the table that set an
22 encumbrance deadline for this funding at the CEC before
23 June 30, 2025. And encumbrance means that we have to have
24 the funds committed to a certain agreement or spending
25 pattern. And then following the encumbrance, the

1 legislature also set a liquidation date for these funds and
2 that liquidation date is June 30, 2029.

3 So as we look at implementing the program, that's
4 sort of the outer bounds on our schedule when it comes to
5 committing the funds, but then also having those funds
6 liquidated. And I'll note that all of those, the words
7 that are used there are all before those dates. So it
8 doesn't mean it's the schedule, it just means that that's
9 our sort of outer bound of our schedule.

10 And so just wanted to make sure and touch on
11 those broader statutory frameworks that were established so
12 that we can begin to kind of flesh out how we go about
13 implementing those as we read the language the way that
14 it's written in the law.

15 Next slide, please.

16 So within the clean energy programs and within
17 the specific statutes, there is direction that's
18 established in state law. The first one is that there is
19 language directing us -- or I would say language basically
20 establishing and directing us to create a program. I'll
21 paraphrase exactly what that language is because I think
22 it's important to start with the way that the law spells
23 this out,

24 "The Commission shall establish and administer a
25 program to support offshore wind infrastructure

1 improvements in order to advance the capabilities of
2 California ports, harbors and other waterfront
3 facilities to support the buildout of offshore wind
4 facilities and maximize the economic and environmental
5 benefits of an offshore wind industry in California."

6 These statutes don't go further to define how we
7 are supposed to establish and administer a program and so
8 that's part of the purpose of today. And the approach we
9 are proposing to use at this point to get going is to use
10 one, two or even more grant funding solicitations. I'll
11 discuss more about what a grant funding solicitation is in
12 a few slides from now.

13 Also the statute includes permissive language in
14 which the CEC may adopt guidelines for the program. And at
15 this point, as I mentioned, we're proposing to use the
16 statutory language that's in place to create a grant
17 funding solicitation. We're also having this workshop
18 today and the public comment opportunity to help gather
19 information that we can use to be able to help us develop
20 this grant funding opportunity.

21 And then also importantly, the statutes do
22 provide direction on eligibility as we establish this grant
23 program. And to paraphrase what the statute says again, is
24 eligible applicants shall include California port
25 authorities, port operators, port commissions and their

1 respective authorized agents or other California waterfront
2 facilities, and other entities that demonstrate a
3 commitment to California offshore wind energy investments
4 and are partnered with a California waterfront facility.

5 So we have direction on eligibility. I think we
6 also have an opportunity on understanding what some of that
7 terminology means and hearing, I think, from the
8 participants we have in the workshop today as well as
9 public comment on those.

10 Next slide, please.

11 So in addition to defining the program itself, as
12 well as specifying eligible applicants, the statutory
13 language also describes four allowable uses of the funds.
14 Within those four allowable uses, the language includes
15 three specific categories, which we'll talk about in a
16 second, as well as one kind of, I would say, general
17 allowable use. I'm going to read the statutory language
18 really close to verbatim so that we can all have a common
19 understanding of what, again, what the law says.

20 So as I mentioned, it's established three
21 categories. The first category is called Category 1
22 activities in the statutes, and Category 1 activities are
23 described as those that support the development of
24 individual or regional retrofit concepts and investment
25 plans. Category 1 activities may include planning,

1 feasibility analysis, business case development,
2 environmental analysis, engineering and design work, and
3 other offshore wind energy related planning and development
4 activities.

5 Okay, next slide, Hilarie.

6 Category 2 activities, so Category 2 activities
7 support final design, engineering, environmental studies
8 and review, and construction of retrofits. Category 2
9 activities may support a range of retrofit activities to
10 support deployment of offshore wind energy, including land
11 expansion for component assembly, staging and
12 transportation, facility updates, such as adding lay down
13 and storage areas, increasing heavy lift crane weight and
14 height capabilities, and other improvements to support the
15 long term operation and maintenance of offshore wind
16 generation facilities and other offshore wind energy
17 related design and development activities.

18 That's a long sentence in the statute for sure,
19 but I organized it in bullets up there. But if you do
20 check the statute out, you will see that it's one long
21 list.

22 Next slide, please.

23 Category 3. Category 3 is -- essentially, it
24 says that we can provide cost share funding to an eligible
25 applicant that receives a federal award for things that are

1 consistent with the two categories we just described.
2 Allocated in this category, these are described as Category
3 3 funds themselves.

4 So those are the three categories that were
5 established along in the clean energy programs in AB 209.

6 And then there's a fourth allowable use, it
7 doesn't have a category assigned to it, but we can use
8 these funds for preliminary engineering and environmental
9 review work, including taking actions and preparing
10 material to comply with the California Environmental
11 Quality Act or other federal environmental laws.

12 So that is the statutory framework that we are
13 looking to implement and those are sort of the background
14 on what the statutes are. So I wanted to share a bit more
15 about what we've been looking at so far.

16 So next slide, please.

17 Okay, so as I mentioned, we are looking at and
18 starting to develop a grant funding opportunity to
19 implement this program. The CEC uses several methods for
20 different program solicitations. Some of you may have been
21 recipients of those before or applied to those. Sometimes
22 we'll use things like a request for proposals, invitation
23 for bids, we've used block grants, rebates, and grants.
24 And so what we're talking about today is implementing this
25 program via a grant program.

1 And kind of the distinguishing characteristics,
2 and this is by no means all of them, it just seemed like
3 some of the important ones to share today so that we could
4 get -- kind of take the statutory framework that we have
5 plus this grant mechanism to understand how we go about
6 developing something that turns into a funding
7 solicitation.

8 And some of those unique things about grants, the
9 CEC would issue a funding solicitation, and then it's on
10 the responsibility of the applicants to respond to that
11 solicitation. And you respond to that with your own
12 project that would include an applicant's scope of work,
13 you would include a budget for that scope of work, a
14 project narrative, and a whole host of other things that
15 tend to be a bit more template driven.

16 I've put a link on this website, if you haven't
17 already seen this before, but the CEC has many funding
18 opportunities. And on this link, you can go there and you
19 can see what a grant funding opportunity looks like, or a
20 GFO, to begin to kind of prepare or assess how we'll go
21 about implementing this program through a grant.

22 So I just wanted to also highlight that within a
23 grant funding solicitation, you'll also see things that
24 sort of set up the rules for the funding solicitation. And
25 you tend to see things like who's eligible to apply, a

1 solicitation schedule, we'll set minimum and maximum
2 funding amounts, as well as, again, those application
3 requirements, like a project narrative, a scope of work,
4 budget. And then the grant solicitation also includes the
5 criteria that will be used to evaluate applications.

6 And solicitations tend to be accompanied with
7 what's called a pre-bid workshop. So this is after a
8 solicitation is released and is live, we'll hold a workshop
9 to present that solicitation and take questions from
10 potential bidders or from the public. And typically, our
11 practice is to release answers to those questions before
12 applications are due.

13 And then applications are typically evaluated by
14 a scoring committee. That committee uses the criteria that
15 is published within the solicitation.

16 And following that review, the Energy Commission
17 releases what's called a Notice of Proposed Awards, and we
18 move directly into executing on the agreement and
19 presenting that to our full Commission for their review and
20 consideration at a publicly-noticed business meeting.

21 At this point, we do not have a live solicitation
22 out. That's why we're doing this workshop now, so that we
23 can help develop that solicitation. And throughout the
24 workshop today, we'll do our best to answer questions and
25 respond to questions. But for the most part, we'll

1 probably be able to take questions. And I'll be working
2 internally with our Chief Counsel's Office, as well as our
3 own transactions teams on considering what those questions
4 have for us to think about.

5 Again, on the screen there is a link to where our
6 main funding web page is. In addition to seeing examples
7 of grants and other types of funding or processes, we have
8 resources on that page that I would suggest becoming
9 familiar with.

10 Next slide, please.

11 So we started to think about what a grant
12 solicitation might look like. As I mentioned, there are
13 requirements that are placed inside of a solicitation. And
14 so as we're starting to think about these, the first thing
15 that we have to do is we have to look at the statutory
16 framework and say, okay, here are the statutes that were
17 passed, here is the law that we have to implement. What
18 would this look like inside of a solicitation itself?

19 And so after covering that background as well as
20 what a grant funding opportunity is, I wanted to go in and
21 start to share some of the things that we're thinking about
22 in terms of requirements. All of this is open to public
23 comments and discussion today. So this is merely something
24 that we're considering but hasn't, you know, put itself
25 into a grant funding opportunity at this point.

1 So I wanted to start with Category 1 and some of
2 the activities that fall within the statutory language that
3 we are considering for potentially making requirements, or
4 perhaps bonus points, in one or more of these solicitations
5 under this program. And again, we're interested in your
6 comments, reactions regarding feasibility, practicality,
7 the timing, any strategy, necessary funding possibly for
8 some of these activities, or any other aspects of these.

9 So Category 1, some of the key words include
10 things like planning and environmental analyses. And when
11 we think about that in terms of developing ports and
12 harbors and waterfront facilities to prepare for offshore
13 wind, some of the immediate things that come to mind that
14 are probably in addition to the more technical aspects of
15 doing that, that aren't called out specifically, but
16 planning and environmental analysis are things like
17 identifying potentially impacted communities, creating
18 communication engagement plans with those communities.

19 And we think of things such as those communities
20 that are near ports and harbors where projects are being
21 pursued include things like under-resourced communities,
22 federal and non federally-recognized tribes. And we also
23 think about users of ports such as the commercial fishing
24 fleet and others that use ports.

25 Also, we think it's important in these early

1 stages to be identifying potential impacts of the proposed
2 project or concept and strategies to address those. We've
3 heard a lot in developing the AB 525 strategic plan.
4 That's part of the framework actually of the AB 525 bill is
5 the strategies around labor and workforce for that labor
6 and workforce that's nearby ports and harbors. The
7 potential for opportunities for, I guess, I'll say green
8 manufacturing movement and construction or, you know, ways
9 that offshore wind could be planned for and upgrades could
10 support using, you know, low emission technologies and
11 really using more advanced and alternative technologies.

12 And then also under the Category 1 where there's
13 mention of creating business plans potentially with these
14 funds, we think it's prudent to have part of that to be --
15 the funding to be used to come up with investment
16 worthiness. An example of that could be a return on
17 investment or a net present value to a level that public
18 and private investors can make informed decisions.

19 So these are some of the requirements we're
20 starting to think through for the Category 1 solicitation.
21 And again, all of these are open to reaction and comments
22 and your ideas.

23 Next slide, please.

24 Okay, again, going into Category 2. So I would
25 say that a lot of the requirements that were shared for

1 Category 1 could equally apply in the Category 2-type
2 grants. And we are interested again in comments and
3 reactions regarding feasibility, practicality, timing,
4 strategy, necessary funding, or any other aspects of these.

5 So in addition to some of those Category 1
6 examples that were provided, we also think that there could
7 be some prudence, I guess, with working with OEMs, or
8 original equipment manufacturers, as well as the offshore
9 wind developers. And that probably is especially true for
10 the current leaseholders and really want to kind of push
11 that to be in a purposeful way, so maybe through something
12 like a technical advisory committee or a team.

13 And then also a strategy around looking at the
14 availability of federal awards and plans for applying to
15 those federal programs. As I mentioned, there's the
16 Category 3 that we have that can allow for match funding.
17 We didn't run -- we don't have requirements that we've
18 spelled out here today that we're thinking about because
19 that seems pretty clear. But for those who are receiving
20 funds for Category 1 or two, especially Category 2, being
21 able to use some of the grant funds to come up with a
22 strategy for applying for federal programs.

23 Next slide, please.

24 So we talked a bit about the requirements that
25 we're considering in a potential solicitation under those

1 categories. And we're also starting to think through the
2 criteria that can be used to evaluate grant applications.
3 Again, the criteria is something that we are looking for
4 your comments and reactions on, the feasibility of this,
5 practicality of some of these, and any other aspects of
6 them.

7 The criteria, if you do review any of the current
8 grant funding opportunities or past grant funding
9 opportunities the CEC has, there is a lot of standard
10 criteria that's used to screen applications. But every
11 solicitation also has its own criteria that it tends to
12 focus on. And some of those common criteria are things
13 like cost-effective. Sometimes you'll see things like in-
14 state spending or other ways that the money is going to be
15 spent and on who. So we might not be using the exact same
16 criteria as some of those that are spelled out in some of
17 those examples, but we will be thinking through criteria
18 that is more specific to the program itself.

19 And so some of that specific criteria we're
20 beginning to explore are things like how consistent an
21 application is with some very key parts of the Assembly
22 Bill 525 Strategic Plan. So in that plan, if you have not
23 been following along or been able to read some of those key
24 parts, the AB 525 requires the CEC to prepare a plan to
25 improve waterfront facilities to support the development of

1 offshore wind. And so we're looking at if that plan is
2 approved by the CEC at a business meeting, that we would
3 really look to that as having some strong weight to guiding
4 us in how we evaluate applications, so consistency with
5 what's adopted there.

6 Further applications that include plans to
7 consider benefits to under-resourced communities is
8 something we could include bonus points for.

9 Another possible criteria is the ability of the
10 applicant to meet the needs of the first five BOEM
11 leaseholders. And so we might also include bonus points
12 for any match commitment that applicants have.

13 Another one that I wanted to bring to everyone's
14 attention that we're also thinking about the relationship
15 between this funding program and a new statute that was
16 just added this year by the legislature and signed by the
17 governor is Assembly Bill 3, which directs the Energy
18 Commission to prepare a second phase plan and strategy for
19 seaport readiness. And that plan is supposed to build upon
20 the recommendations and alternatives in AB 525.

21 The plan isn't due until December 31, 2026. So
22 we may use ideas that are developed with the funds in this
23 program as something that can help inform our work in AB 3.
24 And we're looking at maybe potentially either using that as
25 an evaluation criteria or possibly a requirement.

1 So again, these are all potential requirements in
2 a solicitation. We still need to unpack these and
3 determine their applicability to the statutes themselves.
4 But part of that effort is the workshop today, as well as
5 the public comment opportunity.

6 Next slide, please.

7 So these are questions that I hope that those who
8 are preparing public comment, especially the written
9 comment, we're hoping to hear some of the perspectives to
10 these. These are by no means the only questions that we
11 have or the only questions you may have. But these are
12 consistent with some of the requirements that we just
13 shared or the potential requirements that we just shared.
14 And so we welcome your feedback and comments and, you know,
15 I guess, challenge you to take us up on the questions that
16 are here to respond to within your comments.

17 We do have interest in learning more about the
18 federal funding awards that are there and those
19 opportunities. I think at the beginning of the workshop,
20 the Chair mentioned that this program is like a down
21 payment to a much larger investment. And Jennifer, you had
22 mentioned that, as well, in your opening comments. We also
23 see the program hopefully as being able to position itself
24 to attract federal investments. And so we'd be really
25 interested in understanding how the work that would be done

1 by anybody who receives funds for this, how that work could
2 help set up those applicants -- or those recipients to be
3 able to attract federal funding into the state.

4 Next slide, please.

5 Next steps for us. We've begun to put together a
6 state agency team that's helping us advise the program. So
7 we are engaging with the California Coastal Commission, the
8 State Lands Commission, the Department of Fish and
9 Wildlife, the Governor's Office of Business and Economic
10 Development, as well as the California State Transportation
11 Agency. This is a small team that's there to help advise
12 us as we go through the program itself.

13 We've also begun some informal outreach to ports
14 and harbors, as well as the offshore wind industry. That's
15 part of how the workshop came together -- part of how this
16 workshop came together today is beginning to build
17 relationships with a lot of the people that are on the
18 panel with us today. And we plan to continue doing that
19 informal outreach in addition to this public workshop.

20 There is a webpage for this program on the
21 website, which is at the URL there on the slide. You can
22 also sign up for a LISTSERV that we'll use to push
23 communications out about this program. And there's also a
24 separate public record docket that's been established that
25 you can also access there.

1 If you've been engaged in offshore wind and the
2 Energy Commission's process, we've used a single docket for
3 offshore wind since 2017, I believe we opened it, 2016.
4 And that docket is equally important, but we wanted to
5 create one single place for the record just for this
6 program.

7 And our next steps in terms of getting into the
8 solicitation steps, we are considering an additional
9 workshop in the future or some additional public process
10 around possibly having out a solicitation concept or a
11 paper that folks can react to. I think we want to kind of
12 see how the workshop goes today and the public comments
13 through December 1st before we know if we'll have to take
14 that step to have an additional workshop.

15 We are thinking of one or more funding
16 opportunities to come out in the first quarter of next year
17 and being able to make any first grant awards by the second
18 quarter of next year.

19 And throughout this, for us, it's really
20 important to continue to have a public and transparent
21 process around this program. One, it puts people who
22 potentially could be applying to this on notice, but it
23 also allows the public an opportunity to help us get the
24 program implemented right.

25 And we're also going to be awaiting the AB 525

1 Strategic Plan, because as I mentioned, there is a key
2 piece of that. That's a pretty wide-ranging -- it has a
3 pretty wide range to that Strategic Plan, but there's going
4 to be some really key parts and analyses that we're going
5 to be relying on for this program to help inform us.

6 Again, public comments are due, we're asking for
7 them, by December 1st, so please submit written comments.
8 At the end of the slides today, I'll have a reminder on how
9 you can do that. If you haven't submitted comments to the
10 Energy Commission before, we have an e-commenting system.
11 It makes it very simple to submit comments, at least I hope
12 it's simple. And then I'll go over some other ways that
13 comments can also be submitted.

14 Next slide.

15 And so thank you. That's my presentation. My
16 name and email address are on the slide. My colleague
17 Lizzie Barminski, who works with me in the Division, is
18 also helping lead and implement this program. Her email
19 contact information is also on this slide. You can reach
20 out to either of us or both of us if you have questions.
21 The URL again is on here for the program web page.

22 And that covers my presentation. So I think what
23 we're going to do next is we are going to transition into a
24 panel.

25 So next slide.

1 All right, that's a lot of names. This is great.
2 So I first want to just say thank you to the ports and the
3 harbors who are with us today, to Moffatt and Nichol, who's
4 with us today. A few folks are online, so we're going to
5 be transitioning between those in person and then those
6 online.

7 This is the order that we'll go in for these
8 presentations today. We're going to start with a
9 presentation by Matthew Trowbridge, going over a lot of the
10 work that Moffatt and Nichol has done in the last two
11 years, I guess, he's probably covering. And then we'll go
12 through individually, ports and harbors to hear
13 perspectives on work you're currently doing, work you're
14 thinking about doing, concepts that you have regarding
15 improvements at your facilities to support offshore wind.

16 I will ask, because we are having the workshop
17 transcribed today, that before you start your presentation,
18 for the court reporter, please state your name and your
19 organization.

20 And so I think we are ready to go into the
21 presentations, and I'll pass it over to Matt.

22 And next slide, please, Hilarie.

23 MR. TROWBRIDGE: All right. My name is Matthew
24 Trowbridge with Moffatt and Nichol. I really appreciate
25 the opportunity to speak today. I'll be, as Eli mentioned,

1 touching on work that's been going on over the past couple
2 of years, looking at California port readiness to support
3 offshore wind. I'll be presenting -- all the information
4 in these slides is based on federal and state studies that
5 have been completed. Some of the ports up here on stage
6 have been doing their own studies, their own work. That
7 work is not included in this presentation. This is only
8 covering the work that's been captured by the federal and
9 state studies.

10 Next slide.

11 So we'll do just a brief introduction. We'll
12 take a look at all of the California port readiness
13 studies, as well as discuss the outcomes from the AB 525
14 Port Readiness Plan. And at the end of this set of slides
15 will be the key takeaways from these studies, as well as
16 work that has not yet been completed to date.

17 Next slide.

18 So a little bit about who we are. I work for a
19 company called Moffatt and Nichol. We are port
20 infrastructure consultants. We've been working in and
21 around our California ports and our California coastline
22 since 1945 when we worked to build up the Navy shipyards in
23 Long Beach. We work pretty much all along the California
24 coast and we've worked for essentially all of our
25 California ports and harbors. And we focus on all of our

1 business lines in the ports. So offshore wind is one of
2 those areas we focus on, but we also work for all the other
3 types of cargo and terminals and facilities that are in and
4 around our ports and harbors.

5 I'm a marine structural engineer by training. I
6 do a lot of work in our ports in California and I have a
7 specialty in offshore wind ports working here on the West
8 Coast, working on projects in the Gulf Coast, as well as on
9 the U.S. East Coast.

10 Next slide.

11 So this slide shows a summary of some of the key
12 studies that were produced over the past couple of years,
13 both at the state and federal level. And the first three
14 studies were funded and completed by the Bureau of Ocean
15 Energy Management. And these studies really are
16 foundational studies that provide a lot of key information
17 that led into the AB 525 Port Readiness Plan. The Port of
18 Coos Bay study had significant industry outreach to
19 developers and OEMs to understand what is the wind industry
20 looking for in our ports? What do we need to prepare our
21 ports to provide to the industry? And then there was two
22 California regional port studies looking at our California
23 ports.

24 Next slide.

25 Then this slide is showing all the same studies

1 on the left, but as we get into the State Lands Commission
2 studies, there were two produced, key studies, by the State
3 Lands Commission. The first one was looking at, okay,
4 we've studied all of California's ports in those BOEM
5 studies, but what if we build a new port or a new port
6 facility somewhere on the California coast, what would that
7 look like? What would that be? And is that a better
8 alternative versus using our California ports? So that was
9 the alternative port assessment. And all of that
10 accumulated and was really summarized and built upon in the
11 AB 525 Port Readiness Plan that was published in July.

12 And also of note, there was another study, a very
13 similar study that was completed by the National Renewable
14 Energy Lab that was a full West Coast port study looking at
15 not just California, but also how could Oregon and
16 Washington participate in this industry and how could
17 additional gigawatts of energy that come online potentially
18 in Oregon and Washington be available for California ports
19 to participate in?

20 Next slide.

21 So why are we talking about ports when we talk
22 about offshore wind? Well, just fundamentally, there's
23 three main things that we need to make offshore wind go in
24 California. The first is we need strong wind, which we
25 have on our coast. We need an electrical grid and

1 transmission system that moves that energy from the
2 offshore, 20 miles offshore, to the population centers.
3 And we need ports and port terminals to provide the supply
4 chain for this industry to get built.

5 And so it's really key that we have these port
6 facilities, these sheltered harbor areas with large lay
7 down space, deep navigable water, and really heavy load
8 capacity that can allow the offshore wind industry to
9 construct these turbine systems and then tow them fully
10 assembled out to the offshore wind area where it will be
11 installed.

12 There's an example of a turbine system shown in
13 the upper right-hand side of the screen. To meet
14 California's goals of 25 gigawatts by 2045, our California
15 ports need to construct approximately 1,300 of these
16 systems and deploy them offshore. So this is a significant
17 undertaking that needs to occur in the next -- in the
18 coming years.

19 One really key outcome from these studies is
20 there is no existing port terminal on the West Coast that
21 is currently configured or built in a way that can support
22 the very heavy and infrastructure heavy demands that this
23 industry needs. And so our ports have the space to support
24 the industry but need significant investment to improve our
25 port facilities such that we can build out these wind

1 farms. And it's going to require multiple ports and all
2 the ports up here on the stage today to participate in this
3 industry to realize this goal of 25 gigawatts by 2045.

4 One really key aspect of this program that as we
5 develop these studies, one really key focus area is that
6 this is a brand new maritime industry. And it's really
7 important that when we look at building out this industry
8 that we do not displace or replace any existing maritime
9 users in our ports and harbors.

10 Next slide.

11 So some of the feedback that we received early on
12 through a lot of outreach to the industry, to developers
13 and OEMs, is summarized on this slide. And ideally in a
14 perfect world, the wind energy areas, the port sites and
15 the electrical demand, the population centers would all be
16 located right next to each other, but that's just not the
17 reality in California. We have wind areas that are far
18 away from our population centers that are not
19 necessarily -- the wind energy areas aren't necessarily as
20 close to the ports as we would like.

21 So we have to figure out a way to make this
22 industry work with the constraints that we have on where
23 the wind blows, where our ports are and where our
24 population centers are that are needing the energy. We
25 need to plan for turbine systems that are up to 25 megawatt

1 in capacity and I'll talk about that in a future slide.
2 Here on the West Coast we're talking about floating
3 foundations. So in that bottom right hand corner of the
4 screen, those are all the different feasible types of
5 foundation systems for offshore wind.

6 On the West Coast our water depth drops off
7 considerably very quickly, the Pacific Outer Continental
8 Shelf drops out to a water depth that only floating
9 foundations are feasible on the West Coast. And really,
10 we're going to be focusing on two types of floating
11 foundations, the semi-submersibles and the tension leg
12 platforms.

13 One key thing we need to solve in the industry is
14 figuring out how we transfer those foundation systems from
15 where they get built in a port on land into the water.

16 And then another key requirement in this industry
17 is that we have lots of wet storage space in our ports
18 where we can safely moor floating foundations and
19 integrated turbine systems. This really acts as a pressure
20 relief valve or a risk mitigation for the developers when
21 they're installing the turbine system to have extra
22 capacity to mitigate the risk of downtime and weather and
23 other types of congestion as they're moving these turbine
24 systems to the final installation area.

25 Next slide.

1 Okay, so this slide shows the design turbine
2 system that the industry has coalesced around. It's a
3 turbine system that's up to 25 megawatts in capacity and
4 our ports need to design to be able to accommodate turbine
5 systems up to this size. So we're looking at foundation
6 beam widths of up to 425 feet, and we're looking at water
7 depths after integration up to 50 feet, and the blades that
8 we're planning for from the water surface to the tip of the
9 blade is approximately 1,100 feet off of the water surface.

10 Next slide.

11 This slide shows an approach that is most
12 commonly associated with how we're going to build and
13 deploy these turbine systems. It starts with step number
14 one of basically fabricating foundation subcomponents and
15 moving those subcomponents to a port facility where they
16 will be assembled together to create the floating
17 foundation.

18 That floating foundation will be moved from land
19 into water. One method of doing that is shown on the
20 screen, steps two and three, which is a semi-submersible
21 barge where you roll the foundation onto the barge, move it
22 to a sinking basin, sink it down, float the foundation off.

23 And then the next step would be moving that
24 foundation system to a integration wharf where a heavy lift
25 crane places tower sections, nacelle and blades on top and

1 eventually tows the fully completed turbine system out to
2 the wind energy area. Possibly, before it gets towed, it
3 may spend some time in wet storage.

4 And, also, I've mentioned steps two and three.
5 There are a handful of other methods that are being
6 evaluated for moving those foundation systems into the
7 water.

8 Next slide.

9 There are a number of different types of port
10 facilities that the industry needs to meet the state's
11 goals. We're going to be focusing on a couple of these
12 sites here in today's presentation.

13 One of the key types of sites that we're looking
14 for is what we call a staging integration site. This is a
15 terminal that will receive large wind components, stage
16 them and then do the final integration, build the final
17 turbine system prior to towing to the offshore wind area.

18 Another key site is what we call a manufacturing
19 and fabrication site. That's a site that will receive raw
20 materials. And the manufacturing sites at our ports, the
21 reason we're talking about them is at a certain point in
22 the supply chain these wind components get so big and so
23 large and so heavy that they can only be moved by
24 waterborne transit. They cannot be moved by road or rail
25 and that's why they're so critical to be at our ports.

1 Another type of important site we'll talk about
2 is what we call operation and maintenance. And these are
3 really the base of wind farm operations where you're going
4 to have workers moving to and from this facility and out to
5 the wind farms on a regular basis to support the regular
6 operations and maintenance of the wind farm.

7 And the last types of facilities that we'll touch
8 on today are what we call construction support facilities
9 which are the base of construction operations or areas
10 where we can lay down components prior to going out to the
11 wind area and installing the mooring lines, anchors,
12 electrical cables.

13 Next slide.

14 Okay, this slide is showing a table of the types
15 of demands on our port facilities for different types of
16 uses. So on the left hand side of this table, the left two
17 most columns is where we're looking at staging integration,
18 foundation assembly, and manufacturing site uses. These
19 are the most infrastructure-heavy demands on our ports.
20 They require the most amount of space. They require the
21 heaviest amount of loading, the most amount of most length
22 of wharf. You can see a range of acreage here of 30 to 100
23 acres, but really the industry is looking for these types
24 of sites of at least 60 acres. They'd really like to have
25 somewhere between 60 to 100 acres for these types of sites.

1 And when we look at the loading requirements, the
2 wharf loading requirement of more than 6,000 pounds per
3 square foot, when we compare that to a typical container,
4 about six times the capacity. So these are very, very
5 heavy loaded structures that don't exist yet that need to
6 be built. And that requires a big investment into our
7 ports.

8 As we move towards the columns on the right of
9 this table, we get into some types of infrastructure
10 demands that are much more common in our ports. An O&M
11 type use or anchor, mooring line, construction support,
12 electrical cable, lay down sites, those sites can be
13 accommodated much more easily in our ports without as much
14 investment as the two left most columns.

15 Next slide.

16 Okay, so one of the big outcomes of the AB 525
17 port readiness plan was an identification of how many port
18 sites do we need to meet the state's goals? And do we have
19 enough locations within our California ports to meet these
20 needs?

21 And so this table and the report really assume
22 the worst case. If we tried to locate all of the Tier 1
23 manufacturing sites in California, if we attract all of
24 that manufacturing to California, that we build all of the
25 blades, all of the towers, all the nacelles, all the

1 foundations and subcomponents here in California, how much
2 space would we need? And the big outcome from this is that
3 when we looked around at the ports and did a lot of
4 outreach to our ports, we found that, yes, our ports and
5 harbors are very well positioned to support the state's
6 goal, even on this conservative assumption by 2045. But
7 the key aspect is that there's adequate and timely funding
8 into our ports in order to help meet these goals.

9 Just a side note on these, when we talk about
10 number of sites for these studies, we're assuming,
11 especially for the larger types of sites, the S&I and the
12 foundation assembly, we use an average size of a terminal
13 of about 80 acres. We call that a site. And that's a way
14 that we can reference across studies to show how many types
15 of these sites we need.

16 Next slide.

17 Okay, so I want to present a couple of slides
18 here on the key takeaways from these studies. We need to
19 plan for turbine systems, 15 to 25 megawatts of capacity.

20 One big takeaway is that these types of projects
21 in our ports are not commercially viable using traditional
22 port business and financing models. The cost of these
23 terminals and infrastructure demand, the financing
24 available cannot be done on leasing back and earning back
25 the revenue through leasing, so it's very important.

1 And really this is what you saw on the U.S. East
2 Coast, all of the port improvement projects on the East
3 Coast had significant state and federal funding in order to
4 get the ports ready to support the industry, which then
5 unlocks the economic impact and jobs to the state.

6 So with that adequate investment in our
7 California ports, we will be ready to meet the goals of 25
8 gigawatts by 2045.

9 The most urgent funding need in our ports is
10 those staging integration sites. They are the absolute
11 most critical sites that need funding as soon as possible
12 because they're going to be the first sites that need to be
13 developed to support the industry.

14 The manufacturing sites are also critical,
15 they're also important sites because when we develop those
16 sites, we're maximizing economic benefits and job creation
17 for the state.

18 Next slide.

19 The study, when we looked at all of the ports in
20 California, it boiled down very quickly to three sites that
21 would be potentials to supporting staging integration and
22 really those are Port of Humboldt, Port of Long Beach and
23 Port of Los Angeles. And the ports will talk about it
24 today, but Port of Humboldt and Port of Long Beach have
25 progressed their projects pretty far to date and are in the

1 environmental document and preliminary engineering phases
2 of their projects in order to prepare them to support S&I
3 for the state.

4 Next slide.

5 So some of the key takeaways. To get to that
6 gigawatts by 2045, the report estimates that we need three
7 to five S&I sites and four foundation assembly sites. Each
8 of those sites needs to be at least 40 acres. And it's
9 likely for the S&I sites that we really need somewhere like
10 four to five of those. Three would be if everything was
11 absolutely perfect and there was no inefficiencies in the
12 system.

13 So when you add up all this acreage for the
14 demand, you see that you really need all of the acreage
15 that Port of Humboldt and Port of Long Beach can provide in
16 their projects. You really need both projects. And if you
17 don't have both Port of Humboldt and both Port of Long
18 Beach providing S&I and foundation assembly, then it will
19 not be possible to meet those state goals.

20 Another key takeaway is that while it may be
21 feasible to build a new port in central California, it
22 would be possible to do that, that would be a significantly
23 more costly endeavor. It would create more environmental
24 impacts and have a much longer development schedule than if
25 we build inside of our existing ports for staging

1 integration.

2 Next slide.

3 One key point on this AB 525 work was that there
4 was a detailed towing assessment that was done. And what
5 it found, the really big key takeaway here was that it's
6 feasible to tow fully assembled floating turbine systems
7 from any of the S&I ports in California to any of the wind
8 energy areas. So, you know, in practice, this means that
9 Port of Humboldt can move turbine systems from Port of
10 Humboldt to the northern California wind energy areas and
11 the central California wind energy areas and vice versa.
12 Fully assembled turbine systems could be towed from Port of
13 Long Beach to both the central and northern coast wind
14 energy areas.

15 And not just that it's feasible, but also that
16 it's really going to be needed when we look at a demand and
17 capacity equation. You know, Port of Humboldt will be
18 coming online sooner. Their project is anticipated to be
19 done sooner. And so it's likely that they will need to be
20 towing to Morro Bay until Long Beach is built and vice
21 versa. Humboldt does not have enough capacity to build out
22 all of the north coast wind energy areas and all the north
23 coast capacity. So it will need -- it will require Long
24 Beach to send turbines up to the north coast in order to
25 meet our goals.

1 Next slide.

2 For the manufacturing ports, there's a figure
3 here showing all of the key options for manufacturing
4 within the state. These are the ones that provide that
5 significant job creation economic impact. And you know,
6 from San Diego, Long Beach, LA, the Bay Area ports and Port
7 of Humboldt are all positioned to support manufacturing
8 supply chain. And this key question that Eli touched on
9 with AB3 is really how much manufacturing, how much supply
10 chain is the state going to incentivize to happen in
11 California? And this will drive how many of these ports
12 are participating in the supply chain.

13 Next slide.

14 For the O&M ports, we estimate that the state's
15 going to require somewhere between 9 to 12 -- 9 to 16
16 sites. Each of those sites has a berth to support O&M
17 vessels and some upland lay down area. Sites would be
18 needed both on the north coast and the central coast. And
19 it's possible that you could have multiple sites within the
20 same port. So for example, Port of Humboldt may have a
21 handful of O&M sites supporting all of those north coast
22 wind energy areas.

23 Next slide.

24 Okay, so for the cost, and Jennifer touched on
25 earlier but when we add up the estimated improvements into

1 our ports to meet these goals, we get to a total cost of
2 around 11 to 11 to 12 billion dollars. And we've broken it
3 down in this table to show each type of site use. And you
4 know, the key here is that, again, we're driving all of the
5 manufacturing investment in the state. So this is what we
6 anticipate to be the maximum investment requirement for
7 manufacturing within the state.

8 There's a couple key assumptions here. These
9 estimates are done in 2023 U.S. dollars, so they're not
10 accounting for inflation. There's a 50 percent contingency
11 on these numbers in that they're early estimates. There's
12 not been engineering work done to drill down on the
13 accuracy for these numbers, so it carries a high
14 contingency as well as a high accuracy band.

15 These costs are only for port improvements. So
16 basically anchor bolts down, this is dredging, sinking
17 basin, wharf, land creation, those kind of things. It
18 doesn't include above grade improvements like equipment
19 costs like cranes, SPMTs. It doesn't include buildings and
20 things like that. So there are some additional investments
21 that are not accounted for in these numbers.

22 And there's a handful of other assumptions in the
23 final report that I would reference to.

24 Next slide.

25 Okay, so what was not done as part of this work

1 to date in these state and federal studies? Well, one of
2 the big items that hasn't been done yet is a really good
3 assessment of our shipyard capability to build out the full
4 fleet of vessels that's required to support this industry.
5 There are going to be a lot of vessels that need to be
6 built from tugs to O&M vessels, barges, semi-sub, cable
7 lane vessels, and crew transfer vessels and service
8 operation vessels. So there's a lot of different types of
9 vessels to be built and somewhere we need to confirm that
10 there's enough capacity in the U.S. to meet the needs and
11 have these vessels ready in time to serve the industry.

12 There was a handful of port space or port
13 capacity items that were not captured in these studies. We
14 didn't look at port space required for home port services
15 for the tug fleet. We didn't look at space in the ports
16 required for end-of-life decommissioning. So at the end,
17 you know, after 20 years when these turbine systems are
18 done, they'll need to be probably towed back to a port and
19 they will need to be some space in the ports to accommodate
20 that decommissioning process.

21 There's some additional demands in our ports,
22 flexible lay down, Tier 2 and Tier 3 manufacturing supply
23 chain, which were not studied.

24 And we also didn't look at the offshore
25 electrical substations and where those will need to be

1 built. Those may also require some port capacity in the
2 state.

3 And then as already mentioned, how much of our
4 supply chain and manufacturing will be incentivized and
5 built into California versus, you know, we studied 100
6 percent. It may be something less than that.

7 So with that, I think that's the end of my slide
8 deck. And again, I really appreciate the opportunity to
9 speak today.

10 MR. HARLAND: Great. Thank you so much, Matt,
11 and more exciting than running through a bunch of statutes
12 to see that, so appreciate it. And also apologies, Matt,
13 we integrated your slide deck in there and I noticed some
14 of the formatting was off. So usually you have an
15 impeccable slide deck. So sorry about that.

16 And so next up is going to be Rob. And speaking
17 of slide decks, Rob, you're going to be able to pull up
18 your own because it would have been impossible to integrate
19 that into our slide deck. Again, before your presentation,
20 your name, organization for the court reporter. And if you
21 can keep it right around ten minutes, that would be
22 fantastic.

23 MR. HOLMLUND: You got it. I'm Rob Holmlund,
24 development director for the Humboldt Bay Harbor,
25 Recreation & Conservation District, also known as the

1 Humboldt Bay Port Authority. And I'm going to jump right
2 into this.

3 So let's see, just a quick introduction to
4 Humboldt Bay, way up in the North Coast. Some people may
5 not be familiar with what we've got going on. So here are
6 the two lease areas that currently have been leased off the
7 California coast. And if you zoom in on the northern one,
8 you can see Humboldt Bay right there in very close
9 proximity to the Humboldt lease area.

10 The Port of Humboldt Bay is situated in a
11 beautiful part of the country. You can see all the trees
12 there. Just to the north of us is Redwood National Park
13 and south of us is Redwood State Park. We have a really
14 rugged coastline. But the Port of Humboldt Bay is a port
15 of refuge that kind of interrupts that rugged coast to the
16 north and south of us.

17 It is a mecca of recreation, a lot of kayaking
18 and conservation programs that we work on throughout the
19 bay. And we have a very active commercial waterfront. The
20 largest fishing fleet on the north coast. The majority of
21 oysters in California are produced in Humboldt Bay. We
22 receive cruise ships every year.

23 But what we're known most for as a port is the
24 wood product and timber industry and export of those
25 materials. And we have a long legacy in the bay of break

1 bulk related to wood products. And in the 1990s, a lot of
2 these sites were still active. But 2008 or so, one of the
3 last mill sites on the bay closed. And the industry really
4 hasn't seen its peak since the 1950s, 1960s.

5 So this is the site I'm going to be talking about
6 in a moment where our offshore wind project is proposed.
7 And you can see just the density of activity at this site.
8 It was the largest employment center for three consecutive
9 generations in the region. And if you keep your eye on
10 that redwood dock to the left there, this is what the site
11 looks like now. It's effectively vacant. And so a place
12 that was, you know, a job center for multiple consecutive
13 generations is now effectively vacant.

14 Zooming out and looking at Humboldt Bay, we -- so
15 there's the city of Eureka, cities of Arcata -- or City of
16 Arcata and Cal Poly Humboldt University up there, the
17 College of the Redwoods, and the Wiyot Tribe just for
18 context.

19 If we turn this map to the right, north is to the
20 right, and overlay this map on top here, you can see the
21 teal areas are the federal navigation channels maintained
22 by the Corps of Engineers. And the purple areas are those
23 coastal-dependent industrially zoned lands that were almost
24 entirely related to the wood product industry. And with
25 this point, we have about 300 to 600 acres of vacant or

1 heavily underutilized industrial lands. The green area is
2 among those and that is the project site I'm going to be
3 talking about.

4 And so this is a Master Plan from several years
5 ago to envision what we could do at that site. That came
6 from a study over ten years old, where we looked at this
7 site, what could be done with it. And so there was a whole
8 lot of evaluation over ten years ago of cargo dock,
9 aquaculture, but notice that we even back then were
10 evaluating offshore wind.

11 And so based on that initial study, when offshore
12 wind really started to heat up, we received a \$65,000 grant
13 from the Humboldt County Headwaters Fund to advance this
14 concept. And then utilizing money, a grant from the State
15 Lands Commission, \$500,000 in 2021, the California Energy
16 Commission realized that we could be getting somewhere with
17 offshore wind and granted us a \$10 million grant to advance
18 this project.

19 We leveraged that money and just announced this
20 morning, we have received a Port Infrastructure Development
21 Program grant for \$8.5 million. So altogether now, we're
22 just under \$20 million, which gets us about one-fiftieth to
23 one-one-hundredth of the way there for our project. So we
24 have a long way to go. We did submit a over \$400 million
25 grant with a \$400 million private match. And we should

1 hear about that in December or January. And then, you
2 know, future grants opportunities, we are evaluating many
3 of them. And obviously we're looking to stimulate private
4 investment through all of this public funding.

5 So this is one of the latest drawings of the
6 concept. We actually have more complex drawings, but
7 they're not quite polished enough for this presentation, so
8 it's easier for me to use this one.

9 And so just for a review of what we're looking at
10 to do in our project here, we have 600,000 square feet of
11 manufacturing, so for instance, blade manufacturing there.
12 But also acknowledging that, as Matt's presentation pointed
13 out, staging integration is the most critical. And so if
14 we could maximize the whole site for staging integration,
15 it's more likely that all of the components could be
16 manufactured in other ports throughout California and
17 shipped to this site.

18 And our general philosophy is there's enough
19 wind to go around. So we believe in all of the other ports
20 projects, heavily and consistently supportive of all of
21 their projects. And so we can receive our manufactured
22 components from elsewhere.

23 Same with the floating foundations. You know,
24 this is an assembly line of putting them together, but you
25 can see on the far right that we would be receiving

1 components from other ports. And so this is a floating
2 foundation here in the bottom right-hand corner. You can
3 see a little person. So these are really massive pieces of
4 infrastructure.

5 So coming in, going through this assembly line,
6 once it's fully assembled, then go onto the semi-
7 submersible barge where it is launched into the water. And
8 then once the floater is in the water, then it can be taken
9 over to a wet storage area, so it would be sitting in the
10 bay, or immediately taken over to the wharf and crane here
11 where vertical assembly would occur. And so you can see
12 some samples from other parts of the world where the
13 vertical assembly process happens. Each of the tower
14 sections go up, then the nacelle, then the blades are put
15 on.

16 Once everything's fully assembled in the water,
17 then it gets towed from there out of the bay to the various
18 lease areas, either Morro Bay, Humboldt, or future lease
19 areas. And honestly, before it gets towed out, it would
20 likely come over here to an on-terminal wet storage area
21 for final inspection and completion before it's towed out.
22 Then we have a whole other wharf doing the exact same thing
23 so that we can do two of this arrangement simultaneously.

24 We're actively working on tow-out modeling, and
25 there's quite a bit going on with the project right now.

1 And as we understand, a lot of these turbines, once they're
2 out in the water, will need to come back into a port for
3 maintenance. And so our site is set up to be able to
4 handle that level of operation and maintenance for the
5 facilities as well.

6 Looking deeper into the future, you can see
7 future Oregon lease areas and the proximity of Humboldt Bay
8 to those. But you can also see that just north and just
9 south of Humboldt is the best wind resources on the west
10 coast of the United States. So the two lease areas that
11 are currently in the water of California are not enough for
12 the state to reach its goals. And so we anticipate that
13 future lease areas will be very close to Humboldt. And
14 this is from an NREL study several years ago that points
15 out areas of interest in Del Norte and Mendocino validating
16 our assumption that we will be very close to future lease
17 areas.

18 Also thinking about towing distances, I just
19 threw this together this morning and looking at a radius
20 from Long Beach, a radius from Humboldt and where the
21 various, you know, current Morro Bay and Humboldt wind
22 energy areas come in relation to tow distances.

23 So a quick status report on where our project
24 sits at the moment. Our Board has approved a project labor
25 agreement. We are working closely with the county of

1 Humboldt Economic Development Department, the Cal Poly
2 Humboldt, and College of the Redwoods on a workforce
3 development strategy.

4 We are deep into a business plan. We are
5 actively engaged with seven different tribal governments,
6 meeting with some of them on a weekly basis at this point.

7 We adopted a community engagement strategy this
8 past June. And so we have identified dozens of
9 stakeholders and engaged with fishermen and a long, long
10 list of different community members. We are working on
11 establishing a community advisory committee, a community
12 benefit program.

13 We're deep into CEQA NEPA permits and 30 percent
14 design. I should say that using the California Energy
15 Commission grant, we did a competitive bid process and
16 hired Moffatt & Nichol, who has been with us since March of
17 '22, and they are leading all of these permitting and
18 design efforts.

19 Just yesterday, we spent three hours with 48
20 different agency staff from 11 different agencies, every
21 agency that's going to be issuing a permit to this project,
22 had a really productive meeting on mitigation planning. We
23 have a robust eelgrass mitigation strategy.

24 We were working on a green terminal plan.
25 Working with the county, an Enhanced Infrastructure Finance

1 District has been established at the project site and
2 around it.

3 Looking at project schedule, I'll skip over the
4 detail. Just in summary for schedule, we plan on
5 completing CEQA NEPA and permits in Q1 of 2025. The
6 mitigation construction could begin in late '25. Phase one
7 project construction beginning in '26, and ready for
8 operations in 29.

9 So in conclusion, I think I'm under ten minutes
10 here, I think, what we would do with AB 209 funds, marine
11 geotechnical work is more complex than we initially
12 anticipated, so we could use help with that.

13 Mitigation land purchase, after our meeting
14 yesterday, it's become apparent that we need to purchase
15 some more mitigation land.

16 We'd like to enhance our green port initiative
17 and zero emissions planning. We have planned ground
18 mounted solar. This project site includes what was
19 formerly a paper mill and has large ash landfills, which
20 are perfect for ground mounted solar. Nothing else can
21 really be done with those. We could use help with
22 microgrid planning and implementation.

23 Berth sediment management, management site we
24 could use help with, near-shore restoration, and obviously,
25 we would like to use state funds to match federal funds.

1 So we have a website dedicated just to this
2 project. We also have a YouTube channel with an hour-long
3 YouTube video that goes into much greater detail that you
4 can find there.

5 This is a simulation from years ago from Aker
6 Offshore Winds. We have more new enhanced visual
7 simulations from a lot of different perspectives, ground-
8 based views coming this coming February.

9 And that is what I have for you today.

10 MR. HARLAND: Great. Thank you, Rob. Really
11 appreciate the amount of content you just covered there so
12 quickly.

13 So we're going to move on to the next
14 presentation, so we're going to go from the north coast and
15 we're going to go down to Southern California, actually,
16 it's just to the side of me down here, but really Southern
17 California.

18 So Suzanne, your slides are up and just your name
19 and organization for the record. Thank you.

20 MS. PLEZIA: Thank you, Eli. Suzanne Plezia,
21 Senior Director, Chief Harbor Engineer at the Port of Long
22 Beach.

23 So first I want to start by commending the CEC
24 and the State Lands Commission for the critical work
25 they've been doing on AB 525 Strategic Plan. And thank you

1 for providing me the opportunity to share with you today
2 the Port of Long Beach's plan to support California in
3 developing offshore wind.

4 Next.

5 And, of course, first I want to start off by
6 giving a little bit of background on why offshore wind is
7 important to the Port of Long Beach, and it starts with our
8 commitment to the environment as the green port. We're
9 transitioning our operation to zero emission over the next
10 decade and forecasting a six-fold increase in annual power
11 consumption associated with that.

12 Now, of course, in order to be successful in
13 doing that transition, we are going to need California to
14 be successful in developing offshore wind so there's
15 sufficient, reliable, renewable, resilient energy in the
16 grid as we plug more of our operation into that grid. And
17 of course, the cost of that energy is going to be critical
18 to our business. So facilitating the lowering of --
19 lowering the cost of that offshore wind energy is critical
20 to our strategy.

21 Next.

22 Now, floating offshore wind port requires a lot
23 of land, and this port facilities, they're very expensive
24 to build. So when we build them, we want to make sure that
25 they can facilitate and accommodate future innovation.

1 Next.

2 And that is why we focused in on the 20 to 25
3 megawatt turbine. The larger that turbine, the more
4 efficient, and it achieves economies of scale and
5 increasing the amount of energy we can produce in our wind
6 lease areas using fewer units to operate and maintain. So
7 this means we need less sea space to reach our energy goals
8 with less impact on the marine environment and fishing
9 community while lowering the cost of that energy being
10 produced.

11 Next.

12 Another key focus area for us is on the
13 foundation. It is nascent technology. There's a lot of
14 designs out there right now, and no facility is producing
15 them at the serial production rate we need for our
16 commercial floating offshore wind farms.

17 Now, the NREL estimated that the foundation is
18 around 40 percent of the CAPEX. So the floating foundation
19 represents a huge opportunity to lower the cost of offshore
20 wind energy through innovation and efficiency in both the
21 design and the production.

22 Next.

23 And now I want to focus on why the final assembly
24 and integration sites are the key in a multi-port supply
25 chain network.

1 Next.

2 Now, these sites are used by developers for about
3 two to three years to develop a wind farm. And being in
4 the port world, a two- to three-year lease is an extremely
5 short lease time.

6 Next.

7 This is where the Tier 1 components are delivered
8 by water from those manufacturing ports and staged on the
9 land.

10 Next.

11 Meanwhile, the sub-assembly parts for those
12 foundations are also delivered to the foundation assembly
13 site -- next -- where those pieces are then assembled into
14 the foundation on the land.

15 Next.

16 And then it needs to get from the land into the
17 water, which we're showing the semi-submersible barge
18 strategy that sinks down, and the floating foundation then
19 floats off and is pulled over to the key.

20 Next. Oh, can you go back? Sorry about that.
21 Oh, we're already at the end of my time here. So let me
22 just finish out here.

23 Once they're fully assembled, they're then towed
24 out to the wind farms once the mid ocean and conditions and
25 weather are right. And of course, that production rate

1 that we're seeking at each of those 80-acre staging
2 integration and foundation assembly sites is one of these
3 per week.

4 Now, the reason I focus in on this is because the
5 entire multi-port supply chain network flows through
6 staging integration. And we're going to need sufficient
7 throughput capacity at staging integration to meet those
8 offshore wind energy goals in time.

9 The other key aspect of it is we'll need that
10 sufficient throughput capacity to also unlock manufacturing
11 at the other port facilities in California, like San Diego
12 and our Bay Area ports. Those manufacturing ports are not
13 going to be viable without sufficient staging integration
14 throughput capacity. And that is why the multi-port
15 strategy must first start with establishing the staging
16 integration at Humboldt and the Port of Long Beach.

17 Next slide.

18 So as Matt already went over this, the AB 525
19 Report concluded that those staging integration sites are
20 the most critical element of the multi-port strategy.
21 Humboldt will absolutely play a critical role, which we
22 just heard about, in developing offshore wind. And the
23 Port of Long Beach is absolutely supportive of Humboldt's
24 endeavors.

25 But to achieve California's goal, we'll need

1 additional assembly and integration sites beyond Humboldt.
2 It's infeasible and impractical to construct a new port in
3 the Central Coast to meet that need. So only Pier Wind can
4 provide that need that will complement Humboldt and achieve
5 all of the state's goals.

6 Next slide.

7 And the reason is because the Port of Long Beach
8 has unique qualities that can meet the scale of floating
9 offshore wind. There is no other place on the West Coast
10 that you can cite the size of land that we will need to
11 meet those goals.

12 Next.

13 And being part of the largest industrial port
14 complex in the nation -- next -- it's this area in our
15 outer harbor that's deep, calm water.

16 Next.

17 It's behind a federal breakwater -- next -- and
18 adjacent to one of the deepest and widest federal channels
19 with direct access to the open ocean and no air height
20 restrictions. And it is out of the way of our other
21 operations.

22 Next.

23 We also have a large local workforce -- next --
24 an extensive transportation and supply chain logistics
25 system -- next -- and we have a successful track record of

1 delivering these large marine infrastructure projects.

2 Next slide.

3 The concept we developed is called Pier Wind. It
4 would be the largest purpose-built offshore wind facility
5 in the United States. It is large enough to support that
6 high production rate for both state integration along with
7 the foundation assembly sites, and plenty of area around
8 the facility for wet storage, which is important to
9 disconnect the serial production at the key from the tow-
10 out operation, which is variable. And the longer the tow
11 distance, the more variable and the more important wet
12 storage becomes.

13 And all of these features are designed to help
14 facilitate an efficient operation and achieve those
15 economies of scale that will help lower the cost of that
16 energy. And in keeping with our zero policy, it will be
17 the cleanest, greenest offshore wind terminal in operation.

18 Next slide.

19 Our concept is a gray terminal that can be
20 divided up to meet the most critical need for staging
21 integration and floating foundation assembly, and flexible
22 and adaptable to meet those changing needs over time as
23 innovation and technology advances.

24 Next slide.

25 So when it comes to schedule, time is of the

1 essence, which is reflected in our proposed aggressive
2 delivery schedule. In order to achieve this schedule, we
3 will need the whole of government supporting it.

4 Next.

5 The cost for the entire 400-acre site is
6 estimated at \$4.7 billion in 2023 dollars.

7 Next. And I'll just wrap up on this one.

8 This strategy is much more cost effective when we
9 need that much land to deliver one 400-acre site than five
10 separate 80-acre facilities.

11 Next slide.

12 Now because schedule is important, we have been
13 pushing forward very aggressively at risk so we don't lose
14 this momentum as part of the whole of government that's
15 going to be needed to develop offshore wind.

16 Next.

17 This means we will need to do a lot of activities
18 in parallel to try and compress that schedule as much as
19 possible. And this takes a lot of resources, which we have
20 been onboarding during this interim period while the CEC
21 works through the distribution of this \$45 million grant.
22 We will need a significant portion of those funds in order
23 to continue these activities and maintain our aggressive
24 schedule.

25 I'm going to go over some of the key elements

1 that are underway.

2 Our CEQA NEPA is well underway now. It'll be a
3 joint document with the Port of Long Beach as the CEQA lead
4 and the Army Corps as the NEPA lead. We're continuing to
5 develop the design and perform the technical studies needed
6 for the CEQA NEPA analysis.

7 We've onboarded resources to support a robust
8 community engagement and outreach plan with the community
9 advisory group and a technical expert panel.

10 We've been meeting with our workforce development
11 partners.

12 And the important element I want to focus in on
13 is our Business Finance and Delivery Plan. We've brought
14 on financial consultants to evaluate different business and
15 operating models and those revenue streams, a funding and
16 financing options, and potential project delivery models.
17 And we anticipate completing the draft plan by the end of
18 December.

19 Because these lease terms for the S&I are so
20 short, and those leases don't happen until well into the
21 future, but they can't happen at all unless we build
22 staging and integration, we believe public funding will
23 play a pivotal role in the staging integration sites. But
24 there's a huge return on an investment for both the
25 environment and the economy by enabling offshore wind

1 development and the multi-port supply chain system.

2 And we want to partner with the state on funding
3 and financing solutions that balance out the state's goals
4 and the costs passed on to the ratepayers for this
5 infrastructure. And partner on a federal funding strategy.
6 A key element for the port to be able to leverage that
7 federal funding will be strong support for Pier Wind from
8 the state.

9 Next slide.

10 But if that happens, the benefits of Pier Wind
11 come back to scale. It's the economies of scale of
12 building the largest purpose-built offshore wind facility
13 in the United States that is big enough to build the
14 largest floating offshore wind turbine in the world at an
15 efficient serial production rate to achieve the economies
16 of scale that will accelerate the reduction of greenhouse
17 gases while lowering the cost of that energy and unlock
18 manufacturing to create that industry cluster that will
19 maximize jobs and economic benefits, all of which will
20 position California and the United States to be at the
21 forefront of floating offshore wind development.

22 Next slide.

23 Now the reason I start with our zero policy is
24 because of how offshore wind fits into the vision,
25 supporting the generation of that renewable energy that

1 will feed the grid that connects to our terminal operations
2 and Pier Wind and charging for much of the transportation
3 within our harbor. And as a partner with the state on
4 ARCHES, it will support green hydrogen generation that will
5 help us decarbonize the hardest parts of our transportation
6 sector within the harbor, including the large vessels that
7 call out the port. And our partnership with the state is
8 key for us to be successful together in transitioning to
9 green energy and a green economy.

10 Next slide.

11 So in summary, Pier Wind, we believe, is a
12 critical piece and a larger puzzle that will need to come
13 together in a wholistic strategy for offshore wind to be
14 successful. Pier Wind is designed as a system solution
15 that enables a multi-port strategy. Manufacturing is not
16 viable without it, and it can't be done anywhere else.

17 Time is of the essence. California needs to be
18 bold and decisive and send a strong signal of support for
19 Pier Wind with significant portion of the grant funding.
20 And together, we will achieve environment, energy,
21 economic, and equity goals.

22 Next.

23 Thank you for the opportunity to present today.

24 MR. HARLAND: Thank you for the presentation.

25 And I see why you were hoping to be able to run it

1 yourself, but I thought that between your next and Hilarie
2 Anderson, who's running the slides, you guys are really in
3 sync there, so, yeah. But thank you so much for making the
4 trip and the presentation.

5 We're going to transition now to Zoom for our
6 next panelist.

7 Mike, it's going to pass it over to you if you
8 can just state your name and organization for the court
9 reporter?

10 MR. DIBERNARDO: Yes.

11 MR. HARLAND: And you should be on.

12 MR. DIBERNARDO: This is Mike DiBernardo, Deputy
13 Executive Director here at the Port of Los Angeles. And a
14 great presentation by Rob and Suzanne. Definitely well
15 ahead of some of the things that we're doing, but really
16 appreciate the opportunity to speak to this group.

17 So if I could share my screen real quick, I would
18 appreciate it.

19 MS. ANDERSON: You should be able to go ahead and
20 do that.

21 MR. DIBERNARDO: Let's see. One second. Having
22 a little bit of a -- okay. There we go.

23 So obviously, I don't have an elaborate
24 presentation, such as my colleagues at the other ports.
25 But what I'd like to share with you, and hopefully you guys

1 can see my screen very well there, but at the Port of Los
2 Angeles, we definitely are interested in getting involved
3 in wind turbine production and recognizing that what Matt
4 said in his presentation, that the key ports are the Port
5 of Long Beach, Port of LA, and Humboldt Bay, we can look at
6 some opportunities here and obviously use grant funding to
7 help us with some of these studies.

8 We have two potential sites that are probably
9 ideal for staging and integration, as well as some
10 manufacturing. We have a former Southwest Marine, which is
11 a former shipyard. It's approximately 27 acres. We would
12 have to do a little landfill there that you can see on the
13 south side of that dot that would fill in those spots to
14 get 27 acres. And we estimate that cost to be about \$350
15 million, where about 36 feet of water depth there with 1100
16 linear foot wharf. So that would be a potential site that
17 could be used for, again, staging and integration and some
18 manufacturing.

19 The other facility that's a possibility is right
20 next to what Port of Long Beach was saying with their Pier
21 Wind project, which would be a pure 500 landfill. We
22 estimate that about 160 acres. Currently the land that's
23 there is about 15 feet below water. So it doesn't have all
24 the environmental credits to come out of water but it
25 could, securing enough credits to do that. And that's

1 estimated to be about \$2.1 billion. That was going to
2 be -- about ten years ago we did a study for a potential
3 container terminal there. So it would have been the
4 size -- the wharf length would have been sized to handle
5 two of the largest container vessels, so probably over 2000
6 linear feet of wharf, maybe even longer.

7 But these are the two sites that we can
8 potentially consider for this grant. And, definitely, we
9 would consider using this grant money to do further studies
10 on these two sites.

11 So that's all I really have at this point, not as
12 elaborate as Rob's presentation, which I thought was very
13 impressive, as well as Suzanne's. But this is what the
14 Port of Los Angeles could discuss further, and we
15 appreciate the opportunity.

16 Thank you.

17 MR. HARLAND: Great. Thank you so much, Mike,
18 for being here. And if you're able to hold on for a little
19 while, I know that you have a constraint, but that would be
20 great to have you have you on, so appreciate it.

21 MR. DIBERNARDO: Thank you. I'll stay until
22 3:00, and then we have a colleague that's still on, and
23 then I'll come back after my three o'clock meeting. Thank
24 you.

25 MR. HARLAND: Okay. Great. All right.

1 So now we're going to move back up north, I
2 guess. So our next panelist is Simon from the Port of San
3 Francisco, Simon, your name, organization. And I think you
4 saw the drill there, but just letting Hilarie know when you
5 go next.

6 MR. BETSALEL: Hello, my name is Simon Betsalel.
7 I'm Capital Projects manager with the Port of San
8 Francisco. Thank you for having us join you today.
9 Exciting to hear about all the other ports activity and the
10 ambitious projects we have online.

11 Next slide, please.

12 So first, a little bit broadly about the Port of
13 San Francisco. We're a little different than the other
14 ports in the state in that we're sort of more of a linear
15 jurisdiction versus a concentrated industrial port. Like
16 Rob mentioned with the Port of Humboldt, industrial
17 activity at our port really peaked in the '50s and '60s.
18 Now we're a mix of commercial fishing in the north, as well
19 as tourism, running through commercial, residential,
20 recreational, down to the southern waterfront where our
21 legacy industry still resides, adjacent to a number of
22 historically underserved populations, Hunters Point and
23 Bayview.

24 So next slide, please.

25 So San Francisco has a few opportunities, I

1 think, to contribute to offshore wind. Unfortunately,
2 because of the bridge heights of the Bay Bridge and the
3 Golden Gate Bridge, we're limited to manufacturing, as well
4 as operations and maintenance, but have a few facilities
5 that could help these efforts.

6 So Pier 70 is a former shipyard. Pier 80 is our
7 current break bulk terminal. And Pier 94 and 96 and the
8 upland area are where we have concentrated our effort to
9 date, and I can explain that in just a second.

10 Next slide, please.

11 But first, Pier 70 and Pier 80. Pier 70 on the
12 left could be used for operations and maintenance, as well
13 as administrative offices. This site specifically is the
14 most integrated into San Francisco, adjacent to a lot of
15 restaurants, apartments, and kind of potentially very good
16 asset for workforce. Pier 80, currently used for importing
17 and exporting of vehicles, could be used for offloading
18 large offshore wind components and indoor-outdoor storage.

19 Next slide.

20 And then Pier 94 and 96, this is where we've had
21 work to date. We envision this as being a contiguous,
22 nearly 100-acre site dedicated specifically to offshore
23 wind. It's in usable condition now, but we have some
24 planned upgrades that we've begun working on. This is also
25 designated as a FEMA emergency site for the Bay Area, so

1 we're leveraging some hazard mitigation grants from FEMA to
2 begin our design work here. But envisioning a five-acre,
3 6,000 pounds per square foot wharf, nearly 1,500 feet long,
4 and then a 90-acre upland area with soils improved to 3,000
5 pounds per square foot.

6 Something unique about the wharf is that it's
7 hopefully expedited. We don't need to fill any land. It's
8 already zoned and approved for industrial usage. And the
9 wharf has an existing deepwater depth and is adjacent to
10 the San Francisco Bay that could be used for sinking
11 foundations and preparing these components. And it's also
12 closely located to highway, as well as an intermodal rail
13 storage yard just to the left of this green upland area.

14 And then this site, specifically Pier 9496, is
15 part of our Eco-Industrial Maritime District, where we
16 tried to co-locate industrial activities so they can
17 complement each other.

18 Just to the north of this site is a concrete
19 batch plant and aggregate importer. They supply the
20 majority of the construction materials for San Francisco's
21 concrete buildings and could easily help support creating
22 floating foundations depending on technologies that were
23 chosen.

24 Next slide.

25 So currently, we have just completed a concept

1 report outlaying a potential schedule and investments
2 needed. We're preparing an RFP for design, so AB 209 could
3 help fund that design work as we advance our proposal and
4 start permitting. We're taking this presentation and our
5 intentions to the Port Commission, our governing body, in
6 two weeks. And our Maritime and Legislative Affairs staff
7 are continuing to engage with grant agencies as well as
8 private developers.

9 The image on the right here is what we envision
10 the site looking like. We will be, the Port of San
11 Francisco will be undertaking the below-ground
12 improvements, so that's the wharf strengthening, the soil
13 improvements, and utility upgrades. It would be on a
14 developer or operation partner to really come in and build
15 these fabrication facilities.

16 That's our vision to date. We're excited to
17 continue these conversations and to be a part of AB 209 and
18 figure out how we can get these things funded.

19 Thank you.

20 MR. HARLAND: Great. Thank you much, so much,
21 Simon. And if those board meetings, if those are
22 broadcasted online, if you remember, if you could send me a
23 link, I'd love to listen in.

24 And so, okay, so now we'll move back down south
25 and go to San Diego. David, I don't know if it's going to

1 be you or Thomas that have the most miles traveled today.
2 Rob, you were probably going to be close, but then Crescent
3 City showed up.

4 But David, name, organization, and then take the
5 mic.

6 MR. YOW: Great. Thank you, Eli. David Yow,
7 Port of San Diego, Legislative Policy Administrator. No
8 slides today. That's my ploy to bring you all to San Diego
9 and check it out in person. Thank you, especially to Eli
10 and all the CEC staff, State Lands partnership, and of
11 course, the leaders at both agencies that have been so very
12 supportive in getting us to this point.

13 A quick introduction, if you haven't yet been to
14 San Diego, there are a few of us out there, it's the
15 southernmost of the ports here at the dais today. There's
16 five member cities that are within the jurisdiction of the
17 port. It's not only San Diego, because that's in the name,
18 but there's National City and Chula Vista, Imperial Beach,
19 Coronado, and that comprises 34 miles of waterfront.

20 There's a \$9.2 billion economic impact that we
21 deliver, and the way we do it, it's maybe a little
22 different than some of the other ports. What you've seen
23 at virtually all the ports may look similar, and yet
24 underneath the surface, you have different aspects. Some
25 of the aspects you'll find in San Diego go beyond

1 traditional maritime. There's recreational visitor-serving
2 activities and many parks and natural spaces as well. But,
3 of course, for our answering the call to duty for
4 supporting the offshore wind industry, that's going to
5 enlist our maritime terminals. We have two cargo
6 terminals, and with them, the space and the workforce, and
7 I'm going to hit on those two points probably the most
8 today.

9 We'll start with the space that we have. The
10 Tenth Avenue Marine Terminal has approximately 96 acres,
11 and the kind of work that they do is handling cargo that
12 doesn't fit in a box. It's high, wide, and heavy, and it's
13 cargo that's large enough that it requires substantial
14 laydown space. And so, in fact, to that end, we've
15 obtained federal grant money to knock down some of our
16 antiquated warehouse sheds that aren't as necessary as the
17 acreage that we need right there where the ships dock.

18 A little bit south of there is the National City
19 Marine Terminal, and that's 135 acres. They handle, also,
20 non-containerized cargo. It's assorted ro-ro cargo of
21 various types that, again, need space, whether it's
22 military helicopters, or obviously automobiles, one out of
23 every ten cars on the road comes through there, the Hawaii
24 service that connects to the mainland, it's anything that,
25 again, doesn't fit in a box, and that answers the mail on

1 offshore wind.

2 The second thing that I mentioned, along with
3 space, is workforce. This is another uniqueness, I think,
4 in San Diego, is the fact that on our working waterfront,
5 the area that is between our two cargo terminals, along
6 with the substantial Navy presence, are six shipyards,
7 including General Dynamics NASSCO, which employs something
8 on the magnitude of 3,500 employees. There's 700
9 steelworkers there. This industry could bring in another
10 2,000 of them, and they are the largest full-service
11 shipbuilder on the West Coast today, doing tons, literally
12 60,000 tons of hot work every year in steel processing.

13 The other thing that I think goes with the
14 workforce is the access to the heavy-lift crane system.
15 Port of San Diego has successfully obtained the first all-
16 electric mobile hardware crane system in North America, and
17 it was made for us in Germany. It just arrived, and it
18 will be Commissioned later this year. It will have a 400-
19 metric-ton heavy-lift capacity, which is the heaviest on
20 the West Coast, unless you go up to Vancouver or bring in
21 your products from the Gulf, so that's quite a ways away.

22 Looking at the opportunity in front of us, and
23 thinking of Eli's categories, Categories 1 and 2 are going
24 to be, I think, the most interesting to us at the outset
25 because of the initial tools that we need to eventually get

1 to the point where some of our other sister ports are
2 today. One is that business plan. That's going to help us
3 explore the options that we have without disrupting
4 existing business and honoring the commitments we've made
5 with our other economic partners there and look at how to
6 allocate the space and the operations. That's one.

7 Two is an engineering design study to help us
8 develop the area to maximize what we estimate to be 30 to
9 40 acres that could be utilized. And here's, I think, even
10 bigger than offshore wind, if it's possible to say it like
11 that, is all the multiple co-benefits that you see when the
12 state makes that sort of investment to move ports in this
13 direction.

14 Because it's not just going to be offshore wind
15 that benefits. As huge an undertaking as that's going to
16 be, you have existing maritime -- or I'm sorry -- maritime
17 activities that can be enhanced through greater efficiency
18 of goods movement, being able to, within our existing
19 footprint, reconfigure operations so that we can actually
20 do more with the same amount of space, and that's going
21 from our supply chain prices to where we are today. I
22 think we've seen the benefits of doing things like that.

23 We're are also a commercial strategic seaport,
24 and that's a designation I didn't touch on earlier but
25 maybe I should have started with that because that

1 underscores the special relationship that ports like San
2 Diego and 17 other strategic seaports in our country have
3 with not only the U.S. military, in our case the Navy and
4 the Army, but also those shipyards that, again, provide the
5 ship repair and maintenance for the Navy. And because of
6 that role that they already have with their workforce, with
7 their facilities, with their skills, all the trades already
8 in the San Diego area, they're able to springboard off of
9 that to supporting a new industry.

10 And I'll add a third, which is emissions
11 reductions. You have a port that's already electrifying,
12 it's decarbonizing its operations and doing so now with,
13 you know, I'll go back to that crane and say that this is
14 the sort of investment that allows us to maximize the right
15 kind of infrastructure, the right kind of equipment that
16 has improved benefits for our portside communities.

17 So there are many strategic advantages, as well
18 as the one that's in front of us today, for the workforce,
19 for the trades in California, and we look forward to
20 strengthening the partnership with CEC.

21 Thank you.

22 MR. HARLAND: Great. Thanks, David, for walking
23 us through that, appreciate it. And also thank you for
24 being on the panel today.

25 We're going to go back to Zoom for the next two

1 presenters. We're going to first have the Port of Hueneme,
2 and then after that on Zoom is going to be the Crescent
3 City Harbor District, and then we'll finish in the room
4 with Jason from Port of Oakland.

5 So I'm going to pass it over to -- do we have
6 Port of Hueneme on? I think Miguel's on today.

7 MR. RODRIGUEZ: Yes, I'm on. Thank you. Miguel
8 Rodriguez. I'm the Community Relations Director here at
9 the Port of Hueneme. And I'm happy to be here
10 participating. I think that this is a great opportunity.

11 Obviously, for us at the Port of Hueneme, we are
12 in a very strategic location, very close to Morro Bay.
13 Unfortunately, we are not necessarily the most spacious
14 port in California. Our entire port is literally about 120
15 acres which, you know, is a testament to our efficiency,
16 right, because we were able to move over \$14 billion in
17 cargo value, as well as we're the number four California
18 container port, and we're in the top ten percent of U.S.
19 ports. And that, you know, places a very heavy
20 responsibility on us, primarily as a job creator in the
21 region, right, for creating opportunities for folks, and
22 also for business and trade to occur in our Central Coast
23 area.

24 Because we are very limited with our land space,
25 our customers and our business partners have had to create

1 opportunities through acquiring land off port. And this
2 not only has cemented a lot of our partners off port, but
3 also has taken a lot of the real estate. And we're also
4 surrounded by a lot of agriculture, which further limits a
5 lot of our capacity, right, for some of these larger
6 operations. We do have about 40-foot berths, right, that
7 are available. However, also the entrance to our channel
8 is not very wide, right, it's about 300 feet, so that makes
9 it a little bit difficult for a lot of these great
10 operations.

11 However, based on the studies and the Strategic
12 Plan, we would be very interested in participating in port
13 infrastructure and workforce development. We do have a lot
14 of capacity, right, to help some of these vessels that are
15 going to be doing some of these supply missions or crew
16 changes, or even doing some of these inspections out and
17 about, and also creating something related to a training
18 center that's near where the focus area is near Morro Bay.
19 And this would also help us create more jobs and help some
20 of the folks that are in our region right into the middle
21 class through some of these new improvements in technology.

22 So ideally, we would see ourselves collaborating
23 for funding, for development of whatever it is that we need
24 to, you know, be a part of with other sister ports. I do
25 believe that our bigger sister ports do have a lot of the

1 advantage for having more land available. But for us at
2 Hueneme, I think that the more strategic play in this
3 effort is to be a part of the operations and maintenance.

4 So with that, that's the end of my comment.
5 Thank you.

6 MR. HARLAND: All right. Thank you for joining
7 us today, Miguel, and hopefully you're able to hang on for
8 a bit while the panel still goes.

9 So we're going to stay with Zoom participants.
10 Next we have Mike from Crescent City Harbor District who's
11 going to be presenting remotely, and then Thomas from
12 Crescent City is here in person.

13 So, Mike, it's you and then we have one more
14 presentation after and we've added all your slides to the
15 deck. Hopefully all of those look the same as when you
16 sent them to us. We did our best to integrate them. So
17 I'll pass it over to you, name and organization before you
18 start. Thank you.

19 MR. RADEMAKER: Okay, sure. I'm Mike Rademaker.
20 I'm the Assistant Harbormaster for the Crescent City Harbor
21 District. And as you mentioned, my co-presenter, Thomas
22 Zickgraf, he's our Comptroller, he'll jump in as needed to
23 provide any additional context.

24 So first off, thank you for this opportunity to
25 introduce our small harbor to those who may not be familiar

1 with our capabilities and our exciting potential. Just to
2 provide some perspective, we're right up against the Oregon
3 border in the northernmost section of the north coast. So
4 our Harbor District is approximately 6,000 acres. So we're
5 modest in size, but I'd say we are very large in terms of
6 our enthusiasm for wind power.

7 Okay, next slide.

8 So our local economy, it's gone through several
9 phases. Initially, we were part of the California Gold
10 Rush in the 1800s, then dominated by the timber and fishing
11 industries. And more recently, tourism has been
12 significant, especially after the establishment of Redwood
13 National Park in 1968, which is adjacent to our harbor
14 district. And we're very excited about offshore wind power
15 revitalizing our local economy. And we appreciate its
16 significance in the statewide, national, and global energy
17 priorities.

18 Okay, next slide.

19 So our leadership team has a strong maritime
20 background, naturally, especially our Harbormaster, Tim
21 Petrick. And he's complemented by other members of our
22 team with engineering experience. Myself, personally, I've
23 been focusing on energy engineering more recently. And our
24 Comptroller, Thomas Zickgraf, has decades of experience in
25 finance and business development. So we know how to use

1 funds responsibly and prudently. And our Grant Manager,
2 Mike Barr (phonetic), brings decades of experience managing
3 clean energy projects. And we're all very enthusiastic
4 about the future prospects of wind power.

5 Next slide.

6 And we're very proud about our success in
7 obtaining grants that are laying the foundation for
8 offshore wind development based out of our harbor.

9 Next slide.

10 So this includes the construction of a new
11 seawall with some new and modern hoists.

12 Next slide.

13 We're also preparing to construct a new dock that
14 will be capable of supporting a minimum of 500 pounds per
15 square foot up to several thousand pounds per square foot,
16 which is well-designed, obviously, for offshore wind O&M
17 activities.

18 Next slide.

19 And these are just some further examples of
20 recent grants that we've received just to kind of give you
21 an indication of what we're up to.

22 Next slide. And next. And next one.

23 Okay, so looking forward to the future.

24 Next slide.

25 So we want to bring attention to the fact that

1 off the Del Norte County coast, we have some of the best
2 wind resources of the entire Pacific coast, with average
3 wind speeds up to 12 meters per second.

4 If you can see that white star there on the map
5 near the California-Oregon border, that indicates the
6 location of the Crescent City Harbor District. So we are
7 really strategically located, approximately 30 miles north
8 of the Humboldt call area and 30 miles south of the
9 Brookings-Oregon call area. And BOEM has indicated that an
10 even closer Del Norte County call area is imminent.

11 Okay. Next slide.

12 So this next slide illustrates the suitability of
13 our Harbor District to serve as an operations and
14 maintenance port. We have 25 feet of depth in the main
15 channels, which could potentially be deepened to 30 feet in
16 many areas. We're approximately 6,000 acres, and we have
17 abundant potential wet storage areas.

18 Next slide.

19 So these are examples of some of the vessels that
20 could comfortably work out of our harbor. So we're capable
21 for turbine construction vessels, but we're very capable of
22 hosting operations and maintenance vessels, which includes
23 all the vessels shown here, up to several hundred feet in
24 length.

25 Okay. Next slide.

1 So these next slides just provide some additional
2 context by illustrating future projects in our harbor.

3 Next slide. And next.

4 So we are really embracing wind energy. As I
5 mentioned, we're strategically located, and we've been
6 engaging with Moffatt & Nichol and some other engineering
7 firms to validate the suitability of our harbor for wind
8 power operations and maintenance. And we have a number of
9 infrastructure upgrades in progress, as illustrated by some
10 of those grant funding opportunities that we've taken
11 advantage of.

12 Additionally, I think it's worth mentioning that
13 we have a diverse community. So we're home to independent
14 commercial fishermen. We engage with our tribal partners
15 on a regular basis. And we have some underrepresented
16 groups that are perfectly aligned with the state's
17 inclusivity goals.

18 Next slide.

19 So really, the focus of today's meeting, how the
20 Energy Commission could help us and other smaller harbors.
21 We really appreciate those Category 3 funding opportunities
22 to provide matching funds. You know, given our size, a
23 small harbor can definitely be a challenge to get the match
24 requirements necessary for some of these huge
25 infrastructure projects that will be required for offshore

1 wind.

2 We're also really keen on anything that can be
3 done to streamline their regulatory approvals. And we
4 could certainly appreciate some technical assistance with
5 permitting, project management.

6 And we really want to promote collaboration among
7 large and small California parks and harbors down the
8 coast.

9 Next slide.

10 And another challenge, particularly in our area,
11 there seems to be a lot of myths in the community about
12 wind power and its impacts to the fisheries and coastal
13 communities. We see it really as a net positive. But this
14 has been challenging. There's been some opposition,
15 especially in southern Oregon. And we're doing our best
16 really to present an objective picture. Some of these
17 offshore wind power platforms have provided, you know,
18 areas for fish to flourish, and it's not necessarily
19 negative.

20 We also really want to promote the economic
21 development of underserved and economically distressed
22 communities through offshore wind power. We think there's
23 some real potential there.

24 Next slide.

25 That's the end of my presentation. So thank you

1 very much for the opportunity to present today. We're
2 extremely excited about future prospects for offshore wind.
3 And we appreciate the support provided by the California
4 Energy Commission.

5 MR. HARLAND: Thanks a lot. Did you want to add
6 anything to the presentation?

7 MR. ZICKGRAF: So one thing I would just stress
8 is really the need for the match funding. It would
9 probably be the most beneficial for smaller harbors and, I
10 think, for all of us. It's really to be able to leverage
11 match funding, and then also being able to look at how can
12 we prioritize harbors and ports that have started the work.

13 You know, one of the things that comes to my mind
14 is what type of demonstration projects could we roll out
15 first so that we have the chance in some ways to learn from
16 those that have started before us? You know, one of the
17 things that I've learned by working with startups is that
18 oftentimes what I've learned is from what went wrong as
19 much as what has succeeded. So allowing some rollouts for
20 demonstrations so that we can learn. So how quickly can we
21 roll out projects and then adapt might be helpful. But the
22 most significant would be match funding.

23 And then, also, ports and harbors, from someone
24 that's sort of new to the industry, I've been with Crescent
25 City for about a year and a half, and the one thing that

1 has really struck me is that ports and harbors have a
2 really strong network amongst themselves for working
3 together, for sharing resources.

4 And the one thing I would really encourage the
5 Commission to do is to really find ways in setting up the
6 grant programs to make sure that we're setting up the
7 system so that we're complementing each other and not so
8 much as competing against each other. Because as we're
9 looking at building this very vast, complex new industry,
10 it's going to take all of us.

11 And there's such opportunity out there that we
12 really need to be sharing resources and working together as
13 regions statewide and not necessarily competing against
14 each other would be the sort of -- my two big asks are
15 federal -- being able to use state grant funds for federal
16 match, and then also setting up ways for increasing
17 collaboration, for sharing resources and being able to
18 strengthen the work and the networks that are already in
19 place.

20 But thank you very much. And I'm really
21 impressed with the processes that have been set up and
22 being able to work with your team.

23 MR. HARLAND: Thank you for making the trip here
24 to support the presentation.

25 Also, can you do your first and last name real

1 fast for the court reporter?

2 MR. ZICKGRAF: Sure. I'm Thomas Zickgraf.

3 MR. HARLAND: Perfect. Thank you so much.

4 Also, not just the windiest place up there, but
5 the coldest ocean I've ever jumped in. So bring a wetsuit
6 if you're ever going to swim up there.

7 All right, so we'll move on to the last
8 presentation. And I just want to note, too, I should have
9 done this at the beginning for our panelists, but our panel
10 almost outnumbered the amount of people that we have in-
11 person in the audience. I think that's because it's a
12 Friday, so it's hard to bring people here. At one point,
13 we had over 150 people on Zoom. So there's a lot of people
14 listening and paying attention. So just wanted to make
15 sure you knew that.

16 So pass it over to you, Jason, name and
17 organization.

18 MR. GARBEN: Great. Thank you. I'm Jason
19 Garben. I'm with the Port of Oakland. I manage our
20 Project Management Division. Thanks Eli for having me.
21 Appreciate the opportunity to be here to speak to kind of
22 our interests from the Port of Oakland's perspective.

23 The Port of Oakland is primarily a container port
24 serving the Northern California region. I have one slide,
25 I think.

1 MR. HARLAND: Yeah, you have a map; right?

2 MR. GARBEN: I think I have a map.

3 MR. HARLAND: Yeah.

4 MR. GARBEN: I don't see it up there yet. But we
5 have about 1,300 acres of maritime-related facilities that,
6 you know, are either marine terminals, container terminals,
7 or ancillary services that support those marine terminals.

8 I feel like we're a little late to the wind
9 party, but we're kind of reengaging and finding that we may
10 definitely have some interest in supporting and figuring
11 out how we fit into this industry on the West Coast.

12 We've been, you know, in negotiating a deal for a
13 major league ballpark on the Howard Terminal, which is
14 highlighted on the map there toward the bottom and with the
15 black outline. And I think that we've kind of determined
16 that, you know, with our transition to zero emissions, you
17 know, operations, what better way to support, you know, the
18 need for additional power through this offshore wind
19 industry.

20 So we are re-evaluating the Howard Terminal
21 location. It's about a 50 acre site. It's got about 2,000
22 linear feet of berth frontage. And the depth of the water
23 there is about 42 feet.

24 I think that, you know, from our perspective, you
25 know, we're very early on in determining what we would

1 need, but some of the Category 1 and 2 funding that you
2 explained earlier would be of interest. And you know, I
3 think that we'd be very interested in preliminary
4 engineering and workforce development for our local
5 community.

6 So, you know, I'm here today to learn, and we're
7 also very interested in monitoring this as we move forward.
8 I just wanted to kind of keep my comments brief and again,
9 appreciate the opportunity to be here.

10 MR. HARLAND: Great. Thank you so much for being
11 here, as well, making the trip and participating.

12 So we're real close to being able to, I think,
13 break the panel. But before I did, I wanted to see if
14 Chair Hochschild or Commissioner Monahan, if you had any
15 questions for the panelists or any clarifications before we
16 let everyone go? I wanted to open it up to you.

17 COMMISSIONER MONAHAN: Well, I just want to say
18 quickly that I really appreciate all the ports engaging on
19 this. And what's really heartening is to see that, you
20 know, no matter what level of engagement you've had so far
21 that all the ports, I think, have an interest in engaging
22 or learning more about the role they can play. You know,
23 great to hear the port of Long Beach, of course, and
24 Humboldt already kind of leading the way in terms of
25 staging and integration, but there's lots to be done for

1 sure. So exciting to move forward and thanks to everyone
2 for participating.

3 CHAIR HOCHSCHILD: I just wanted to chime in and
4 give my thanks as well. That was a really, really terrific
5 sort of tour through all of the opportunities. And I
6 appreciate all the preparation and look forward to the
7 continued engagement with everyone as we move forward.
8 Thanks everyone.

9 MR. HARLAND: Great. Thanks a lot.

10 And I just want to say thank you, as well, to the
11 panel. I don't know if you had any questions or any
12 comments?

13 MS. ANDERSON: No.

14 MR. HARLAND: No?

15 MS. ANDERSON: Just want to echo my gratitude as
16 well. Thank you.

17 MR. HARLAND: Yeah. Yeah, we appreciate it.
18 I'll be looking forward to any written comments, or also
19 there's a public comment opportunity at the end of this
20 that you're welcome to participate in, especially reactions
21 to my presentation earlier.

22 We're going to break for five minutes. So if you
23 can be back at 3:18, we have our last panel today, and then
24 following that will be public comments. So we'll see
25 everybody in five minutes. Thank you.

1 (Off the record at 3:13 p.m.)

2 (On the record at 3:22 p.m.)

3

4 MR. HARLAND: All right, we're going to get
5 started on our second panel.

6 Hilarie, do we have you there?

7 MS. ANDERSON: Yep, I'm here.

8 MR. HARLAND: Fantastic. Perfect, so let
9 everybody get regrouped. Okay. Welcome back everyone.
10 Appreciate everybody hanging in there for our second panel.

11 So the first panel we just ran through, the
12 purpose of that panel, hopefully everybody could tell, was
13 to bring in ports and harbors into a conversation. And we
14 kind of thought of that as the -- almost kind of the public
15 sector panel behind this. And so I think we heard a lot
16 about engineering and sort of design concepts.

17 We also wanted to bring in a private sector
18 perspective into this panel. We obviously are investors
19 ourselves in some way with our grant program. So we wanted
20 to make sure that we understood through this process the
21 full sort of investment cycle that will have to happen to
22 improve offshore wind -- or approve ports for offshore
23 wind.

24 So this panel, we're going to have a presentation
25 first by Brian. And then we're going to move in and hear

1 remarks from Sean and Sloane and Molly. We do have Sean
2 online. So, when we get there, Sean, you'll be ready to
3 make your remarks. And following this panel, we'll do
4 public comment. And after that, we'll go to wrap up and go
5 home.

6 So, Brian, I will pass it over to you. Again,
7 name, organization. And Hilarie, who's awesome running
8 this Zoom, as well as moving these slides along, just let
9 her know when you need to go next.

10 MR. SABINA: That sounds great. Thanks so much,
11 Eli, for the warm introduction. My name is Brian Sabina.
12 I'm the CEO of Clean Energy Terminals. We are a
13 California-based project developer that's focused on
14 building out port infrastructure. We have been engaging
15 over the last seven or eight months with a number of the
16 ports that are here in the state and hope to be bringing
17 our first project, announcing our first project and moving
18 it to market in the next, we'll call it four to six months
19 or so.

20 Thank you to, of course, Chair Hochschild,
21 Executive Lucchesi, Commissioner Monahan, Eli, your whole
22 team at the CEC. We think you guys are doing a great job
23 pushing this forward. And California has really taken a
24 great leadership role in thinking through ports and
25 infrastructure needed for offshore wind in a comprehensive

1 and thoughtful way. I would actually argue that what's
2 been done here in California is probably nation leading,
3 given what we've seen across the country and how you've
4 taken a really purposeful approach to this.

5 Prior to launching Clean Energy Terminals, I had
6 the pleasure of sitting in a seat very similar to what Rob
7 or Suzanne sat in. I was the Chief Economic Growth Officer
8 for the State of New Jersey at the New Jersey Economic
9 Development Authority. I led a large portfolio of
10 financing programs, including offshore wind-specific
11 programs, a little bit similar to some of the grant
12 programs that we're talking about today. I led strategic
13 sector support for the state, which we engage a lot with
14 offshore wind companies.

15 And I also led a real estate and infrastructure
16 development team and, through that role, led a number of
17 port projects for the state, but specifically helped
18 negotiate the deal for EEW, a monopole manufacturer, to
19 come into the port of Paulsboro. Very excited to see the
20 port of Paulsboro get a PIDP grant today to support their
21 project again.

22 But probably most relevant to this conversation
23 is we led the development of the New Jersey wind port, a
24 billion-plus dollar co-located marshland plus manufacturing
25 port, and took that from, you know, cocktail napkin through

1 now construction, and we looked to open up for phase one
2 operations next year, mid-year. A project that's very
3 similar to what Rob and the team at Humboldt are doing, but
4 for a fixed bottom project as opposed to floating.

5 One of the great things that we had the
6 opportunity to do over the course of the last five years of
7 working on offshore wind on the East Coast and now coming
8 here to California was work with what was then known as the
9 Business Network for Offshore Wind, now known as the
10 Oceantic Network, as part of a ports working group. It's a
11 group of 20-plus private sector companies, ports,
12 engineering companies who are all committed to really
13 thinking through how do we accelerate port development for
14 offshore wind and all the economic benefits that happen
15 from that here in the United States.

16 One of the things we've done, really inspired
17 about what's happened here in California, was to say
18 California has really thought deeply about what is the true
19 cost of port infrastructure development going to be? What
20 does the true scale of development need to be in a very
21 thoughtful way? And we said that same approach needs to be
22 taken across the whole country.

23 So we put together a number of resources to
24 launch this report you see on the screen, building a
25 national network of offshore wind ports. It's a \$36

1 billion plan for domestic clean energy infrastructure
2 that's talking about all the different types of offshore
3 wind ports across the East Coast, West Coast, and the Gulf
4 Coast.

5 Our focus was a little bit different. It's a
6 little bit less technical, a little bit more about how do
7 we chart a financial pathway in an engagement pathway to
8 get there?

9 So we really wanted to think about, one, let's
10 scope the problem appropriately in that in the report for
11 not just the West Coast but the whole country. Let's make
12 sure we understand what's happened on the East Coast so far
13 and let's make sure we're learning from that as we move
14 forward.

15 And then we've talked about how do we bring
16 together some real thinking about when money is needed and
17 what are some solutions that can be brought to the table so
18 that both public sector money comes into this as well as
19 really private sector money.

20 When we talk about the scale of funding that's
21 required to get into offshore wind infrastructure, we
22 really believe that it's important for both the public
23 sector to be investing, but also to find ways to enable the
24 private sector to invest as well. Whether you're talking
25 about \$11 billion to \$2 billion or \$36 billion, either

1 way, that's more money than probably most of us have in our
2 pockets, and sharing that burden is probably pretty
3 important. And we think that that should be a cornerstone
4 of how California continues its nuanced and thoughtful
5 approach towards infrastructure development moving forward.

6 Just a tiny, one more second on just context of
7 the report that we wrote, part of the working group. When
8 you talk about what are we building towards, what are the
9 goals, obviously every state has different goals. We
10 anchored this report and what we need to get to 30 gigs by
11 2030. But really if you're in the port development
12 business you probably know that if you don't have a project
13 that is in hardcore development today, you're probably not
14 on track to support the 30 gigawatts by 2030.

15 And what we should really start thinking about
16 given the length of the asset classes, you know, the
17 lifespan of the asset classes that we're building is we
18 should be thinking about our long-term national goals, 110
19 gigs by 2050 at a national level, and that really meshes
20 well with what we see with how California is thinking about
21 20 gigs by 2045.

22 You can go to the next slide.

23 This is a bit of an eye chart for those of us who
24 are sitting in the table but hopefully those who are at
25 home can read this a little bit better. But we did a

1 bottom-up analysis of how many ports are actually needed
2 across all the different port types. We roughly share a
3 similar methodology to what's been done in the AB 525
4 report. We said how many ports do we actually need across
5 manufacturing, across O&M, across staging integration,
6 marshalling, how many are in commercial operations today,
7 how many are in construction today/in development, and what
8 can we learn from that?

9 Our big takeaway is when we do this bottom-up
10 analysis is that the country needs somewhere in the range
11 of, you know, 99 to 119 different port sites. And the way
12 that Matt framed it earlier of kind of thinking about a
13 site where there can be multiple sites within the context
14 of a given port is really important. And when we look at
15 how many of those sites are in development today, we see
16 around 35, maybe we could add a few more of those, but
17 somewhere in the range of, you know, 35 to 40 sites are in
18 development today.

19 So there's a huge offshore wind infrastructure
20 gap across the country. California and the West Coast are
21 part of that but we also need to put that in the context of
22 the Gulf Coast and what's also needed on the East Coast,
23 especially for manufacturing over the long term.

24 And we put this picture up there to say that what
25 California is thinking through right now is part of a

1 national story of funding that's needed. It's not just
2 California's burden to bear and that we should be thinking
3 about state programs but also, as Suzanne said,
4 collectively lobbying for the right sort of federal
5 solutions as part of how we move forward.

6 We also looked a lot and engaged a lot with the
7 ports that were in development today. And I should mention
8 that a couple of the members who are on this panel today
9 were peer reviewers of this report, including Sloane and
10 Sean, a number of the companies that Molly represents.

11 And when we talked with a lot of companies what
12 we found is those products that are in development on the
13 East Coast right now are actually facing pretty significant
14 financial stresses. And that's not just due to the fact
15 that it's a major wind and nascent industry. There hasn't
16 been enough committed state funding and committed federal
17 funding to come in to really support these projects at the
18 pace that we need to develop to achieve our goals. Most
19 projects face somewhere between, I'm trying to read my
20 numbers here, between \$50 million to \$150 million dollar
21 funding gap in their project. And what that's essentially
22 doing is slowing down development.

23 If you look at New York, if you look at some of
24 the opportunities elsewhere up and down the coast, there's
25 a lot of projects that are, you know, designed, they're

1 almost there, but they're not moving forward right now at
2 the pace that we would expect them to. And that's
3 something I think California should really think through is
4 how you're giving enough jet fuel into the process
5 throughout the whole development cycle so that you're not
6 having projects stall and then put your bigger picture
7 goals at risk or our bigger picture goals at risk. So
8 there's a big opportunity/challenge here.

9 I would also posit from the private sector
10 perspective, there's never been more private sector money
11 looking for great infrastructure projects to invest in than
12 there is today. So we need to find ways to try to pull in
13 that private sector funding to solve the red parts of these
14 bars.

15 We can kind of go on to the next slide.

16 So we first built up this bottom-up analysis of
17 how many projects are out there and needed across the
18 country. We then said, what's the gap? We used a bit of a
19 top-down methodology. I don't kind of go into all the
20 numbers here, but they're largely aligned to what was in
21 the AB 525 Report.

22 And we said, well, to understand the funding gap
23 that we have as a country, we first need to understand what
24 is the gap in current projects. We estimate that to be
25 around \$4.1 billion, which if you do the math, \$4.1 billion

1 divided by the number of products that are outstanding is
2 roughly in that range of \$115 or so million per project.
3 And so that's kind of gap one. That's a burning platform
4 that all of us need to be working on.

5 And I would encourage the state of California to
6 think about the product, you know, in Humboldt or the
7 project in Long Beach as in this category of if we don't
8 invest here early, we're not going to de-risk the market
9 and we're really going to risk our goal. So we would say,
10 one, really think deeply about this opportunity. It will
11 create certainty for the whole market for all of us as
12 private investors to further invest.

13 The second chunk, kind of step two on the slide,
14 is there's a whole bunch of other projects. And there's a
15 range of how many we need, but if you kind of look at the
16 top end, there's a bunch of projects that we still need to
17 identify and we still need to push forward. And to do that
18 work starts with little dollars in kind of smaller amounts
19 that are high-risk dollars that you're going to spread
20 across a portfolio of different sites and then you're going
21 to mature those concepts and really try to drive them
22 forward. We also need to be equally addressing that today
23 so that we're not in the same position where we have
24 projects that are kind of failing in the future.

25 When we add those numbers up, we get to a pretty

1 big number on the bottom right of the slide, it's \$27
2 billion. It's probably, you know, in the range of what
3 would make sense given what California has talked about.
4 It's a bit shocking to some other regions. But you start
5 saying \$27 billion, that, as Matt said, that's in today's
6 dollars, that's not escalated, that seems like a lot of
7 money.

8 But if you go to the next slide, we think it's
9 really important to put this into context, that \$27.2
10 billion we're talking about, that red sliver unlocks
11 another \$440 to \$660 billion of investment into clean
12 energy generation, into clean energy jobs. And when you
13 think about it this way, these four percent to six percent,
14 you know, somebody mentioned down payment, we could
15 actually use that concept for this, you know, whether it's
16 \$11 billion to \$12 billion or it is the \$27 billion we're
17 talking about at the national level, that's the down
18 payment that allows us to unlock the blue part. It's what
19 allows us to have ports be this transformative asset that
20 not only deploys offshore wind but turns all that offshore
21 wind spending into jobs for people in those communities and
22 opportunities for local businesses.

23 So if you think about it on a ratio basis, it's
24 16 to 29X, right, the return by investing in port
25 infrastructure in terms of what you're going to get in

1 overall generation investment. This is a common sense
2 thing to do. We just need to figure out how do we rally
3 the right set of resources to figure out that red source of
4 the pie. So if we do that, we're going to get the blue
5 chunk of the pie.

6 If you move on to the next slide?

7 This, again, it may be hard for those who are
8 sitting in the room, but the next step we took, which we
9 think is probably a bit novel compared to some of the other
10 studies, and there have been lots of studies, is we looked
11 at when our projects needed over the course of the next 10
12 to 15 years. And we plotted out those projects using
13 average pre-development timelines, average development
14 construction development timelines, and we said, okay,
15 well, when do they need capital? We got that blue bar, the
16 kind of inside curve there. That's the \$27.2 billion
17 spread out over time.

18 What happens when you spread that out over time
19 is then you have to account for the fact that, well, now
20 there's construction inflation. Construction inflation is
21 bad as we all feel in our pocketbooks, having inflation of,
22 you know, four percent, you know, eight, percent now,
23 construction inflation over the last three years has been
24 in the double digits. Over the last three years, I think
25 it totals 30 or so percent. So factoring that in is a

1 really important part of the policy planning process, and
2 we really need to be thinking about this as a set of long-
3 term investments.

4 On top of that, right, when you add in that,
5 you're adding in additional 20 percent to 30 percent in
6 terms of actual year of expenditure dollars of what we need
7 to think about in terms of our policy. Then we need to
8 think about if it's just if you do the blue plus the purple
9 bar, that gets you to \$36 billion. That's if everything is
10 basically grant funded, and that's probably not realistic.
11 We probably need to use a range of tools, of private sector
12 money, of concessional financing, of private bonding
13 capacity.

14 Well, then we need to start to add in financial
15 costs into that, because there's a reality of what comes
16 with using those mechanisms. We anchor in the \$36 billion
17 as the number, but really when you factor in financial
18 costs, it's probably \$42 billion across the country. Cool.

19 This is pretty big numbers, but it's important
20 for us to think about it in this sort of nuance as you're
21 designing programs. And a grant program is one sliver of
22 this, and it's a really important sliver, but we wanted to
23 set that in the context of how the private sector is
24 thinking about the bigger opportunity here for offshore
25 wind port investment.

1 Perhaps the most important line on this whole
2 chart, and Suzanne and Rob and others, I see them nodding
3 in the audience here, is the reality that I can't wait
4 until whatever back years, back half of this decade, to get
5 those dollars. I need those dollars three years in advance
6 of what I need to spend them, because I have to go raise
7 outside financing, I have to secure efficient contracts, I
8 need to kind of lock in commitments. These are projects
9 that take seven, eight, nine-plus years to develop.

10 We need commitments to funding, even if we don't
11 need to spend those dollars, we need the ability to commit
12 those dollars well in advance of when we need to use them.
13 And this red line is meant to represent that of what is the
14 curve of when we actually need the funding, whether it's
15 private funding or public funding.

16 So I leave this to you all just to help further
17 the conversation of how we should be thinking about
18 investing in port infrastructure, and happy to follow up on
19 this.

20 The last slide, if you don't mind pushing
21 forward, I guess it's a penultimate slide, as part of the
22 report, we put out nine recommendations for both the
23 federal government and states to think about, how do we
24 start to address this really big challenge? \$36 billion,
25 you know, \$42 billion, these are big numbers.

1 We roughly break them into two categories of
2 solutions that are complementary and to some degree
3 substitutes. We can either subsize more of these projects,
4 or you can find ways to spend money and de-risk the
5 projects to pull in more private capital. So subsidize,
6 that category is more about how do we spend private -- oh
7 sorry, public dollars. There's a range of different things
8 that we could do.

9 This grant program squarely fits into kind of
10 that second bucket, and we applaud all of the sponsors of
11 AB 209 for getting ahead. You're one of the first, I will
12 say, three states to really have a really good grant
13 program to start this process. You should feel proud about
14 that. Other states are going to look to you to figure out
15 how to do this. So like there's a great opportunity to get
16 it right and be a national model here.

17 But those are not the only options. And as you
18 move forward, you should be thinking about the fact that
19 there are other opportunities to be both subsidizing as
20 well as de-risking projects using public dollars to pull
21 in, or what we call crowd in, more private dollars.

22 If I just go to the next slide, if I take all of
23 the learning over the last, you know, four or five months
24 as we put this together, and I try to silt it down into
25 what does this mean for your grant program, a couple of

1 things.

2 One, some other states have looked at should we
3 just shove most of the development costs for offshore wind
4 infrastructure into the cost of electricity, into those
5 offshore wind projects, basically put it on the back of the
6 lease holders? I think we found pretty definitively that
7 at best that's inefficient and kind of risky, especially as
8 we've seen in the last week when certain projects, you
9 know, go sideways or canceled. If your infrastructure is
10 then also getting canceled with that, that's not a great
11 infrastructure development strategy.

12 Similarly, like it's also a potentially
13 regressive approach; right? Like infrastructure should be
14 built using tax dollars, not necessarily on the backs of
15 repairs; right? And we need to find the right balance.
16 And using grant programs like this and other tools is
17 probably the right way to fund infrastructure development,
18 even if it is for electricity generation.

19 I think the second really big thing that we
20 learned is we're going to need to get that number, and I'm
21 sorry for going a little bit long here, but we're going to
22 need both public and private investment into these port
23 sites. In most of the ports that we've talked about today,
24 there's publicly regulated and publicly owned facilities,
25 but there's also private facilities. And we, as a set of

1 private investors, are very interested in putting capital
2 to work in this state and in these communities, but we need
3 the ability to help de-risk our projects and de-risk our
4 investments to get that right.

5 So we'd encourage you, as part of your grant
6 program, to allow private entities and private project
7 sponsors to also be eligible entities. And, Eli, when you
8 put up that page, I saw plenty of language that was in the
9 statute, you know, specifically other entities that
10 demonstrated commitment to California offshore wind
11 investments and are partnering with the facility.

12 There was another one that was other waterfront
13 facilities that referenced terminal operators. All of
14 that, we think, gives you wide berth, no pun intended, to
15 allow private sector entities to participate in this
16 program. And we think that allowing that will encourage
17 more private investment into these projects. And often
18 that's done in partnership with public entities, as well,
19 but often it's important for, as a private entity, us to be
20 able to apply for those dollars specifically on our behalf,
21 given the fact that we hold a slightly different set of
22 risks and kind of a different return profile and
23 expectations as we're going through this process.

24 I think the next one is, you know -- oh, sorry,
25 if we pull back one slide, I'll try to run through the rest

1 quickly.

2 I already mentioned this point, but for all of us
3 that are considering a set of projects, I think it's pretty
4 clear that there's a lot of risk in the market, in that
5 having S&I ports that are settled and we kind of know a
6 timeline for it, that helps de-risk the market for
7 everybody. It helps de-risk the market for manufacturing
8 ports. It helps de-risk the market for O&M ports. We
9 would encourage you to do that.

10 However, you also need to be thinking, and I
11 would posit, that those projects are more mature and should
12 probably get a bigger chunk of the grant funding because
13 they have strong financial needs right now. But you need
14 to balance that with also thinking about how are you
15 investing in kind of that next phase of sets of projects
16 with probably a smaller sets of grant money in that
17 Category 1 bucket, spread across a number of projects so
18 that you're raising a portfolio of additional sites that
19 could be eligible.

20 And I think a lot of the folks that you heard on
21 the panel previously were saying that they need that early
22 stage capital and not, you know, tens of millions of
23 dollars, we need a much more manageable amount. And I
24 would think as you design your grant program that you would
25 modulate the requirements based upon the amount of funding

1 so that we don't have to have the same restrictions on a
2 million dollars that you would have on \$20 million. That
3 might be a design feature we would think through.

4 The next thing I think we would say is the scale
5 and the funding is really big. We have a small amount of
6 down payment today but there's a lot of power in building
7 tools that can be scaled over time and that, if you're
8 going through this process, we should think today about
9 building tools that more funding could flow into over time
10 so that we don't have to go through this process again if
11 more funding becomes available. We know there's a deficit
12 situation today but that may not be the case in three years
13 when some certain projects are ready to apply for this
14 funding.

15 And then, you know, of course we need to pair
16 this grant funding with a variety of the other sorts of
17 solutions that were on that page previously.

18 Just two other things that have popped to mind in
19 our conversation and then I'll yield is, one, I would
20 encourage you to have your grant funding solicitation be an
21 open call and not time-based, because I think there's a
22 wide variety of readinesses [sic] in terms of the -- of
23 where different projects are. And if you miss a window and
24 then you have to wait another year to come back that can
25 really slow down development, whereas if you leave a window

1 open then as soon as a project is ready they're going to
2 want to apply. It's first come first serve, right, to some
3 degree there. But it allows you, if you have some chunks
4 of funding set aside for each one of the different pools,
5 it maybe allows you to have a more efficient overall
6 development process.

7 And then the last piece I would note is that
8 there was a -- the next study, AB 3, and how do we start to
9 think about the learnings from this for what we're doing
10 here into that. What should be done is really look at
11 manufacturing ports. We look at that aggressively. And I
12 can tell you, and I'm not going to get in trouble, but
13 manufacturing ports don't pencil; right? Like S&I ports
14 are in the back of a large infrastructure offshore wind
15 energy project. They can probably pay higher rents to
16 those ports that maybe can get closer to paying back the
17 cost of that development. O&M projects maybe can as well.

18 Manufacturing projects with the OEMs are much
19 less willing to pay higher rent values back to the ports.
20 And because of that it's harder to make the business case
21 if I have to drop \$350 million referencing the numbers that
22 are in the AB 525 report. If somebody's paying me a
23 million dollars rent per year to support a 60-acre site,
24 I'm never going to make that business case for a public
25 entity or a private entity. We need to solve that problem

1 if California wants to have more manufacturing in the
2 state. Solving manufacturing port infrastructure is going
3 to be critical to that.

4 So with that I'll pause. And I know we have a
5 lot of really smart folks who have other perspectives other
6 than mine, so --

7 MR. HARLAND: Great. Thank you so much Brian for
8 the presentation. And if we have time for questions after
9 the presentations, there might be some that leadership has,
10 a few came to my mind, so we'll see if we get there.

11 But, Sean, we're going to turn it over to you, so
12 name, full name and organization before you get started,
13 and pass it over to you. Thanks.

14 MR. BOYD: Thank you, Eli. Thank you to the
15 panel and the workshop attendees. I don't have any slides.
16 I'll keep this relatively brief.

17 My name is Sean Boyd. I work with Ernst & Young
18 in the Infrastructure Advisory Group. We are management
19 consultants, financial advisors, largely working for state
20 across the U.S. We work on most of the big multi-billion
21 dollar programs that are underway. For the last several
22 years we've been advising the State of New Jersey on their
23 wind port. We are now retained by the Port of Long Beach
24 to support their preparation of a business plan for their
25 Pier Wind project. We've been in dialogue with multiple

1 ports up and down the West Coast and the Gulf of Mexico.

2 The wider firm I work for supports offshore wind
3 developers, tax equity financiers, and all parts of the
4 supply chain. So we bring a whole variety of independent
5 perspectives to this issue and I personally am now immersed
6 in the offshore wind port market. I'm based in Los
7 Angeles.

8 I would just offer a few brief perspectives.
9 Much of it is echoing what's already been said, but in case
10 it's helpful for the CEC and the other members of the panel
11 here to hear it, I think our perspective on the AB 209
12 funds, number one, is they have a tremendous possibility to
13 send a signal which is urgently needed. The challenges
14 facing offshore wind on the East Coast and the long lead
15 time ahead of us on the West Coast to actually develop
16 these ports and then develop the offshore wind market I
17 think does mean that strong decisive action and a clear
18 signal from the state that it recognizes critically the
19 staging and integration ports that will then unlock the
20 wider system of offshore wind ports is critical.

21 So I would, I think, from our point of view we
22 would just underline the point that's already been made
23 that getting this grant program out there and allowing
24 applications to come in as soon as possible. It has a very
25 powerful symbolic value which goes beyond the sort of hard

1 dollars that it offers itself.

2 I think the only other comments I'd offer for
3 today is some points have been touched on about the AB 209
4 being a down payment and there's multiple billions of
5 investments ahead of us. Perhaps we can just offer a few
6 perspectives on that area.

7 There's some inconvenient truths out there that
8 perhaps we can offer our point of view on. One, there may
9 be a perception that ports themselves can afford these
10 investments. We can report with confidence, they cannot.
11 Certainly not the small harbors or the smaller ports but
12 even the very large ports in the mix here are in the middle
13 of huge capital programs. They have debt capacity limits
14 that are potentially strained.

15 A lot of ports are moving towards zero emission
16 and green port goals and there is
17 not -- it will not take the state or the state Treasurer's
18 Office long to validate that there is not spare financial
19 capacity sat within the ports to make the investments of
20 the size that we're talking about for offshore wind.

21 Two, even if those ports could afford to make
22 large multi-billion dollar investments into offshore wind
23 ports, that investment must be returned. It must be earned
24 back and returned at a premium. Brian touched on this.
25 It's going to be earned back from rents charged to offshore

1 wind users. Those rents will end up being capitalized by
2 the offshore wind users into their bids for power purchase
3 agreements to the state, to the Department of Water
4 Resources, and those rents will be capitalized at a cost of
5 capital that reflects the full floating offshore wind risk.
6 In other words, a high cost of capital.

7 So it's a very inefficient way to finance port
8 infrastructure, to have too much of the cost of the port
9 financed by rents. And there's a whole discussion to be
10 had in that area.

11 There is something else that's very important
12 that I think it would be good to have on our radar, which
13 is the ability of a port or a port investor, whether it's a
14 private equity investor, a port operator or a publicly
15 owned port, but the ability of that investor to project and
16 forecast future rents from offshore wind uses can be
17 difficult in a nascent market. The need and appetite for
18 offshore wind capacity at ports is dependent on future
19 power purchase auctions by the state and by future sea
20 space auctions by the federal government and, of course,
21 other areas such as transmission and permitting.

22 There's a number of very significant variables
23 which mean that the projection of rents over the long term,
24 over a multi-decade span for an offshore wind port will not
25 be straightforward.

1 And so it all adds up to, I think, a need for a
2 sort of very robust and thoughtful dialogue between the
3 state and the ports about what's the best way to tackle
4 these issues and hit them head on. And we stand ready to
5 support that.

6 Thank you. That's it.

7 MR. HARLAND: Thank you, Sean. We appreciate
8 your participation today and those remarks.

9 So we'll move back into the room.

10 Sloane, you have a slide deck and a presentation,
11 and after that, we'll go to Molly, so go for it, Sloane.
12 Oh, yeah, first name, last name, organization.

13 MS. PERRAS: Sure. And I'll start with just a
14 couple of opening comments to frame it. My name is Sloane
15 Perras. I'm a Vice President of Supply for Foss Offshore
16 Wind. I'm sure everybody in the port world knows Foss.
17 We're a 135-year-old maritime company. Our parent company
18 is the largest Jones Act company in the country. And we
19 have one in three tugs on the West Coast and we operate in
20 all of your ports.

21 Foss also has a spin off, which is Foss Offshore
22 Wind, which is the entity that I am in. And we are devoted
23 100 percent to the offshore wind renewable energy market.

24 Just to kind of refresh, because I know it's
25 Friday afternoon, we're all getting tired, but to frame

1 what's happening in California, what's going to happen on
2 the West Coast, also the Gulf and eventually the East
3 Coast, to meet the Biden administration's goal of 110
4 gigawatts of offshore wind by 2050, floating wind is
5 required to meet 50 percent of that goal. So when you
6 think about the scope of what floating wind is going to be,
7 think about that.

8 And I want to put it in perspective. Foss is
9 providing the barge solution for fixed bottom wind for
10 vineyard wind off of Martha's Vineyard. It's a 13 megawatt
11 turbine. To meet the 110 gigawatt goal, you would need
12 3,515 megawatt floating turbines, or the equivalent of 57
13 vineyard-wind wind farms. That is a lot. And we are going
14 to go bigger.

15 We do hope that California can meet the 20 to 25
16 megawatt goals and reduce the footprint and reduce the
17 impact. But we are talking about a lot of footprint, a lot
18 of impact, even with the bigger turbines.

19 And I'm going to quote some statistics. Each of
20 us quotes statistics from different sources, so they don't
21 always line up, and it's just what's included and what's
22 excluded. I'm going to grab one from NREL and the
23 Department of Energy. The U.S. supply chain requires \$11
24 billion in investment to meet just the 2030 goal and about
25 \$22.4 billion or \$34 billion in investment overall for

1 ports, vessels, and manufacturing facilities. More
2 specifically, this includes 34 manufacturing facilities.

3 I pulled them out because, like Brian, I
4 understand that there can be more challenges with
5 manufacturing facilities. These are a number that are not
6 already in operation or under construction, all of which
7 are going to need to be near water with naturally deep
8 waterways and very, very strong bulkheads, which are very,
9 very expensive.

10 I bring this up because I think something that
11 the East Coast is finally figuring out is something that
12 the West Coast is already really good at. And I will say,
13 it took years for New England to decide to work together.
14 And Massachusetts and Rhode Island and Connecticut only
15 very recently came out with their cooperation agreement.
16 They are cooperating on PPAs. I don't think the West Coast
17 is there. I think California is clearly pretty far ahead
18 and will continue to be far ahead in being open to lease
19 areas.

20 But one thing that I think the West Coast can
21 take a page from the East Coast, or from at least New
22 England starting to cooperate, is the opportunity for
23 California, Oregon, and Washington to cooperate on the
24 supply chain. Very similar to what Rob said when he was
25 providing the presentation at Humboldt, there is a lot of

1 offshore wind to go around. And \$34 billion or \$21 billion
2 or whatever number, you know, I think I added it up, the
3 \$6.5 billion that just the ports covered in the room today,
4 that's a lot of money for one state to come up with, going
5 to the federal government by itself for matching funds.

6 An idea that I would encourage the CEC, the State
7 Lands Commission, the Governor's Office, is think about how
8 to work with your partner states and put secondary supply
9 chain in other states, in Oregon, in Washington state that
10 has additional harbors. I think that they're not ready or
11 as far along in offshore wind, but I think they do have,
12 like Long Beach, like some of your other ports, like San
13 Diego, they have shipyards, they have a trained workforce,
14 and they can probably support your supply chain and help
15 California meet its clean energy goals faster.

16 So just something to kind of keep in mind that
17 there is so much offshore wind to go around. It's only
18 going to help facilitate California meeting its goals to
19 think about using its other West Coast states in its
20 process.

21 On the private investment front, we are -- Foss
22 Offshore Wind is uniquely situated as one of the only
23 owners of a private offshore wind terminal in the country
24 right now. And my slides are going to kind of take you
25 through what a different perspective of an offshore wind

1 terminal.

2 And let me preface this by saying staging and
3 integration ports have to come first. They are the
4 priority. What Humboldt is doing, what Long Beach is
5 doing, they absolutely need the funding. These terminals
6 can wait until projects are closer to the timeline. But if
7 you forget about having these sorts of terminals that I'm
8 going to talk about in a minute, you will not have
9 successful projects any more than if you forgot staging and
10 integration ports.

11 So our facility, which a proof of concept is in
12 New Bedford, Massachusetts, this is what the site
13 originally looked like. It was an old power plant. It
14 actually started as a whaling port. It's the site for Moby
15 Dick, if any of you like the classics, and it went from
16 whale oil to coal to natural gas, and now it's going to
17 offshore wind. But because we were continuing to use the
18 site for energy, the city gave us the demolition permit to
19 take down the largest building in New Bedford, which was
20 the coal power plant.

21 Next slide.

22 We are going to take a shutdown decommissioned
23 power plant and turn it into a multi, I call it a supply
24 port, most people would call it an O&M site. And so when
25 you drive up to the site, you have insulated parking from

1 the community, so 350 car spots, which means people aren't
2 parking in your neighborhoods. They aren't parking in your
3 stores and your bank parking lots. They're able to have
4 secure parking in the facility and they come up to a
5 terminal center where the technicians who are coming on and
6 off shifts every two weeks can go to work.

7 This particular facility, which is shown right at
8 the front of the driveway, can throughput 100 technicians a
9 day. That's one to two SOVs coming in to take technicians
10 out to the wind farm. And then we have, in this particular
11 picture, smaller warehousing, about 10,000 square feet for
12 Tier 2 suppliers.

13 So the anchor tenants for O&M facilities, at
14 least for Foss Offshore's particular strategy, are
15 developers. And so we have relationships with multiple
16 developers who will be on our site. And each of them are
17 looking at long term 15-, 20-, 30-year contracts where they
18 do provide very competitive rent as low as they can drive
19 it down because of the other cost factors in their market.

20 But we also have Tier 2s come in. And those are
21 companies that are for floating wind, doing small
22 fabrication, small manufacturing, chains, anchors, things
23 like that. And they also are going to be operating for the
24 life of the wind farm. And so you're looking at additional
25 10-, 15-, 20-year contracts where you have multiple tenants

1 on a site.

2 And I should mention New Bedford's about 26
3 acres. So this is not a huge site. It can actually be a
4 fairly reasonable size that fits into a lot of your
5 different port footprints.

6 Next slide, please.

7 This just gives different details if you wanted
8 to know what is required to make a terminal center
9 operational.

10 You can go ahead and go to the next slide. I
11 won't go through the details of that.

12 And this is some details around the smaller
13 warehouses. And then here are small vessel port -- small
14 vessel slips. Those are about 150 feet long. They're
15 designed for CTVs, crew transport vessels. I don't know if
16 crew transport vessels work on the West Coast with the
17 difference in the Pacific versus the Atlantic. The Pacific
18 wave height is just a little bit higher, a little bit
19 rougher. The water is a little bit deeper. So whereas
20 CTVs are a normal part of the process on East Coast wind
21 farms, I think it remains to be seen whether they would be
22 necessary for West Coast wind farms.

23 But what these do fit are your ocean going tugs,
24 so a 100 to 100-ton bollard pull tug about. Ours are about
25 128 feet long. These are 150-foot berths. And we all know

1 that tugs are going to be part of this story for offshore
2 wind, so you'll still need berths of this size regardless.

3 Next slide. You can skip past that. That's just
4 some detail for anyone who wants it.

5 This is an overhead look at the site. You get a
6 little bit better idea of the multi-tenant aspect of the
7 site. So the large buildings near the center of the
8 picture, each of those is a two-acre lot. It houses about
9 a 30,000 square foot warehouse and 5,000 square feet of
10 office. That constitutes an O&M facility for a developer.

11 It would have probably 50 workers per two acre
12 site. So new job creation. This is not going to drive as
13 many new jobs as a manufacturing site. But what it is
14 going to drive is people to live in the neighborhoods, live
15 and work near where they're at, eating at the local
16 restaurants for lunch every day, using the local banks, the
17 local shops, the local retail. And so what O&M sites can
18 do is they can provide a secondary economic lift, even if
19 they can't provide the sheer number of manufacturing new
20 jobs that a manufacturing facility could provide.

21 You'll see we have three deep water berths.
22 Typically what we find -- there's actually a fourth, the
23 CTVs you see on the right hand side will be a fourth deep
24 water berth -- is developers tend to want an exclusive deep
25 water berth for their SOV. And so if you have two deep

1 water berths, you probably will only sign with two
2 developers. If you have four deep water berths, you can
3 probably sign with four developers.

4 These have to be around 350 feet long. And the
5 depth for an SOV is right around 30 to 33 feet deep. So a
6 lot of your channels are already deep enough for SOVs, even
7 in some of your smaller ports. The regular dredging that's
8 going on with the Army Corps of Engineers is going to be
9 sufficient, which makes your ports better within probably a
10 three-hour ride of your lease areas, good potential O&M
11 sites. And we are looking at some of them for O&M
12 facilities on the West Coast.

13 Then you have cranes for loading additional
14 warehouses. Those circular spools are cable reels. This
15 particular site will probably end up with all warehousing.
16 But something that I haven't heard anybody talking about on
17 the West Coast is where are you going to store the cable,
18 and not just the cable for the internal arrays and export
19 cable, but also the cable and chain for the mooring
20 systems? What happens when a mooring system breaks?

21 Well, there will be redundancies built into the
22 design, I'm sure, but you're going to want to be able to
23 change those out, which means you're going to have to have
24 stock somewhere. And your ports that have vertical air
25 restrictions are great places for cable, anchors, chains,

1 things that can be barged or towed out without worrying
2 about the height of the bridge.

3 And so just something to think about. There's a
4 variety of uses of ports. And the more that you think out
5 of the box or the more that you figure out where you're
6 staging an installation, and I'm looking at Suzanne and Rob
7 as I say that, where you figure out where those ports go,
8 you can start to figure out the uses of your other ports.

9 And there are a lot of other uses and then there
10 are combination uses. On this facility, we're looking at a
11 small manufacturing facility for a motion compensation
12 system that goes on the barge. We're talking to a concrete
13 supplier who makes the caps that go on the foundations to
14 keep water out until the turbines are installed. And so
15 there are lots of small 10,000, 15,000 square foot
16 manufacturing facilities, businesses that tend to be more
17 of small businesses and qualified businesses because
18 they're not in such a large role in the supply chain.

19 And so the other thing that we do when we look at
20 an O&M facility is we do a lot of community work, we do a
21 lot of workforce development, and we look at the supply
22 chain, not at the top level, not at the Tier 1 where the
23 developer contracts, but we look at the Tier 2, Tier 3s,
24 Tier 4s.

25 And as you push down through the supply chain,

1 that's often where you can bring in qualified businesses
2 and small businesses. That's their comfort level. That's
3 where they can grow and stretch their revenue and they can
4 become part of the offshore wind story and grow their own
5 businesses. They can't take on the billion-dollar job
6 risk. But if you bring them in through the fabrication and
7 manufacturing process and you give them homes and these O&M
8 ports, then you can bring them in. And that's something
9 that we've tried really hard to do in New Bedford working
10 with our developers and our tier ones.

11 Next slide.

12 That is a very busy drawing of what that looks
13 like for a diagram.

14 Next slide.

15 And just to finish up, we are a private investor.
16 We did buy the facility. We have been awarded one \$15
17 million grant from the State of Massachusetts. Our
18 (indiscernible) Victorian, and so even without the need to
19 bring them up to the strength of floating wind standards,
20 it's still a very expensive process.

21 I think Brian and Sean both made really good
22 points about rent doesn't pay the bills back when you
23 borrow the money. Whether you borrow it through debt
24 financing or you borrow it through an equity investment,
25 you do have to find other ways to create the return to

1 entice the investors.

2 What O&M facilities do is they provide husbandry
3 services to all the vessels that come into the port. They
4 provide port agency services, and so those high-volume,
5 low-margin transactions are what build the return for
6 private investment.

7 I think that AB 209, the Grant Program, is a
8 wonderful grant program. I hope it's the first of many
9 because as I was counting up the dollars that just the
10 public ports need. I don't know how you fit private ports
11 into this first allocation, but I think a really important
12 message for the CEC and the State Lands Commission to take
13 back is to do additional grant programs and to leave the
14 option open for private ports and private investors, like
15 the people you're hearing from say, not because we need to
16 be in this first round, because maybe we don't yet, maybe
17 we can wait a little bit longer because our horizons are
18 not coming as quickly.

19 But we do need help and we do need state matching
20 funds when we're investing in these facilities because we
21 don't just invest in the port. Just like the developer,
22 just like the Port Authority, we have to invest in the
23 community. We have to create a footprint, a presence. We
24 have to ensure the well-being of the communities around us.
25 And so we are investing just as much effort and time and

1 bandwidth into our facilities as a port authority does or a
2 city does into their surrounding community.

3 And so I would just encourage all of y'all to
4 keep that in mind when you're looking at kind of those
5 other California waterfront facilities or those of us who
6 are investing and working with those facilities that this
7 has a lot of worthwhile effort, and we provide a lot of
8 public good as well.

9 And I will wrap it up there.

10 MR. HARLAND: Great. Thank you, Sloane. A lot
11 of the folks might know who Foss is, but this was my
12 introduction to Foss, actually, so thank you for being
13 here.

14 And I want to turn it over to Molly. Molly, it's
15 great to have an offshore wind industry perspective on
16 everything we've talked about today because we've had ports
17 and some of the investors and experts in it, but really
18 hearing, I think, like an industry perspective is going to
19 help us round out some of our thoughts, so I'll turn over
20 to you, name, organization, and then go for it.

21 MS. CROLL: Thank you, Eli. I'm Molly Croll, the
22 Pacific Director of Offshore Wind for American Clean Power
23 Association, or ACP. We're the largest clean energy trade
24 association in the U.S., advocating for state and national
25 policy. And in California, we have all five of the first

1 offshore wind leaseholders as our members, and I work
2 closely with that group. So my perspective is not finance
3 but bringing a policy background and speaking on behalf of
4 the leaseholders and what we would like to see from this AB
5 209 funding.

6 Eli gave a great overview of the AB 209 statute.
7 And I think what we see in that is that it provides some
8 clear, you know, direction to the CEC, but also provides
9 for a lot of discretion to the Energy Commission to decide
10 what is the best use of this particular pot of funding
11 right now, at this point in time. And I think the Energy
12 Commission already has what it needs to make those
13 decisions.

14 It's done a lot of work leading up to the AB 525
15 Strategic Plan. Matt gave a really excellent presentation
16 this earlier today on the Moffatt & Nichol report, which
17 will feed into the Strategic Plan, and that has some clear
18 conclusions. I'm just going to quote, for emphasis, one of
19 them, which Matt also said today.

20 "The conclusion, of the port sites that were studied,
21 staging and integration, operations and maintenance,
22 and mooring cable laydown, S&I sites are the most
23 critical sites that require urgent funding. These
24 sites must be developed as soon as possible to provide
25 the state with the best opportunity to achieve the

1 offshore wind planning goals. And the state will
2 require three to five 80-acre S&I sites to meet the
3 2045 goals. And the report recognizes further that
4 both Port of Humboldt and Port of Long Beach have
5 announced projects to provide the acreage for all
6 three to five of these sites."

7 So to me, that's really kind of the answer to the
8 main question of today of what to do with AB 209 funds.
9 And really every month that ticks by where we don't have
10 certainty from the state about their commitment to those
11 two S&I ports is more time lost toward our progress of
12 meeting our first AB 525 goals and getting projects online
13 in the early 2030s.

14 At the same time, offshore wind developers are
15 looking for progress in the S&I ports of understanding, you
16 know, final designs there, what the cost will be, is the
17 timeline achievable, and they're going to need that
18 information to be responding to power purchase contract
19 solicitations from the central procurement entity in the
20 next few years.

21 So just as Sloane was talking about there, or
22 maybe it was Brian, there's sort of a this is happening in
23 that developers need to know what's it going to cost and
24 what's the timeline from ports. Ports need to know from
25 developers, well, what's the actual timeline for you being

1 tenants? What is the total pipeline of the need? And the
2 answer to that pointing at each other is start moving with
3 big quantities of money now.

4 I think, you know, as Port of Humboldt and Port
5 of Long Beach have described, as well, the success of the
6 first offshore wind projects is very much tied to the
7 success of the first S&I ports. It was really exciting to
8 hear from the variety of ports and harbors that are
9 interested in participating in this industry. Absolutely
10 want to encourage that. We need a network of ports. There
11 is enough offshore wind to go around. But I think it's a
12 matter of those can maybe wait. Don't forget about them.
13 Have that be part of the broader plan, but those can
14 potentially wait.

15 And one way I think about is what are the key
16 drivers? So for S&I ports, it's really state investment
17 right now. We need that \$43 million to be starting to
18 leverage federal funds and private funds. And we've seen
19 in the case of the Port of Humboldt, state money, even if
20 it's not huge, huge quantities, does start to be able to
21 pull in some additional federal funding, and private.

22 On the other hand, the key driver that I see for
23 manufacturing ports is really about what is going to draw
24 in those OEMs and supply chain companies to decide to
25 invest in manufacturing facilities in California. And,

1 yes, the port location is important, the port feasibility,
2 but it's really the pipeline of purchase orders that
3 they're going to have from developers, which is tied to
4 procurement.

5 And then lastly, manufacturing -- sorry,
6 operations and maintenance, very important, but will be
7 kind of tied to developers site servicing plans. And
8 those, you know, have lower infrastructure investment fund
9 requirements and can probably, you know, wait for a later
10 date.

11 This certainly shouldn't be the last time that we
12 talk about offshore port funding, and I think everyone here
13 has echoed that. But for now, to me, it's really about
14 focus on the S&I ports. And we have that sort of clear
15 answer in the first two ports that have been investing on
16 their own and making substantial progress toward what is
17 already going to be a challenging timeline.

18 Finally, and Sean spoke to this a little bit, this is
19 a time of great promise for the offshore wind industry in
20 California and nationally, but it's also a time of some
21 uncertainty. And we also have our, you know, friends and
22 neighbors, like in Washington, sort of chomping at our
23 heels to be part of this as well.

24 So what the state does with this money is an
25 important signal to the state's commitment and strategic

1 leadership in the offshore wind industry, and California
2 and the CEC should show the ports that have already stepped
3 forward and are taking risks that the state recognizes them
4 and is here to support them. Offshore wind needs decisive
5 leadership. And for this AB 209 funding, that means
6 investing in Port of Long Beach and Humboldt and doing it
7 quickly. I would disagree a little with Brian about
8 keeping this solicitation open. You have the funds. You
9 have the authority. Dispense with them quickly.

10 Thank you.

11 MR. HARLAND: Got it. Thanks, Molly. And
12 appreciate walking through the different port types in your
13 comments because that was one of the questions that we
14 actually had that we're looking for a reaction to, so I
15 thought that was helpful.

16 And in the interest of time, I think we're going
17 to kind of progress through the rest of the schedule.

18 So next up is going to be public comment. We're
19 going to first do public comment in the room. So if you'd
20 like to make a public comment today, there's a microphone
21 at the podium that's up here, you can come up, stand in
22 line, sit in the seats that are up there. We'll have a
23 three-minute timer for those comments, so you'll see that
24 up on the screen.

25 And then after we do public comment in the room,

1 we're going to do public comment through Zoom. So if
2 you're on Zoom and you do want to make comment, please
3 start using the raised-hand feature, that will put you in
4 the queue.

5 And so I'll manage the public comment here in the
6 room, and then when we get to Zoom, Hilarie, I'll let you
7 manage those public comments.

8 So first up --

9 CHAIR HOCHSCHILD: Eli, just before we get to
10 that, I just wanted to make one quick comment. And just
11 let me thank everyone again for terrific presentations, and
12 Molly, especially your comments at the end.

13 I did want to -- you know, I think there's been a
14 lot of attention over the last few weeks on what's just
15 happened in New Jersey and the, you know, the collapse of
16 that particular project and the upward price trend with
17 wind right now, you know, steel prices going up with the
18 war and so on.

19 And I just wanted to, you know, really articulate
20 for everybody, we are taking a long-term view on offshore
21 wind. Our commitment is a long-term commitment. And, you
22 know, if you look at all clean energy technologies,
23 including offshore wind, the price trend over the long haul
24 has been a downward trend, but there are periodic upward
25 ticks in price, and that's what we're seeing now, you know,

1 caused by some external factors.

2 That does not change our commitment. Our
3 commitment is a long-term commitment. And, you know,
4 through innovation and through scale, we're going to drive
5 the costs down. And this is foundational work that really
6 we shouldn't get too distracted by, you know, events like
7 what just happened in New Jersey.

8 I just want to articulate that because I think
9 it's really important framing for, you know, how we view
10 this resource and why the governor and the legislature have
11 directed us to have these planning goals and work to build
12 this industry. So I just wanted to make that point and
13 look forward to the public comment.

14 MR. HARLAND: Great, thanks.

15 Okay, so it looks like we've got a couple that
16 are going to make public comment. I invite you up to the
17 podium. Name for the court reporter will be really
18 helpful.

19 MS. KIRSHNER-RODRIGUEZ: Great.

20 MR. HARLAND: Thanks.

21 MS. KIRSHNER-RODRIGUEZ: Nancy Kirshner-
22 Rodriguez, as of Monday, the Oceantic Network, formerly the
23 Business Network for Offshore Wind. And my comments today
24 is, A, to thank the Energy Commission and, of course, the
25 State Lands and others that have been here today. But we

1 are so pleased to see this focus on ports now and really
2 delving into the next portion of the work that is ahead.
3 And the Network was very proud to work with our Ports
4 Working Group, which I coordinate, but I'm very grateful to
5 Brian Sabina for his expertise and the team that we put
6 together to put this report together. And I think it gives
7 a lot of context.

8 We do recognize, and I want to mention that one
9 of the other things that we do do is in our priorities and
10 focus are on supply chain. And now we have over 550
11 California-based companies that have entered our Supply
12 Chain Connect Project. And we also are extremely committed
13 to the long-term work that it's going to take to build out
14 a domestic supply chain. And I think you heard a lot today
15 about how integral the ports are to figuring that all out.

16 So thank you very much.

17 MR. HARLAND: Thank you.

18 Okay, next up.

19 MS. ANDERSON: Before we move on, can she -- we
20 need to have everybody spell their first and last name for
21 the court reporter. So can the last commenter come back
22 and do that?

23 MS. KIRSHNER-RODRIGUEZ: Sorry. No problem.

24 Nancy, so N-A-N-C-Y, Kirshner, K-I-R-S-H-N-E-R, and then
25 hyphenated Rodriguez, R-O-D-R-I-G-U-E-Z. Thanks.

1 MS. ANDERSON: Great. Thank you.

2 MR. JACOBSON: Thank you very much. My name is
3 Dan, D-A-N, Jacobson, J-A-C-O-B-S-O-N, Senior Advisor to
4 Environment California.

5 First, I really want to thank everyone up here on
6 the dais, the California Energy Commission, the State Lands
7 Commission, for not just today but really for your years of
8 dedication to offshore wind. It's easy to think that this
9 is just something that we're wrestling with right now, but
10 for those of us that have been involved in it a while, we
11 know it's been your almost, well, probably more than a
12 decade thinking about this. And it's because of your
13 dedication that we're in such a good place right now. So
14 thank you all very much for your work on this.

15 One point I would make is that going forward on
16 panels like this, I also -- I'm really glad that the ports
17 were able to come, but we should try to expand the panels
18 so that they include folks from labor, folks from the
19 communities can come in, because there's a lot that we want
20 to hear from them and really make sure that we can speed
21 this process up is going to include getting good
22 communication.

23 There's three points that I want to make in terms
24 of the funds. The first is on the 209 grants. I think
25 that any time the state is giving out money to the ports

1 for offshore wind, we should try to look for triple bottom
2 line winds on this. So the first is, how can we be
3 accelerating clean energy to stave off the worst impacts of
4 climate change? Two is, how can we be cleaning the air in
5 and around those ports for the communities that have been
6 disadvantaged on that? And three is, how do we require
7 that the ports really involve with community engagement?

8 It's so good to hear all the ports here with
9 clean energy plans, with climate plans, with community
10 engagement plans. The state should be rewarding the ports
11 that do such a good job to be able to do that.

12 The second thing I would encourage people to do,
13 and I was just over at the swing space and got an earful
14 from a bunch of staffers saying, hey, the ports need to
15 spend that money that we gave them. So I think a couple
16 people have already said that. I would just encourage you
17 to be able to do that. That's going to be critical going
18 forward.

19 And then three is, in 2024, I think there is an
20 opportunity, a political opportunity to get engaged here.
21 There is a potential for a climate bond that could go on
22 the ballot. If such a bond were to go on, it would be
23 fantastic if we could include money for ports that are
24 doing offshore wind. There is a coalition that's been
25 established that includes labor, that includes business,

1 environmental groups, environmental justice groups, many of
2 the ports. That coalition is critical, and we need to be
3 able to engage the governor's office leadership in the
4 state legislature to encourage them to look at the great
5 opportunity and the return on investment that investing in
6 the ports that are doing offshore wind will provide to the
7 state.

8 So I'll yield back the rest of my time. Again,
9 want to thank the CEC and the State Lands Commission.

10 Thank you.

11 MR. HARLAND: Thank you for your comment.

12 Hilarie, I don't see anybody else lining up in
13 the room for in-person public comments, so if you have
14 hands raised on Zoom, I'll turn it over to you.

15 MS. ANDERSON: Great. Thank you so much. Yes,
16 we have about eight hands raised. We will start by going
17 down the list of the first that I had.

18 And for individuals that are on Zoom, if you're
19 calling in by phone, please press star nine to raise your
20 hand and star six to unmute when you're called upon. I'll
21 open your line. Please make sure to unmute on your end.
22 For the record, you're going to state and spell your name
23 and give your affiliation, if any, and then begin with your
24 comment. We'll show a timer on the screen that will alert
25 you when your time is up, and then all comments will become

1 part of the public record.

2 I will go in the order of the hands that I see
3 received, so first I have Greg Hurner.

4 Greg, you should be allowed to talk now.

5 MR. HURNER: Great. Thank you very much. Greg,
6 G-R-E-G, Hurner, H-U-R-N-E-R, on behalf of American
7 Waterways Operators, the tug, towboat, and barge
8 association.

9 I think you've had some fantastic comments today.
10 I particularly liked Matt Trowbridge's comments about the
11 needing to confirm the capacity of the tug and barge
12 industry. And, of course, you had Foss offshore wind there
13 to provide some perspective in that regard.

14 I think in this, in looking at this perspective,
15 one thing that you need to look at is workforce
16 development. The industry needs more workers. We had some
17 supply chain disruptions during the COVID pandemic which
18 brought to light some of these challenges. And that's
19 going to be a very important component for the tug
20 industry.

21 In addition, you have sister agencies that are
22 imposing significant burdens on the industry, including the
23 Commercial Harbor Craft Rule which was predicted to cost
24 the tugboat industry \$1.3 billion before inflationary COVID
25 factors affected the industry. And that is just to upgrade

1 the existing fleet that operates in California. That is
2 not to build new vessels that will be necessary to meet the
3 requirements of offshore wind.

4 So we strongly encourage more investigation in
5 this area and to not leave out these downstream support
6 industries that are going to be critical to ensuring both
7 the development and ongoing maintenance of this new
8 industry in California.

9 Thank you.

10 MS. ANDERSON: Thank you for your comment.

11 Okay, so we'll move on to the next person that I
12 see, and that is Chanel Wynn [sic].

13 Chanel, just as a reminder, you will -- I'll
14 unmute on my end -- or I'll give you permission to talk,
15 you unmute on your end, and state and spell your name and
16 any affiliation you might have. You should be able to
17 unmute on your side, if you can. I see you've unmuted, but
18 I don't hear you.

19 MR. REED: This is John Reed. Are you trying
20 to --

21 MS. ANDERSON: Oh, I'm sorry. Your name says
22 Chanel -- or ChannelWind. I'm sorry.

23 MR. REED: Oh, okay.

24 MS. ANDERSON: I don't have a name, so please
25 state and spell your name and then --

1 MR. REED: Okay.

2 MS. ANDERSON: -- and give your comment.

3 MR. REED: Okay. thank you. This is John Reed,
4 and I'm with ChannelWind LLC in Santa Barbara, California.
5 And I'm happy to hear all the comments about ports and the
6 go-forward plan and, of course, this opportunity to share
7 in the public money that's coming from the CEC and
8 California.

9 And I just wanted to spend a little time talking
10 about our project because it's going to take an effort
11 between many different partners to pull it off, and that is
12 to create part of the capacity delivery system using a
13 floating port facility, mobile port facility concept, as
14 stated in last September's report from NREL, that it's a
15 disruptive technology that I think our state should try to
16 be part of. The beginning studies and the beginning
17 feasibility, there's lots of advantages from a process
18 manufacturing supply chain point of view. There's also
19 advantages to not disrupting as much shoreline space in our
20 beautiful state.

21 And if you want to know more, anyone on the call,
22 reach out to info@channelwind.com. I'm just a small
23 startup in Santa Barbara. I met Matt before, so it's good
24 to hear you again today, Matt.

25 And yeah, just looking forward to this industry

1 taking off and allowing small companies like ours to get
2 some seed funding and solve some of the biggest problems
3 that could help not just the state, but our whole country
4 and maybe the world.

5 Thank you.

6 MS. ANDERSON: Great. Thank you so much.

7 And I'm going to reset our clock here. We'll go
8 on to our next commenter.

9 Alihan [sic], you should be able to unmute on
10 your end and --

11 MS. HAHM: Hi. Can you hear me?

12 MS. ANDERSON: Yes. Please state your name and
13 spell your name and any affiliation you might have and then
14 start your comment.

15 MS. HAHM: Thank you. My name is Allison Hahm,
16 A-L-I-S-O-N H-A-H-M. I'm an attorney with Natural
17 Resources Defense Council's Environment, Equity, and
18 Justice Center, and a proud member of the Impact Project,
19 which includes community based organizations, environmental
20 justice groups, and academic institutions, as well as
21 national environmental NGOs.

22 NRDC supports the development of offshore wind
23 off the coast of California to meet the state's clean
24 energy and climate goals. And we welcome the work of CEC
25 to develop a program to support the development of this new

1 renewable energy infrastructure.

2 NRDC also believes that it's crucial to advance
3 offshore wind in a way that minimizes negative ecological
4 consequences and maximizes benefits to port-adjacent
5 communities, communities that are already
6 disproportionately burdened by industrial operations and
7 extreme air pollution from truck and ship emissions. It's
8 our hope and expectation that offshore wind development
9 will improve life expectancy in communities living on the
10 front lines of industrial and port operations.

11 For this reason, we urge CEC to first maximize
12 community benefits. Offshore wind projects must require
13 use of zero-emission vehicles, equipment, and
14 infrastructure during project construction, operation, and
15 maintenance. We also hope that offshore wind projects will
16 invest in charging infrastructure to support zero-emission
17 equipment and vehicles at project sites.

18 Second, CEC must remediate waterfront facilities
19 with legacy pollution from previous industrial uses before
20 workers commence offshore wind-related operations to ensure
21 worker safety and health.

22 And finally, we urge CEC to promote a rapid
23 phase-down of fossil fuel infrastructure and other
24 polluting sources in conjunction with clean energy
25 infrastructure development to avoid a potential increase in

1 cumulative impacts from offshore wind-related construction,
2 maintenance, and operations.

3 In conclusion, I'd like to thank CEC for
4 facilitating today's workshop, initiating community
5 listening sessions, and reaching out to tribal nations to
6 discuss the benefits and potential risks associated with
7 offshore wind development. We urge CEC to include more
8 community voices and perspectives from tribal nations and
9 workforce during the next workshop. Strengthening and
10 continuing this open dialogue is vital to ensure the
11 offshore wind industry is a catalyst for improving quality
12 of life, in port-adjacent communities, and advancing
13 environmental justice.

14 Thank you so much for your time.

15 MS. ANDERSON: Thank you so much.

16 We'll go on to our next commenter, Adam Stern.

17 Adam, please unmute on your end. State and spell
18 your name and any affiliation, and start your comment.

19 MR. STERN: Thank you, Hilarie. It's Adam Stern,
20 Executive Director of Offshore Wind California. My first
21 name is spelled A-D-A-M. Last name is Stern, S-T-E-R-N.

22 Very pleased to experience and watch this
23 presentation today. Congrats to the leadership from the
24 CEC and the State Lands Commission for organizing the
25 panels.

1 One of the things that I find very inspiring in
2 listening today is just the overall presentation from Matt,
3 which articulated a growing confidence that the multi-port
4 strategy that is described can actually be achieved, and to
5 see the detail of all of the different components and the
6 way in which this could work from north to south to support
7 the offshore wind sites, I think, is a big confidence
8 booster for the overall industry.

9 There is an urgency here to get the funding out
10 the door that is available, and so I echo Molly Croll's
11 comments about supporting particularly the staging and
12 integration ports, which clearly are central to achieving
13 our goals here, and doing that as promptly as possible, and
14 also acknowledging some of the other needs that have been
15 described in terms of the operating and maintenance sites.

16 I also want to put a finer point on the
17 opportunity for the climate bond and for including up to a
18 billion dollars in funding in that. As Dan Jacobson
19 described, this is a way to leverage the state's borrowing
20 capacity. Something like port investment deserves to be
21 financed to some degree by the credit of the State of
22 California. It's on a scale of investment that bonds are
23 appropriate for. And we have an opportunity in 2024 to put
24 this in front of the voters, give them a chance to vote yes
25 on offshore wind, among all the other things that we want

1 to support in terms of climate resilience and preparing us
2 for the climate future that is ahead.

3 So I'm very encouraged by the, you know, overall
4 conclusions of this panel, the set of panel presentations,
5 and support moving as expeditiously as possible and sending
6 the funding from AB 209 out, as well as looking ahead to
7 bigger investments that could be achieved through a climate
8 bond.

9 Thank you very much.

10 MS. ANDERSON: Thank you, Adam.

11 We'll set the clock here and we'll move on to our
12 next commenter.

13 Sheri Hafer, you should be able to unmute on your
14 end.

15 MS. HAFER: Can you hear me?

16 MS. ANDERSON: Yes, you can. Please state and
17 spell your name and any affiliation.

18 MS. HAFER: Okay. My name is Sheri Hafer, that
19 is S-H-E-R-I H-A-F-E-R, and I'm the Secretary of the
20 Central Coast Women for Fisheries.

21 The California Constitution only uses the word
22 "absolute" in reference to one fundamental right. It is
23 not freedom of speech, press, privacy or religion, which
24 some might expect. It is a freedom enjoyed and protected
25 by all who fish in public trust waters of the state of

1 California, reserving in the people the absolute right to
2 fish thereupon. Absolute means something that is free from
3 any restriction or condition.

4 So the endeavors that you go forward with in
5 altering our ports, in doing that, you must mitigate for
6 fishing. There will be impacts with increased ship
7 traffic. There will be competition for fuel dock supply
8 and for dock space. There will be times when the harbor
9 has to close in order to move the turbines. And there'll
10 be dredging. All these impacts must be mitigated and a
11 plan must be in place before you begin activities.

12 Thank you.

13 MS. ANDERSON: Thank you.

14 We will move on to our next commenter, Tom Hafer.

15 Tom, you should be able to unmute on your end.

16 Please state and spell your name, give any affiliation, and
17 begin your comment. Tom, you'll have to unmute on your
18 end. Okay, I'm going to move on to the next commenter and
19 we'll come back to you, Tom.

20 Sachel Canes (phonetic), I don't know if that's
21 a company or -- so we'll open your line. Please state and
22 spell your name and affiliation.

23 MR. RAY: Can you hear me? Can you hear me?

24 MS. ANDERSON: Yes. Tom, we're going to come
25 back to you in just a moment. We can hear you now.

1 MR. RAY: You can hear me?

2 MS. ANDERSON: Oh, who is this? Yes.

3 MR. RAY: Okay. Yeah, well, I'm using Sachel
4 Canes' phone, so I guess that's what showed up on your
5 screen. My name is Steve Ray.

6 MS. ANDERSON: Okay.

7 MR. RAY: Can I speak?

8 MS. ANDERSON: Yes.

9 MR. RAY: Hello? Yes? Okay. Yes, my name is
10 Steve Ray, that's S-T-E-V-E R-A-Y, nice and easy.

11 I work with a lot of nonprofit, NGO, and
12 community groups up and down the coast of California. I've
13 been involved in this for nearly 40 years. And I wanted to
14 speak to you about public participation in this process.

15 First of all, let me congratulate you. This has
16 been an excellent panel. It was nice to hear from Moffatt
17 & Nichol and all of the work they've been doing, and from
18 the ports, from the industry, from the investment
19 community. But what's a little silent is the voice of the
20 public here. And I would like to come up.

21 I have a suggestion for you, because there are
22 many people out here in the communities that are going to
23 be directly or indirectly affected by these ports, by these
24 windmill operations, and by all of the other ancillary
25 businesses that are going to be needed to support them.

1 And I would suggest that at your councils, in your
2 meetings, in your workshops, there should be regular
3 citizens, as it were, sitting in on those. We can
4 represent various groups. We represent different
5 communities. But we represent the regular citizens of the
6 state. And I think we need a voice in this process.

7 If California is going to be a driver in this
8 nationwide and set the example for everybody, I would
9 recommend that since you have this proposition money, or AB
10 209 money, and there is a provision in there for other
11 types of investments, I would suggest that maybe a small
12 portion of that be reserved to help fund nonprofit and
13 community groups who can be involved in this process, who
14 can bring some knowledge and experience and capability to
15 the table and participate more fully in this. Funding is
16 always a difficulty, as you probably know, for nonprofit
17 groups. But if there is a grant program that would enable
18 groups to participate in this on an equitable level, I
19 think that would be helpful.

20 So I would ask that in your considerations you
21 look at the possibility of creating some sort of grant
22 program for nonprofit groups that would enable that
23 participation.

24 And with that, I thank you very much.

25 MS. ANDERSON: Thank you for your comment.

1 Okay, we are going to try and go back to Tom.
2 Tom Hafer, you should be able to unmute your
3 line.

4 MR. HAFER: Can you hear me?

5 MS. ANDERSON: Yes, we can hear you now great.
6 So if you could state and call your name, give any
7 affiliation and start your comment?

8 MR. HAFER: Tom Hafer, T-O-M H-A-F-E-R. I'm the
9 President of the Morro Bay Fishing Organization [sic].

10 I heard a comment, and I think it was somebody
11 from Crescent City, that it's a myth that commercial
12 fishing will not be impacted. That's not true. We're
13 going to be impacted with everything that goes on in the
14 ocean. We're going to be impacted by cable lanes. We're
15 going to be impacted by call areas. And if the State of
16 California wants to put 25 gigawatts of wind in by 2045, we
17 keep hearing, it's going to devastate and it's going to
18 affect the commercial fishing and sport fishing in the
19 state of California.

20 And I don't know why nobody will recognize that.
21 It's like everybody's throwing the commercial fishermen
22 under the bus. It's not right. I mean, just the call area
23 alone off Morro Bay that's 400 square miles or whatever it
24 is, 376 or 400, I don't know what it is now, but we're not
25 going to be able to fish there anymore. That's an impact.

1 They're going to be pounding and trenching the cables,
2 that's going to be an impact, not just the fishermen, it's
3 going to devastate the fish, the rockfish.

4 So when people say that it's a myth that
5 commercial fishermen won't be impacted, that's not true.
6 And I wish BOEM and whoever is running the show on this
7 whole offshore wind thing would recognize that because we
8 are going to be devastated from this. And it's going to
9 cause a lot of impact.

10 Thank you.

11 MS. ANDERSON: Thank you for your comment.

12 I'm going to go on to the next commenter, and
13 that's Thalia Kruger.

14 Thalia, your line is open. You should be able to
15 unmute on your end. And state and spell your name, your
16 affiliation, and make your comment.

17 MS. KRUGER: Thank you very much, Hilarie. My
18 name is Thalia Kruger, it's spelled T-H-A-L-I-A, last name
19 Kruger, K-R-U-G-E-R, and I represent Principal Power, the
20 California-based technology leader in floating technology.

21 My comments are first to applaud the California
22 Energy Commission and the Lands Commissions for organizing
23 this excellent workshop. I also applaud all the presenters
24 because they have been very engaging and bringing up the
25 reality to what we are facing in the industry.

1 My comments are related. I would like just to
2 call your attention that whenever we are discussing ports,
3 staging and installation of ports or manufacturing ports or
4 marshalling ports, we need to pay attention to the wet
5 storage. I saw the plans of -- the schematics of the ports
6 that were presented, and I didn't see that taken into
7 consideration. Maybe I missed something, but it is very
8 important. In Principal Power, if we find that if there is
9 no wet storage capability, then that's going to be a
10 bottleneck for the large-scale deployment of floating wind
11 in California.

12 And also, the second comment that I have is the
13 long-forward view of preparing the ports for large
14 corrective activity, so also looking into what are the
15 characteristics of the ports that are going to be needed in
16 20, 15, 20 years, whenever we need to have that kind of
17 activity.

18 Thank you very much.

19 MS. ANDERSON: Thank you.

20 And let's see, that was the last hand I saw
21 raised, so I'm going to do one more call for any raised
22 hands for comments in the public comment section. If you
23 have -- if you're calling in from the phone, you can do
24 star nine to raise your hand if you're calling in,
25 otherwise, it looks like a raised palm on the bottom of

1 your screen. Okay, I'm seeing no more hands.

2 I just want to remind everyone that we're also
3 accepting written comments, which are due by December 1st,
4 so that's next month.

5 And this will conclude the public comment period,
6 and I'm going to send it back to Eli.

7 MR. HARLAND: Great. Thank you, Hilarie, and
8 thanks everyone for hanging in there and making comments.

9 Before I close out the workshop with a few
10 reminders, I did want to invite Chair Hochschild,
11 Commissioner Monahan, and Jennifer Lucchesi to make any
12 closing remarks before we close ourselves out.

13 So go for it, Chair.

14 CHAIR HOCHSCHILD: Great. Well, thank you so
15 much, Eli, for all the work. This was a really, really
16 robust workshop today, and I just am very grateful. It
17 felt like a pretty thorough tour through all the
18 possibilities with the various port investments we can
19 make.

20 And to the earlier comment by the member of the
21 public about public comment, there will be many, many more
22 opportunities for public comment, in addition to wind-
23 specific events like this and others that we'll be hosting.
24 Members of public are always welcome at our monthly Energy
25 Commission meetings to provide public comment on any topic,

1 including offshore wind. So we welcome that and look
2 forward to much, much more public engagement as we go
3 forward.

4 And let me also just thank, again, Jennifer
5 Lucchesi from the Lands Commission for being just such a
6 terrific partner in this work and looking forward to
7 building out this program successfully in close
8 collaboration with the Lands Commission and all the
9 stakeholders here.

10 And with that, I'll pass it off to my colleague,
11 Commissioner Monahan.

12 COMMISSIONER MONAHAN: Well, I, too, I feel like
13 my head is exploding a little bit. That was a lot of
14 information to share, and so I really appreciate all the
15 panelists for sharing their expertise and giving us a lot
16 of food for thought. And I think, as the Chair said,
17 we're, as a state, are just deeply committed to making this
18 happen.

19 And so we want to learn how to do it right, how
20 to do it in the most cost effective way, how to do it with
21 the most sensitivity to the needs of communities, to the
22 environment. Really heard the message from commenters
23 about the importance of engaging communities and engaging
24 labor and making sure that this is a really robust
25 collaboration, that we're hearing from all stakeholders and

1 just taking that to heart.

2 But just this was -- I feel like, you know, we
3 need to do this for the sake of moving California to a 100
4 percent clean energy future. You know, we were lucky this
5 summer with wildfires, although not so lucky right now.
6 And I think California has really been feeling the impacts
7 of climate change very acutely. And this is a key part of
8 our decarbonization strategy, but we have to do it right,
9 and we have to do it with a lot of sensitivity for
10 communities and making sure that this is part of an
11 economic driver for the state of California going forward,
12 so thanks, everybody.

13 And I'm not sure, any other comments from the
14 dais?

15 CHAIR HOCHSCHILD: I think Jen Lucchesi was going
16 to say a few words.

17 COMMISSIONER MONAHAN: Oh, Jen, are you? I can't
18 see if you're there.

19 MS. LUCCHESI: That's okay.

20 COMMISSIONER MONAHAN: You're very small on my
21 screen.

22 MS. LUCCHESI: Yeah, I don't think I could say it
23 any better than you, Chair Hochschild and Commissioner
24 Monahan. Thank you both for your leadership. And I just
25 learned so much from these last three and a half, four

1 hours. And I'm incredibly grateful for all of our
2 panelists for spending so much time with us today,
3 especially on a Friday afternoon and traveling so far for
4 many of you. And equally grateful for the public comments
5 that we received.

6 So thank you, and I look forward to continuing to
7 learn and partner with you all. Thank you.

8 MR. HARLAND: Yep, agreed. Thank you so much for
9 everybody who came to participate actively in the workshop
10 today. We wouldn't have a workshop if we didn't have
11 content. And so you came and provided that content,
12 especially all of those that traveled in person, greatly
13 appreciate it.

14 Also wouldn't have a workshop if we didn't have
15 folks supporting us to leading up to the workshop and in
16 the workshop itself. So just real fast, I wanted to thank
17 Hilarie Anderson for all of your support on Zoom today.
18 You really make this stuff happen, and it feels like it's
19 magic, and I know it's a lot of work. So Hilarie, thank
20 you so much.

21 Kevin, who's in the back, is our IT support and
22 really helped us out today.

23 And then the Energy Commission, you probably
24 interact a lot with folks who are on the kind of technical
25 side or the policy side of this, but also wanted to thank

1 Bill Dietrich and Kelli Nishimori, who are both of our
2 attorneys assigned to help us with this program, and
3 they're transactions experts. So thank you to both of
4 them. And Lizzie Barminski, who's my partner in this
5 program, helped prepare for the workshop today.

6 Just a reminder, the slides from today, as soon
7 as we get them prepared and ready to be posted in an ADA-
8 compliant way, we will be posting those to the docket.
9 We'll send out a message. The workshop was recorded
10 through Zoom today. That Zoom recording will probably be
11 the first thing that's available that we'll post there.
12 Also, the workshop is being transcribed, so a transcript
13 will be available.

14 Again, encourage everyone to sign up for the
15 LISTSERV specifically for this program. It's available on
16 the website at the URL listed on the slide.

17 And again, to remind everyone, written comments
18 by December 1st would be much appreciated. You can use our
19 e-commenting system to do that. You can also submit
20 written comments directly to our Dockets Unit. The email
21 for the docket is on the slide.

22 So with that, we're going to adjourn, and we're
23 closed out. Everybody have a fantastic weekend and safe
24 travels home.

25 CHAIR HOCHSCHILD: Thanks, everyone.

REPORTER'S CERTIFICATE

I do hereby certify that the testimony in the foregoing hearing was taken at the time and place therein stated; that the testimony of said witnesses were reported by me, a certified electronic court reporter and a disinterested person, and was under my supervision thereafter transcribed into typewriting.

And I further certify that I am not of counsel or attorney for either or any of the parties to said hearing nor in any way interested in the outcome of the cause named in said caption.

IN WITNESS WHEREOF, I have hereunto set my hand this 16th day of November, 2023.

A photograph of a handwritten signature in black ink on a light-colored surface. The signature is written in a cursive style and appears to read "Chris Caplan".

Chris Caplan
Electronic Reporter
CER**1971

CERTIFICATE OF TRANSCRIBER

I do hereby certify that the testimony in the foregoing hearing was taken at the time and place therein stated; that the testimony of said witnesses were transcribed by me, a certified transcriber and a disinterested person, and was under my supervision thereafter transcribed into typewriting.

And I further certify that I am not of counsel or attorney for either or any of the parties to said hearing nor in any way interested in the outcome of the cause named in said caption.

I certify that the foregoing is a correct transcript, to the best of my ability, from the electronic sound recording of the proceedings in the above-entitled matter.

MARTHA L. NELSON, CERT**367
