- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.

- The county counsel shall inform the county recorder of his/her determination within a reasonable amount of time, not to exceed three months from the date of your request.
- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.
- The modification document shall be indexed in the same manner as the original document and shall contain a recording reference to the original document.

Lawful restrictions under state and federal law on the age of occupants in senior housing or housing for older persons shall not be construed as restrictions based on familial status.”

NOTE: The RCM provided with your title product MAY NOT be the same form required by your county recorder’s office; please double check your county recorder’s office before completing this form.

The process at the county recorder’s office is as follows:

- The county recorder takes the RCM with the redacted document and the original document attached and submits it to the county counsel for review to determine if, from a legal standpoint, the language was an unlawfully restrictive covenant and thus the redacted version should be indexed and recorded.
- The county counsel shall inform the county recorder of his/her determination within a reasonable amount of time, not to exceed three months from the date of your request.
- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.
- The modification document shall be indexed in the same manner as the original document and shall contain a recording reference to the original document.

- The county counsel shall inform the county recorder of his/her determination within a reasonable amount of time, not to exceed three months from the date of your request.
- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.
- The modification document shall be indexed in the same manner as the original document and shall contain a recording reference to the original document.

- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.
- The modification document shall be indexed in the same manner as the original document and shall contain a recording reference to the original document.

- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.

- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.
- The modification document shall be indexed in the same manner as the original document and shall contain a recording reference to the original document.

- If county counsel determined that the redacted language was unlawful then, once recorded, the redacted document is the only one that effects the property and this modified document has the same effective date as the original document.
- If county counsel determined that the redacted language was not unlawful then county counsel will return the RCM package to the county recorder and the county recorder will advise the requestor that same the request has been denied and the redacted document has not been recorded.

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing

A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

PFAS PART 139 AIRPORT: All Certified Part 139 Airports PFAS Information Listing

Since July 1, 2006, all certified part 139 airports are required to have fire-fighting foam onsite that meet military specifications (MIL-F-24385) (14 CFR 139.317). To date, these military specification fire-fighting foams are fluorinated and have been historically used for training and extinguishing. The 2018 FAA Reauthorization Act has a provision stating that no later than October 2021, FAA shall not require the use of fluorinated AFFF. This provision does not prohibit the use of fluorinated AFFF at Part 139 civilian airports; it only prohibits FAA from mandating its use. The Federal Aviation Administration's document AC 150/5210-6D - Aircraft Fire Extinguishing Agents provides guidance on Aircraft Fire Extinguishing Agents, which includes Aqueous Film Forming Foam (AFFF).

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

PHASE II ENVIRONMENTAL SITE ASSESSMENT

Introduction
September 25, 2023

Executive Summary

Stantec Consulting Services Inc. (Stantec) has completed this Phase II Environmental Site Assessment (ESA) for the property located on approximately 9,116 acres of land near the census designated place known as Cantua Creek in Fresno County, California (the "Subject Property"), on behalf of IP Darden I, LLC (the "Client"). The work was performed in accordance with Stantec's proposals dated August 18, 2022 and October 31, 2022, and the statements of work (SOWs) issued by IP Darden I LLC on September 13, 2022 and March 29, 2023, in accordance with the Master Services Agreement (MSA). IP Darden I, LLC (the "User") has been designated as the User of this report. The intended use of this Phase I ESA is for due diligence in support of the developing the parcels with renewable energy infrastructure.

This Phase II ESA was conducted in conformance with the requirements of ASTM International (ASTM) Designation E1903-11 Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process.

The Subject Property consists of forty-two parcels comprising approximately 9,116-acres of land located along the west side of State Route-177 (SR-177) and 9.5 miles northeast of the junction at State Route-145 (SR-145) and Interstate-5 (I-5), near Cantua Creek in Fresno County, California (Figure 1). A list of the Subject Property parcels is Section 2.0. The Subject Property parcels are primarily undeveloped land that were formerly used for agricultural purposes (row crops). Limited row cropping remains on certain parcels near the central portion of the Subject Property.

Stantec performed a Phase I ESA for the Property in 2022. During that assessment, Stantec's review of historical aerial photographs found that the Subject Property has been used for agricultural purposes (row cropping) since at least 1940. Oil exploration (well drilling) occurred on the Subject Property sporadically between 1939 and 1982. All seven wells mapped as being drilled on the Subject Property were reported to be dry holes, and were subsequently "plugged" according to records obtained from the California Geologic Energy Management (CalGEM).

Organochlorine Pesticide, Arsenic, and Lead Assessment (September 2022)

Due to a history of agricultural use that was evident in aerial photographs, Stantec collected soil samples across the Subject Property during the visit in September of 2022, which was conducted in conformance with the requirements of ASTM International (ASTM) Designation E1903-11 Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process. Sampling activities included the collection of shallow soil samples from 0.5 to 1.0-foot below ground surface (bgs) at forty (40) locations across the Subject Property (B-1 through B-40) and from a soil stockpile (B-41) located in the northeast corner of Fresno County Assessor Parcel Number (APN) 050-030-26ST, on September 21, 2022. Soil samples were analyzed for organochlorine pesticides (OCPs), and the metals arsenic and lead, which are commonly associated with historical herbicide and pesticide application.

As shown in **Table 1**, certain OCPs (4,4'-DDE and 4,4'-DDT), arsenic and lead were identified above laboratory detection limits in certain samples. The analytical results indicated no OCPs or lead

PHASE II ENVIRONMENTAL SITE ASSESSMENT

Introduction

September 25, 2023

concentrations were detected above commercial use screening levels published by the California Department of Toxic Substances Control (DTSC) or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from 6.3 to 13 milligrams per kilogram (mg/kg). Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels.

The data from surface soils (B-1 through B-40) collected at the Subject Property were evaluated statistically for normality and evidence of contamination using the United States Environmental Protection Agency (USEPA) ProUCL statistical program. The 95 percent upper confidence level of the mean was calculated to be 10 mg/kg. Additionally, a Q-Q plot of the data (see **Phase I ESA**) which was performed by Stantec suggests that the data are representative of a single population, meaning that the data are likely representative of a single source such as background native concentrations. Based on the statistical evaluation of the data, Stantec opined that the reported arsenic values appear to be the result of background native concentrations and not related to anthropogenic contamination. No further investigation was recommended regarding the agricultural use of the Subject Property.

The Phase I ESA identified the following potential recognized environmental condition (REC):

- **Potential Mud Pit/Sump** – Oil well records indicate that the seven (7) onsite abandoned oil wells never produced and were found to be “dry holes”. However, there remains the potential that earthen drilling mud pits/sumps were generated at the time the wells were drilled. In the 1940 aerial photograph there appears to be faint evidence of three rectangular depressions/impoundments that are located approximately 100-200 feet west/northwest of the Leoscher “1” well in the northeast quadrant of APN 050-030-24ST. The surface soil in this area does not appear to be discolored but there is the potential that these features could have been mud pits or sumps related to the oil well, and could be located below the ground surface. Historic aerial photographs do not provide any further insight regarding any sumps or mud pits related to the six other onsite wells, most likely because of the short duration (1-3 months) between drilling and abandonment when no aerial photographs were taken, or because no significant indications of petroleum was encountered during drilling activities, and the borehole was deemed to be a “dry hole”.

The potential presence of impacted soils associated with drilling mud pits/sumps is considered a REC. Stantec recommended that further investigation be performed in the area west/northwest of the Leoscher “1” well where the rectangular depressions were noted in the 1940 photograph in order to evaluate potential chemical impact to soil at this location. Since there was no visible indication of mud pits/sumps in any of the other aerial photographs, it was also recommended that a Soil Management Plan (SMP) be prepared that provides the procedures, methodologies and reporting requirements in the event that unknown impacts to soil are encountered during demolition, grading and construction activities at the Subject Property.

In addition, the following items of note were identified during the Phase I ESA and by the client:

- **Abandoned Oil Wells.** According to CalGEM’s Well Finder database, there are seven (7) oil wells at the Subject Property that are designated as abandoned dry holes. Although the onsite

PHASE II ENVIRONMENTAL SITE ASSESSMENT

Introduction

wells have been abandoned, the abandonment activities occurred several decades ago and are unlikely to meet the current abandonment standards set forth by CalGEM. Although unlikely, any future work required by CalGEM on the oil wells would fall on the owner of the Subject Property. Therefore, the abandoned oil wells are considered a business environmental risk (BER) due to financial risks inherent to well ownership imposed by CalGEM. For example, such risk could arise if the abandoned oil well casings interfere with the layout of the proposed facility or infrastructure to be installed. In these instances, CalGEM would need to be notified of any physical alterations (casing height adjustments) made to the wells in order for proper permitting to make these alterations. Such alterations would require IP Darden, LLC to become the operator of the well and could lead to additional work being required by CalGEM, including re-abandonment. As a result, Stantec recommended that the abandoned well casing locations be avoided. Since the well locations mapped on the CalGEM Well Finder website can be off by several hundred feet, the most efficient way to plan avoidance measures is to (1) locate the well using geophysical surveying techniques (i.e., ground penetrating radar and/or magnetic survey) to detect the steel casing, (2) excavate down to the well casing to physically confirm its location, and (3) have the project civil engineer survey its location and add the location to the development plan.

- **Regional Selenium Concentrations.** The client informed Stantec that the Fresno County Planning Commission requests that soil sampling for selenium in shallow soils in the region where the Subject Property is located. As a result, Stantec recommended revisiting locations where prior sampling for pesticides, lead, and arsenic was performed to collect additional samples for selenium analysis.

Phase II Investigation (April 2023)

Stantec performed a Phase II ESA at the Property in April 2023 to investigate potential accumulation of selenium in shallow soils, and in June 2023 to investigate the suspect mud/pump pit observed on historical aerial photographs within APN 050-030-24ST and locate historical oil wells on the Property. Selenium sampling was performed on April 11, 2023 and included the advancement of ten (10) hand auger borings (B-1, B-4, B-5, B-10, B-15, B-20, B-25, B-30, B-35, and B-40) to 1.0 foot bgs where prior sampling was performed in September of 2022. The mud pit/sump investigation and oil well locating activities were performed between June 6 and June 9, 2023. Soils encountered during the investigation consisted of silty sand from surface to approximately 4 feet bgs and sandy silt with minor amounts of clay from 4 feet bgs to the maximum explored depth of 8 feet bgs at the suspected mud pit/sump site. No stained or odorous soils were encountered in any of the borings or test pits advanced during the investigation. Further, the clay identified proximate to the mud/sump site were identified to be native, and not anthropically generated related to historic oil exploration activities.

The results of the investigation are as follows:

- **Potential mud pit/sump.** Five (5) test pits were excavated to 8 feet bgs in the area where there was indication of surface impoundments in the 1940 aerial photograph (see **Figure 2** for location). No stained, odorous or non-native soils were observed in any of the test pits. As a result, no soil samples were collected from the test pits. No further investigation is recommended

with regard to the surface impoundments noted in the 1940 aerial photograph to the northwest of the “Loescher” 1 well.

- **Abandoned Oil Well Search.** The oil well search included vegetation clearance, geophysical surveys, and the excavation of test pits to visually confirm the top of the steel well casings. The abandoned well search activities successfully located all seven (7) of the wells recorded by CalGEM records as being located within the boundaries of the Subject Property. Six (6) of the abandoned wells were located via geophysical survey and subsequent test pit excavations to expose the casings. One of the wells (“Loescher” 1) is surrounded by a concrete platform and a 4-inch diameter steel marker extends up from the well cellar.

The table below summarizes the results of the abandoned oil well survey, including their surveyed locations.

- **Selenium Results.** Selenium was not detected above the laboratory reporting limits of 5.0 mg/kg in any of the samples (*i.e.*, the results were “non-detect”) and below the USEPA residential and commercial use screening levels of 390 mg/kg and 5,800 mg/kg, respectively. As a result, no further assessment is recommended with regard to selenium at the Subject Property.

Based on the results of this investigation, the RECs identified in the Phase I ESA have been assessed and no further investigation is recommended.

Stantec identified the following business environmental risk (BER) associated with the Subject Property:

- **Soil Management Plan.** Historic aerial photographs do not provide any further insight regarding any sumps or mud pits related to the six other onsite wells, most likely because of the short duration (1-3 months) between drilling and abandonment when no aerial photographs were

collected, or because no significant indications of petroleum was encountered during drilling activities, and the borehole was deemed to be a “dry hole”. Stantec recommended that a Soil Management Plan (SMP) be prepared as a contingency document that provides procedures, methodologies and reporting requirements in the event that unknown impacts to soil are encountered during grading, trenching, or other construction activities that would involve ground disturbance at the Subject Property. The SMP has been prepared and is included as **Appendix C** of this report.

- **Abandoned Oil Wells.** The top of each of the abandoned oil well casings were surveyed by Westwood Professional Services and will be added to future development plans so that the well locations can be avoided during construction. In the event that these oil well casings are encountered during construction activities, the well casing should not be altered/modified or cut to adjust its elevation. Any modifications or alterations performed on the well casing could prompt requirements from CalGEM for the landowner to become the operator of the well with incurred costs to make such alterations or adjustments. Depending on the well condition and the past abandonment methods, such alterations or modifications could lead to requirements for re-abandoning the wells. Therefore, the presence of the abandoned wells are considered a BER and avoidance of the well casings is crucial.

The preceding summary is intended for informational purposes only. Reading of the full body of this report is recommended.

PHASE II ENVIRONMENTAL SITE ASSESSMENT

Introduction

1.0 INTRODUCTION

Stantec Consulting Services Inc. (Stantec) has prepared this Phase II Environmental Site Assessment (ESA) report for the property located on approximately 9,116 acres of land near the census designated place known as Cantua Creek in Fresno County, California (the “Subject Property”, Figure 1). Site assessment activities presented in this report were completed in accordance with Stantec’s *Proposal to Perform Phase II Environmental Site Assessment*, dated October 31, 2022 and ASTM E1903-11. The scope of work and the results of the investigation are described herein.

1.1 PROPERTY DESCRIPTION AND OPERATIONS

The Subject Property consists of forty-two parcels comprising approximately 9,116-acres of land located along the west side of State Route-177 (SR-177) and 9.5 miles northeast of the junction at State Route-145 (SR-145) and Interstate-5 (I-5), near Cantua Creek in Fresno County, California (Figure 1). The Subject Property parcels are primarily undeveloped land that were formerly used for agricultural purposes (row crops). Limited row cropping remains on certain parcels near the central portion of the Subject Property.

The surrounding parcels in all directions are current or former agricultural land (row crops). Residences, agricultural storage yards, miscellaneous agricultural and irrigation equipment was also observed on these surrounding agricultural properties. The Subject Property boundary is shown on **Figure 1**. Subject Property detail is depicted on **Figure 2**.

1.2 PROPERTY GEOLOGY AND HYDROGEOLOGY

The area is located within the Great Valley Geomorphic Province, which is a large alluvial plain between the highlands of the Sierra Nevada Mountain range and Coast Ranges into which sediments have been deposited since the Jurassic (California Geological Survey [CGS], 2002). The stratigraphy underlying the Subject Property and the vicinity consists of recent-age alluvium consisting of fan and basin deposits (California Department of Mining and Geology [CDMG], 1958).

The Subject Property, as is most of California, is located in a seismically active area. The nearest active fault is the Nunez Fault, located approximately 23 miles south of the Site (CDMG, 1994). The Nunez Fault is part of an Alquist Priolo Special Studies Zone (CDMG, 2002b). The San Andreas Fault is located approximately 34 miles southwest of the Site (CGS, 2011). The Site is within an Alquist Priolo Special Studies Zone (CDMG, 2002b).

The Subject Property is located within the Westside subbasin (5-22.09) of the San Joaquin Valley Groundwater Basin (California Department of Water Resources [CDWR], 2013). The Westside subbasin comprises approximately 1,000 square miles underlying portions of Fresno and Kings Counties. Groundwater monitoring data for the Subject Property was not reasonably ascertainable. Depth to groundwater information for the “Helm Facility” 12688 South Colorado Avenue in Helm, California approximately 4.5 miles to the northeast was provided in a groundwater monitoring report prepared by

PHASE II ENVIRONMENTAL SITE ASSESSMENT

Introduction

Simplot. Based on information provided in Simplot's 2021 Biennial Groundwater Monitoring Report, groundwater historically ranged between 110 and 130 feet below ground surface (bgs) but wells installed within this zone have recently been found to be dry. Groundwater depths in deeper screening wells indicate that groundwater water levels, as of March 2021, were measured between 170 and 189 feet bgs.

Based on the CDWR Lines of Equal Elevation of Water in Wells, San Joaquin Valley, (Spring 2010) the groundwater flow direction is to the north-northeast but may vary based on local groundwater pumping.

Stantec performed a Phase I ESA for the Property in 2022. During that assessment, Stantec's review of historical aerial photographs found that the Subject Property has been used for agricultural purposes (row cropping and grain) since at least 1940. Oil exploration (well drilling) occurred on the Subject Property sporadically between 1939 and 1982. All seven wells drilled on the Subject Property were found to be dry holes, and were subsequently "plugged" according to records obtained from the California Geologic Energy Management (CalGEM).

Given the historical agricultural use on the Subject Property, Stantec performed shallow soil sampling from 0.5 to 1.0-foot bgs at forty (40) locations across the Subject Property (B-1 through B-40) and from a soil stockpile (B-41) located in the northeast corner of Fresno County APN 050-030-26ST on September 21, 2022. Soil samples were analyzed for organochlorine pesticides (OCPs), and the metals arsenic and lead, which are commonly associated with historical herbicide application. This assessment was conducted in conformance with the requirements of ASTM International (ASTM) Designation E1903-11 Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process.

Phase II Environmental Site Assessment

Background

September 25, 2023

Certain OCPs (4,4'-DDE and 4,4'-DDT), arsenic and lead were identified above laboratory detection limits in certain samples. Analytical results indicated no OCP or lead concentrations above commercial use screening levels or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from 6.3 to 13 milligrams per kilogram (mg/kg). Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels.

The data from surface soils (B-1 through B-40) collected at the Subject Property were evaluated statistically for normality and evidence of contamination of arsenic using the USEPA ProUCL statistical program. Using this program, the 95 percent upper confidence level of the mean for arsenic was calculated to be 10 mg/kg. Additionally, a Q-Q plot of the data suggests that the data are representative of a single population, meaning that the data are likely representative of a single source such as background native concentrations. Based on this evaluation, Stantec opines that the reported arsenic values appear to be the result of background native concentrations and not related to anthropogenic contamination. Therefore, no further investigation is recommended regarding the agricultural use of the Subject Property.

However, the Phase I ESA identified the following potential recognized environmental condition (REC):

- **Past Oil Drilling Operations** – Although the seven (7) onsite abandoned oil wells never produced and were found to be “dry holes”, there remains the potential that earthen drilling mud pits/sumps were generated at the time the wells were drilled. In the 1940 aerial photograph (Section 4.4.2) there appears to be faint evidence of three rectangular depressions that are located approximately 100-200 feet west/northwest of the Leoscher “1” well in the northeast quadrant of APN 050-030-24ST. The surface soil in this area does not appear to be discolored but there is the potential that these features could have been mud pits related to the oil well, and could be located below the ground surface. Historic aerial photographs do not provide any further insight regarding sumps or mud pits related to the six other onsite wells, most likely because of the short duration (1-3 months) between drilling and abandonment when no aerial photographs were taken.

The potential presence of impacted soils associated with drilling mud pits/sumps was considered a REC. Stantec recommended that further investigation be performed in the area west/northwest of the Leoscher “1” well where the rectangular depressions were noted in the 1940 photograph in order to evaluate potential chemical impact to soil at this location. Since there was no visible indication of mud pits/sumps in any of the other aerial photographs, Stantec recommended that a Soil Management Plan (SMP) be prepared that provides the procedures, methodologies and reporting requirements in the event that unknown impacts to soil are encountered during demolition, grading and construction activities at the Subject Property. The SMP has been prepared and is included as **Appendix C** of this report.

In addition, prior to performing the field work related to the Phase II assessment recommended above, the client contacted Stantec to request that additional soil sampling be performed at the Subject Property for selenium in shallow soils due to concerns of elevated selenium in some areas of the region. As a result,

Stantec recommended revisiting locations where prior sampling for OCP, lead, and arsenic was performed in September of 2022 to collect additional samples for selenium analysis.

The remaining sections of this report discuss the scope of work and results of the oil well, mud pit/sump, and selenium investigations recommended above.

Phase II Environmental Site Assessment

Field Investigation

September 25, 2023

3.0 FIELD INVESTIGATION

Prior to the commencement of fieldwork activities, Stantec made the following preparations:

3.1 PRE-FIELD ACTIVITIES

- In accordance with federal Occupational Safety and Health Administration (OSHA) regulations (29 CFR, Section 1910.120), Stantec developed a site-specific Health and Safety Plan (HASP) for the Property. All Stantec personnel and subcontractors associated with the project were required to be familiar with and comply with all provisions of the HASP.

3.2 INVESTIGATIONS

On September 21, 2022, Stantec personnel provided oversight and direction for the following scope of work:

- Forty (40) hand auger borings (B-1 through B-40) to 1 feet bgs at the Subject Property to evaluate shallow soils for OCPs, arsenic, and lead to be preset in shallow soil from past agricultural use;
- One (1) soil sample from a soil stockpile in the northeast corner of APN 050-030-26ST for OCPs, arsenic, and lead.

Stantec collected soil samples across the Subject Property to evaluate the potential for residual OCPs, arsenic, and lead to be preset in shallow soil from past agricultural use. forty-one (41) locations at the Subject Property

In April and June of 2023, Stantec personnel provided oversight and direction for the following scope of work:

- Ten (10) hand auger borings (B-1, B-4, B-5, B-10, B-15, B-20, B-25, B-30, B-35, and B-40) to 1 feet bgs at the Subject Property to evaluate shallow soils for total selenium;
- Excavation of five (5) test pits to 8 feet bgs within the area of the potential mud pits / sumps, as noted in the aerial photograph from 1940;
- Clearance of overgrown vegetation at certain locations where a geophysical survey was proposed in order to search for abandoned oil wells;
- Geophysical survey at six (6) of the abandoned oil well sites at the location of record noted in the well files provided by the CalGEM. Note: the seventh oil well site ("Loescher" 1) is visible at the surface;
- Excavation of test pits to visually confirm the well casing at the locations specified by the geophysicist;

Phase II Environmental Site Assessment

Field Investigation

September 25, 2023

- Backfill of all test pit locations once the civil engineer surveyed the locations of the five (5) buried oil wells that were located.

3.2.1 Soil Boring Procedures

A hand auger was used to collect samples from 1-foot bgs (*i.e.*, the 0.5 to 1 foot interval). Upon reaching the 1-foot sampling depth, the hand auger bucket was removed from the borehole and the contents of the buckets were emptied into an 8-ounce glass jar with Teflon lined lids. The samples were then labeled with their sample ID, sample date, time of collection, logged on a chain of custody, and placed in an ice-filled cooler for transport to the laboratory.

3.2.2 Geophysical Survey

Stantec subcontracted the services of Ground Penetrating Radar Systems (GPRS), a geophysical surveyor, to perform a well locating survey in the approximate areas of the six abandoned well casings that are buried beneath the surface of the ground. The approximate location of the survey was centered around the well locations stated in the well files maintained by CalGEM. Initially the areas surveyed measured approximately 200 feet by 200 feet but were expanded as necessary to located magnetic anomalies giving off the typical signature of a steel well casing.

3.2.3 Test Pit Excavations

Stantec subcontracted the services of Patriot Environmental to excavate five (5) test pits to approximately 8 feet below ground surface (bgs) within the footprint of the potential mud pit / sump site and to uncover the top of the abandoned well casings as marked by the geophysical surveyor.

3.2.4 Field Equipment Cleaning Procedures

To maintain quality control during the collection of selenium samples, the hand auger bucket was scrubbed with an Alconox scrub solution followed by a clean tap water rinse and then a final distilled water rinse.

Phase II Environmental Site Assessment

Laboratory Testing Program

September 25, 2023

4.0 LABORATORY TESTING PROGRAM

Soil samples collected during the September 2022 investigation were delivered under chain of custody to Advanced Technologies Laboratories (ATL) for analyses of OCPs by EPA Method 8081A and arsenic and lead by USEPA test method 6010B. Soil samples collected during the April 2023 investigation were delivered under chain of custody to Jones Environmental, Inc (Jones) for analyses of total selenium by USEPA test method 6010B. Jones is certified to perform hazardous waste testing by the California State Water Resources Control Board Environmental Laboratory Accreditation Program (ELAP).

Due to the lack of staining, odors, or non-native soils at the area where the mud pits / sumps were suspected, no soil samples were collected for laboratory analysis.

Phase II Environmental Site Assessment

Investigation Results

September 25, 2023

5.0 INVESTIGATION RESULTS

On September 21, 2022, OCP, lead, and arsenic sampling was performed at forty (40) locations across the Subject Property (B-1 through B-40) and from a soil stockpile (B-41) located in the northeast corner of Fresno County Assessor Parcel Number (APN) 050-030-26ST.

Selenium sampling was performed on April 11, 2023, and included the advancement of ten (10) hand auger borings (B-1, B-4, B-5, B-10, B-15, B-20, B-25, B-30, B-35, and B-40) to 1.0 foot bgs where prior sampling was performed in September of 2022. The mud pit/sump investigation and oil well locating activities were performed between June 6 and June 9, 2023.

5.1 POTENTIAL MUD PIT / SUMP OBSERVATIONS

No stained, odorous or non-native soils were observed in any of the test pits. As a result, no soil samples were collected from the test pits and no further assessment is recommended with regard to the suspect mud pit / sump site in the 1940 aerial photograph.

5.2 LOCATION OF ABANDONED OIL WELLS

The abandoned well search activities successfully located all seven (7) of the wells recorded by CalGEM records as being located within the boundaries of the Subject Property. Six (6) of the abandoned wells were located via geophysical survey and subsequent test pit excavations to expose the casings. One of the wells ("Loescher" 1) is surrounded by a concrete platform and a 4-inch diameter steel marker extends up from the well cellar. All of the test pit locations were backfilled once the civil engineer (Westwood) surveyed the locations of the abandoned oil well casings. The table below summarizes the results of the abandoned oil well survey.

5.3 ANALYTICAL RESULTS

Laboratory analytical test results from this assessment are attached as **Appendix A**. A summary of the analytical data from this assessment is provided in **Table 1**, along with OCP, lead, and arsenic data from prior sampling performed in September of 2022.

5.3.1 OCPs, Arsenic, and Lead

Certain OCPs (4,4'-DDE and 4,4'-DDT), arsenic and lead were identified above laboratory detection limits in certain samples. Analytical results indicate no OCP or lead concentrations above commercial use screening levels or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from 6.3 to 13 milligrams per kilogram (mg/kg). Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels.

The data from surface soils (B-1 through B-40) collected at the Subject Property were evaluated statistically for normality and evidence of contamination using the United States Environmental Protection Agency (USEPA) ProUCL statistical program. Using this program, the 95 percent upper confidence level of the mean was calculated to be 10 mg/kg. Additionally, a Q-Q plot of the data (see **Appendix I**) suggests that the data are representative of a single population, meaning that the data are likely representative of a single source such as background native concentrations. Further discussion of the statistical analysis is provided in Section 7.0 and the Pro-UCL output data is included in **Appendix I**. Based on this evaluation, Stantec opines that the reported arsenic values appear to be the result of background native concentrations and not related to anthropogenic contamination. Therefore, no further investigation is recommended regarding the agricultural use of the Subject Property.

5.3.2 Selenium

Selenium was not detected above the laboratory reporting limits of 5.0 mg/kg in any of the samples (i.e. the results were "non-detect") and below the US Environmental Protection Agency (EPA) residential and commercial use screening levels of 390 mg/kg and 5,800 mg/kg, respectively. As a result, no further assessment is recommended with regard to selenium at the Subject Property.

6.0 CONCLUSIONS AND RECOMMENDATIONS

The Subject Property consists of forty-two parcels comprising approximately 9,116-acres of land located along the west side of State Route-177 (SR-177) and 9.5 miles northeast of the junction at State Route-145 (SR-145) and Interstate-5 (I-5), near Cantua Creek in Fresno County, California (Figure 1). A list of the Subject Property parcels is Section 2.0. The Subject Property parcels are primarily undeveloped land that were formerly used for agricultural purposes (row crops). Limited row cropping remains on certain parcels near the central portion of the Subject Property.

Stantec performed a Phase I ESA for the Property in 2022. During that assessment, Stantec's review of historical aerial photographs found that the Subject Property has been used for agricultural purposes (row cropping) since at least 1940. Oil exploration (well drilling) occurred on the Subject Property sporadically between 1939 and 1982. All seven wells mapped as being drilled on the Subject Property were reported to be dry holes, and were subsequently "plugged" according to records obtained from the California Geologic Energy Management (CalGEM).

OCP, Arsenic, and Lead Assessment (September 2022)

Due to a history of agricultural use that was evident in aerial photographs, Stantec collected soil samples across the Subject Property during the visit in September of 2022, which was conducted in conformance with the requirements of ASTM International (ASTM) Designation E1903-11 Standard Practice for Environmental Site Assessments: Phase II Environmental Site Assessment Process. The sampling activities and results are also discussed in the Phase I ESA report. Sampling activities included the collection of shallow soil samples from 0.5 to 1.0-foot below ground surface (bgs) at forty (40) locations across the Subject Property (B-1 through B-40) and from a soil stockpile (B-41) located in the northeast corner of Fresno County Assessor Parcel Number (APN) 050-030-26ST, on September 21, 2022. Soil samples were analyzed for OCPs, and the metals arsenic and lead, which are commonly associated with historical herbicide and pesticide application.

As indicated in **Table 1**, certain OCPs (4,4'-DDE and 4,4'-DDT), arsenic and lead were identified above laboratory detection limits in certain samples. The analytical results indicated no OCP or lead concentrations were detected above commercial use screening levels published by the California Department of Toxic Substances Control (DTSC) or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from 6.3 to 13 milligrams per kilogram (mg/kg). Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels.

The data from surface soils (B-1 through B-40) collected at the Subject Property were evaluated statistically for normality and evidence of contamination using the United States Environmental Protection Agency (USEPA) ProUCL statistical program. The 95 percent upper confidence level of the mean was calculated to be 10 mg/kg. Additionally, a Q-Q plot of the data (see **Phase I ESA**) which was performed by Stantec suggests that the data are representative of a single population, meaning that the data are likely representative of a single source such as background native concentrations. Based on the statistical evaluation of the data, Stantec opined that the reported arsenic values appear to be the result

of background native concentrations and not related to anthropogenic contamination. No further investigation was recommended regarding the agricultural use of the Subject Property.

Phase 2 ESA (April 2023)

Stantec performed a Phase II ESA at the Property in April 2023 to investigate potential accumulation of selenium in shallow soils, and in June 2023 to investigate the suspect mud/pump pit observed on historical aerial photographs within APN 050-030-24ST and locate historical oil wells on the Property. Selenium sampling was performed on April 11, 2023 and included the advancement of ten (10) hand auger borings (B-1, B-4, B-5, B-10, B-15, B-20, B-25, B-30, B-35, and B-40) to 1.0 foot bgs where prior sampling was performed in September of 2022. The mud pit/sump investigation and oil well locating activities were performed between June 6 and June 9, 2023. Soils encountered during the investigation consisted of silty sand from surface to approximately 4 feet bgs and sandy silt with minor amounts of clay from 4 feet bgs to the maximum explored depth of 8 feet bgs at the suspected mud pit/sump site. No stained or odorous soils were encountered in any of the borings or test pits advanced during the investigation. Further, the clay identified proximate to the mud/sump site were identified to be native, and not anthropically generated related to historic oil exploration activities.

The results of the investigation are as follows:

- **Potential mud pit/sump.** Five (5) test pits were excavated to 8 feet bgs in the area where there was indication of surface impoundments in the 1940 aerial photograph (see **Figure 2** for location). No stained, odorous or non-native soils were observed in any of the test pits. As a result, no soil samples were collected from the test pits. No further investigation is recommended with regard to the surface impoundments noted in the 1940 aerial photograph to the northwest of the “Loescher” 1 well.
- **Abandoned Oil Well Search.** The oil well search included vegetation clearance, geophysical surveys, and the excavation of test pits to visually confirm the top of the steel well casings. The abandoned well search activities successfully located all seven (7) of the wells recorded by CalGEM records as being located within the boundaries of the Subject Property. Six (6) of the abandoned wells were located via geophysical survey and subsequent test pit excavations to expose the casings. One of the wells (“Loescher” 1) is surrounded by a concrete platform and a 4-inch diameter steel marker extends up from the well cellar.

The table below summarizes the results of the abandoned oil well survey, including their surveyed locations.

- **Selenium Results.** Selenium was not detected above the laboratory reporting limits of 5.0 mg/kg in any of the samples (*i.e.*, the results were "non-detect") and below the USEPA residential and commercial use screening levels of 390 mg/kg and 5,800 mg/kg, respectively. As a result, no further assessment is recommended with regard to selenium at the Subject Property.

Based on the results of this investigation, the RECs identified in the Phase I ESA have been assessed and no further investigation is recommended.

Stantec identified the following business environmental risk (BER) associated with the Subject Property:

- **Soil Management Plan.** Historic aerial photographs do not provide any further insight regarding any sumps or mud pits related to the six other onsite wells, most likely because of the short duration (1-3 months) between drilling and abandonment when no aerial photographs were collected, or because no significant indications of petroleum was encountered during drilling activities, and the borehole was deemed to be a "dry hole". Stantec recommended that a Soil Management Plan (SMP) be prepared as a contingency document that provides procedures, methodologies and reporting requirements in the event that unknown impacts to soil are encountered during grading, trenching, or other construction activities that would involve ground disturbance at the Subject Property. The SMP has been prepared and is included as **Appendix C** of this report.
- **Abandoned Oil Wells.** The top of each of the abandoned oil well casings were surveyed by Westwood Professional Services and will be added to future development plans so that the well locations can be avoided during construction. In the event that these oil well casings are encountered during construction activities, the well casing should not be altered/modified or cut to adjust its elevation. Any modifications or alterations performed on the well casing could prompt requirements from CalGEM for the landowner to become the operator of the well with incurred costs to make such alterations or adjustments. Depending on the well condition and the past abandonment methods, such alterations or modifications could lead to requirements for re-abandoning the wells. Therefore, the presence of the abandoned wells are considered a BER and avoidance of the well casings is crucial.

Notes and Definitions

| | |
|-----|---|
| S4 | Surrogate was diluted out. |
| S12 | Surrogate recovery outside in-house established limit but within method default criteria. |
| S10 | Surrogate recovery was outside of laboratory acceptance limit due to possible matrix interference. |
| R | RPD value outside acceptance criteria. Calculation is based on raw values. |
| M6 | Matrix spike analyte was diluted out. |
| M2 | Matrix spike recovery outside of acceptance limit due to possible matrix interference. The analytical batch was validated by the laboratory control sample. |
| M10 | Matrix spike recovery outside in-house established limits but within method criteria. |
| M1 | Matrix spike recovery outside of acceptance limit. The analytical batch was validated by the laboratory control sample. |
| L5 | Laboratory Control Sample high biased. Sample result/s was non-detect (ND) for the target analyte; therefore reanalysis was not necessary. |
| L3 | Laboratory control sample outside in-house established limits but within method criteria. |
| D10 | Sample required dilution due to dark sample |
| B3 | Analyte is detected in the associated method blank, but the analyte is at least 10x greater in the sample. Therefore, reanalysis is not necessary. |
| ND | Analyte is not detected at or above the Practical Quantitation Limit (PQL). When client requests quantitation against MDL, analyte is not detected at or above the Method Detection Limit (MDL) |
| PQL | Practical Quantitation Limit |
| MDL | Method Detection Limit |
| NR | Not Reported |
| RPD | Relative Percent Difference |
| CA2 | CA-ELAP (CDPH) |
| OR1 | OR-NELAP (OSPHL) |

Notes:

- (1) The reported MDL and PQL are based on prep ratio variation and analytical dilution.
- (2) The suffix [2C] of specific analytes signifies that the reported result is taken from the instrument's second column.
- (3) Results are wet unless otherwise specified.

SOIL MANAGEMENT PLAN

Introduction

1.0 INTRODUCTION

In its role as the environmental professional, Stantec Consulting Services Inc. (Stantec) has prepared this Soil Management Plan (SMP) for the property for the IP Darden I, LLC project near Cantua Creek in Fresno County, California (the “Site “or “Property”, **Figure 1**).

1.1 PURPOSE OF SMP

The purpose of this SMP is to provide protocols for the proper management of unknown impacts to soil or undocumented subsurface features potentially encountered at the Property during grading and construction activities. The SMP has been developed to facilitate the redevelopment of the Site by outlining those specific procedures that will be used for identifying, testing, handling, and disposing of soil containing regulated constituents that may be encountered during the redevelopment activities. Implementing the procedures in this SMP will help to ensure that soil from any encountered Soil Management Area (SMA) – which this document defines as any previously-unidentified area of potentially contaminated soil or subsurface structure containing potential chemical contaminants – is managed in a manner that is protective of human health and the potential environmental liability of the owner, and in general compliance with applicable federal, state, and local regulations.

1.2 PROPERTY DESCRIPTION

The Subject Property consists of forty-two parcels comprising approximately 9,116-acres of land located along the west side of State Route-177 (SR-177) and 9.5 miles northeast of the junction at State Route-145 (SR-145) and Interstate-5 (I-5), near Cantua Creek in Fresno County, California. The SMP is also for the supporting infrastructure including a battery energy storage system (BESS) site, a switchyard substation, high voltage generation tie (“gen-tie”) line easement, and medium voltage (“MV”) collector line easement.

The Subject Property parcels are primarily undeveloped land that were formerly used for agricultural purposes (row crops). The surrounding parcels in all directions are current or former agricultural land (row crops). Residences, agricultural storage yards, miscellaneous agricultural and irrigation equipment was also observed on these surrounding agricultural properties. A Property Location Map is illustrated on **Figure 1**. A Property Vicinity Map illustrating the main features of the Property is provided as **Figure 2**. The Property parcels, or portions thereof (*i.e.*, easements) will be leased or purchased by IP Darden I, LLC in anticipation of development and construction of a solar photovoltaic facility. Therefore, commercial use screening criteria should be used for a basis of risk determination should environmental impacts/contamination be encountered during the redevelopment of the Property.

SOIL MANAGEMENT PLAN

Introduction

1.3 SITE GEOLOGY AND HYDROGEOLOGY

The area is located within the Great Valley Geomorphic Province, which is a large alluvial plain between the highlands of the Sierra Nevada Mountain range and Coast Ranges into which sediments have been deposited since the Jurassic (California Geological Survey [CGS], 2002). The stratigraphy underlying the Subject Property and the vicinity consists of recent-age alluvium consisting of fan and basin deposits (California Department of Mining and Geology [CDMG], 1958). Phase II investigations performed by Stantec at the Property in September of 2022, and in April and June of 2023, found that the upper 4 feet of soil consists of a silty sand and that sandy silt with minor amounts of clay are present from 4 to the maximum explored depth of 8 feet bgs.

The Subject Property, as is most of California, is located in a seismically active area. The nearest active fault is the Nunez Fault, located approximately 23 miles south of the Site (CDMG, 1994). The Nunez Fault is part of an Alquist Priolo Special Studies Zone (CDMG, 2002b). The San Andreas Fault is located approximately 34 miles southwest of the Site (CGS, 2011). The Site is not located within an Alquist Priolo Special Studies Zone (CDMG, 2002b).

The Subject Property is located within the Westside subbasin (5-22.09) of the San Joaquin Valley Groundwater Basin (California Department of Water Resources [CDWR], 2013). The Westside subbasin comprises approximately 1,000 square miles underlying portions of Fresno and Kings Counties. Groundwater monitoring data for the Subject Property was not reasonably ascertainable. Depth to groundwater information for the "Helm Facility" 12688 South Colorado Avenue in Helm, California approximately 4.5 miles to the northeast was provided in a groundwater monitoring report prepared by Simplot. Based on information provided in Simplot's 2021 Biennial Groundwater Monitoring Report, groundwater historically ranged between 110 and 130 feet below ground surface (bgs) but wells installed within this zone have recently been found to be dry. Groundwater depths in deeper screening wells indicate that groundwater water levels, as of March 2021, were measured between 170 and 189 feet bgs.

Based on the CDWR Lines of Equal Elevation of Water in Wells, San Joaquin Valley, (Spring 2010) the groundwater flow direction is to the north-northeast but may vary based on local groundwater pumping.

SOIL MANAGEMENT PLAN

Previous Environmental Investigations

2.0 PREVIOUS ENVIRONMENTAL INVESTIGATIONS

Stantec has completed Phase I and Phase II Environmental Site Assessments (ESAs) at the Property. Those investigations are discussed below.

2.1 PHASE I ENVIRONMENTAL SITE ASSESSMENT AND LIMITED SOIL SAMPLING, PHOTOVOLTAIC SITE, SEPTEMBER 2022

Stantec performed a Phase I ESA and limited soil sampling for the portion of the Property proposed for development as a photovoltaic (PV) site. Stantec's review of historical aerial photographs during the Phase I ESA found that the Subject Property was used for agricultural purposes (row crops and grain) since at least 1940. Oil exploration (well drilling) occurred on the Subject Property sporadically between 1939 and 1982. All seven wells drilled on the Subject Property were found to be dry holes, and were subsequently "plugged" according to records obtained from the California Geologic Energy Management (CalGEM).

Given the historical agricultural use on the Subject Property, Stantec performed shallow soil sampling from 0.5 to 1.0-foot bgs at forty (40) locations across the Subject Property and from a soil stockpile in the northeast corner of APN 050-030-26ST on September 21, 2022. Soil samples were analyzed for organochlorine pesticides (OCPs), and the metals arsenic and lead, which are commonly associated with historical herbicide and pesticide application.

Analytical results indicated no OCP or lead concentrations above commercial use screening levels or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from 6.3 to 13 milligrams per kilogram (mg/kg). Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels.

The data from surface soils (B-1 through B-40) collected at the Subject Property were evaluated statistically for normality and evidence of contamination using the United States Environmental Protection Agency (USEPA) ProUCL statistical program. Using this program, the 95 percent upper confidence level of the mean was calculated to be 10 mg/kg. Additionally, a Q-Q plot of the data suggests that the data are representative of a single population, meaning that the data are likely representative of a single source such as background native concentrations. Based on this evaluation, Stantec opines that the reported arsenic values appear to be the result of background native concentrations and not related to anthropogenic contamination. Therefore, no further investigation is recommended regarding the agricultural use of the Subject Property.

However, the Phase I ESA identified the following potential recognized environmental condition (REC):

SOIL MANAGEMENT PLAN

Previous Environmental Investigations

- **Past Oil Drilling Operations** – Although the seven (7) onsite abandoned oil wells never produced and were found to be “dry holes”, there remained the potential that earthen drilling mud pits/sumps were generated at the time the wells were drilled. The 1940 aerial photograph (Section 4.4.2) shows what appears to be faint evidence of three rectangular depressions that are located approximately 100-200 feet west/northwest of the Loescher “1” well in the northeast quadrant of APN 050-030-24ST. The soil in this area does not appear to be discolored but there was concern that these features could have been mud pits related to the oil well. Historic aerial photographs do not provide any further insight regarding sumps or mud pits related to the six other onsite wells, most likely because of the short duration (1-3 months) between drilling and abandonment when no aerial photographs were taken.
- The potential presence of impacted soils associated with drilling mud pits/sumps was considered a REC. To evaluate the potential REC, Stantec recommended that further investigation be performed in the area west/northwest of the Loescher “1” well where the rectangular depressions were noted in the 1940 photograph in order to evaluate potential chemical impact to soil at this location. Since there is no visible indication of mud pits/sumps in any of the other aerial photographs, Stantec recommended that this SMP be prepared that provides the procedures, methodologies and reporting requirements in the event that unknown impacts to soil are encountered during demolition, grading and construction activities at the Subject Property.

2.2 PHASE I ENVIRONMENTAL SITE ASSESSMENT AND LIMITED SOIL SAMPLING, BESS AND UTILITY CORRIDORS, APRIL 2023

Stantec performed a Phase I ESA and limited soil sampling for the portion of the Subject Property that is proposed for development with supporting solar infrastructure including an alternate battery energy storage system (BESS) site, a switchyard substation, high voltage generation tie (“gen-tie”) line easement, and medium voltage (“MV”) collector line easement.

Structures onsite are limited to small slabs where water well pumps, fertilizer mixing tanks, sediment tanks, and other irrigation equipment is located. Oil staining was observed on two irrigation well pads. The first location was located along the MV collector line easement, located approximately ½ mile west of the intersection of Harlan Avenue and Colusa Avenue (36.444095, -120.202699). The second location was located along the gen-tie line easement, located at the northeast corner of the intersection of Harlan Avenue and Calaveras Avenue (36.443355, -120.283759). Stantec recommended that if any of the proposed gen-tie structures/towers, or belowground collector lines are specifically planned to be constructed within these areas (*i.e.*, where stained soil was located around well pumps) and the lines cannot be rerouted to avoid these areas, that soil samples be collected and evaluated for potential contaminants of concern above commercial use screening levels. As a contingency, this SMP includes procedures and methodologies for sampling or cleanup of these areas should avoidance measures be impractical and the proposed developed affects soils at the irrigation well pump locations.

SOIL MANAGEMENT PLAN

Previous Environmental Investigations

In addition, Stantec's review of historical aerial photographs found that the Subject Property has been used for agricultural purposes (row crop and grain) since at least 1940. Petroleum exploration (oil well drilling) occurred on the Subject Property, and in the vicinity of the Subject Property, from the late 1930s through the 1980s. In total, seven (7) wells were drilled on the Subject Property, were found to be dry holes (*i.e.*, no petroleum production), and were subsequently "plugged" according to records obtained from the California Geologic Energy Management (CalGEM).

Given the historical agricultural use on the Subject Property, Stantec performed shallow soil sampling from 0.5 to 1.0-foot bgs at thirty (30) locations across the Subject Property on April 10, 2023. In addition, select samples were also analyzed for selenium. Analytical results indicated no OCPs, lead, or selenium concentrations above commercial use screening levels or California hazardous waste levels. Arsenic was detected above human health screening levels and slightly above background levels at concentrations that ranged from below the laboratory reporting limit of 5.0 mg/kg to a maximum of 9.0 mg/kg. Arsenic occurs naturally at concentrations well above regulatory health risk-based screening levels, as discussed in **Section 2.1**.

2.3 PHASE II ENVIRONMENTAL SITE ASSESSMENT, PHOTOVOLTAIC SITE, JUNE 2023

Stantec performed a Phase II investigation in June of 2023 that included geophysical surveys and potholing to 1) investigate potential soil contamination or non-native soils within the suspected mud pit/sump near the abandoned "Loescher" oil well, 2) locate abandoned oil well casings, and to 3) collect shallow soil samples for selenium analysis. The results of the investigation are as follows:

- **Potential mud pit/sump.** Five (5) test pits were excavated to 8 feet bgs in the area where there was indication of surface impoundments in the 1940 aerial photograph. No stained, odorous or non-native soils were observed in any of the test pits. As a result, no soil samples were collected from the test pits. No further investigation is recommended with regard to the surface impoundments noted in the 1940 aerial photograph to the northwest of the "Loescher" 1 well.

Stantec recommends, given the absence of visual soil impacts from past oil drilling operations, that any potential impacts associated with these wells be addressed by the use of this SMP, should impacts to soil be encountered during site grading and development.

- **Abandoned Oil Well Search.** The oil well search included vegetation clearance, geophysical surveys, and the excavation of test pits to visually confirm the top of the steel well casings. The abandoned well search activities successfully located all seven (7) of the wells recorded by CalGEM records as being located within the boundaries of the Subject Property. Six (6) of the abandoned wells were located via geophysical survey and subsequent test pit excavations to expose the casings. One of the wells ("Loescher" 1) is surrounded by a concrete platform and a 4-inch diameter steel marker extends up from the well cellar.

SOIL MANAGEMENT PLAN

- **Selenium Results.** Selenium was not detected above the laboratory reporting limits of 5.0 mg/kg in any of the samples (i.e. the results were "non-detect") and below the US Environmental Protection Agency (EPA) residential and commercial use screening levels of 390 mg/kg and 5,800 mg/kg, respectively. As a result, no further assessment is recommended with regard to selenium at the Subject Property.

In accordance with Stantec's Phase I and II recommendations related to unforeseen impacts that may be encountered during grading/redevelopment, Stantec has prepared this SMP which should be retained onsite, conveyed to onsite construction workers, and implemented (if needed) during redevelopment of the Property.

SOIL MANAGEMENT PLAN

Known or Suspected Environmental Conditions

3.0 KNOWN OR SUSPECTED ENVIRONMENTAL CONDITIONS

The CalGEM's Well Finder database indicates that seven (7) oil wells were drilled within the boundary of the Property between 1939 and 1982. A review of government records, aerial photographs, and the Property visit revealed no evidence of oil well related feature (well casings, piping, storage tanks, etc) or contaminated soils with the exception of the "Loescher" well. The "Loescher" well site contains a concrete platform with cellar and a 4-inch diameter steel riser that extends up from the center of platform cella. The location and the 4-inch steel riser matches the information contained in the "Loescher" well records obtained from CalGEM. As mentioned previously, faint evidence of a surface impoundment (mud pit/sump) was observed to the west/northwest of the "Loescher" well in the aerial photograph from 1940. This area was assessed in June 2023 and no evidence of impacted soils or non-native materials were encountered at the five test pits excavated.

Given the absence of visual soil impacts from the former well operations it was recommended that any potentially impacted soils remaining from past oil and gas production activities be addressed during construction by implementation of the directives listed in this SMP. Potential environmental conditions include TPH impacted soils from earthen sumps or mud pits, pipelines, or past spills/leaks. If TPH impacts are discovered, other chemicals of concern may include volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and heavy metals. TPH and VOC-contaminated soil, particularly those associated with crude oil, may be identified by the visual presence of dark gray or black staining and/or odor.

3.1 METHODS OF EXPOSURE

The primary mode of transport of potentially impacted soil is through earth-moving operations during grading. The main human health concern at the Property in such instances would be through the direct exposure to TPH- and VOC-impacted soil by ingestion, inhalation, and/or dermal contact. Activities that involve the handling of impacted soil, such as any improvements that involve excavation/grading work, may result in exposure to hydrocarbon or VOC-impacted soil. Inhalation of airborne dust is another route for exposure to TPH and VOCs. Therefore, procedures should be put in place to minimize dust generation and migration during excavation/grading activities (see Section 4.5). Additionally, vapor monitoring should be performed using a handheld photoionization detector (PID) if evidence of impacted soil is encountered – in order to evaluate whether additional safety measures are required such as use of a respirator or pressurized equipment cabs to limit inhalation of chemicals of concern (see Section 4.2.1.2).

SOIL MANAGEMENT PLAN

Soil Management

4.0 SOIL MANAGEMENT

This SMP was prepared to describe the management protocols recommended for handling, moving, stockpiling, and disposing of soil from areas of the Property where earth movement is anticipated. This SMP is designed to account for the possibility that impacted soil could be encountered during land clearing and grading, as well as requirements for any soil to be imported to the Property. If previously unidentified soils are encountered at the Property during redevelopment that exhibit evidence of chemical impacts, proposed soil mitigation measures would consist of the removal of the impacted soils if chemical concentrations are evaluated and confirmed to exceed commercial screening criteria. "Impacted" soil would be defined as soil containing concentrations of hazardous substances or petroleum products above *commercial* screening levels set forth by the applicable regulatory agency, *i.e.* the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board, or county local oversight program.

Construction, utility, and landscape workers may disturb the subsurface through digging, grading, trenching and/or excavation in the soil at the Property and, therefore, may encounter previously unknown structures or areas of impacted soil. During construction activities, workers who may directly contact impacted soil will conduct the work in accordance with Occupational Safety and Health Administration (OSHA) training and worker protection rules and regulations and their company's Health & Safety procedures; at a minimum the company Health & Safety procedures must meet all the minimum requirements of all applicable OSHA requirements.

The information provided in this SMP will be used to address proper handling, assessment, and disposal of any impacted soil or subsurface features that are encountered during grading. All soil that will be transported offsite must be adequately characterized and disposed at a facility that is permitted and approved by the disposal contractor to receive such material. Likewise, any soil imported to the Property must be either from a virgin quarry, or certified or determined by analysis to be "clean" in accordance with applicable state standards prior to arriving at the Property.

Any soil imported to the Property from an offsite source should be sampled for potential chemical impacts based on the former and/or current usage of the source site. Such sampling activities should be conducted at the import site (*i.e.* before importing it to the Property).

4.1 POTENTIAL SOIL DISTURBANCE ACTIVITIES

Activities that may cause soil disturbance and uncover potential SMA(s) include site grading; grubbing; removal of soil; removing/installing underground utilities and utility pipeline repair activities; planting trees/landscaping; installing foundations/piles; excavation of stormwater retention ponds; and performing any other construction activities that extend below the existing grade of the Property. When these or any other subsurface activities are performed, this SMP will be followed. All personnel on the project that would be used to assess potential soil contamination and/or remediate confirmed soil contamination

SOIL MANAGEMENT PLAN

Soil Management

should have the proper Cal-OSHA 40-hour Hazardous Waste Operator (HAZWOPER) training current to the date of the operations when handling materials in designated SMAs.

4.2 CONTINGENCY PROCEDURES

The following contingency procedures will be followed upon discovery of features that are potentially a source of contamination (such as unknown USTs, stained soil, buried drums, oil pipelines, clarifiers, burial pits, etc.) or contaminated soil. Example photographs of such potential contaminant sources that could be encountered on former oil field sites are included in **Appendix B**.

Below are the procedures that will be followed for suspending excavation/grading work, transferring any materials, and notifying applicable local, State and/or Federal agencies. Additionally, these contingency procedures would apply if stained surface soils surrounding the previously identified well pumps (Section 2.2) cannot be avoided during construction and earthmoving work is required at those locations.

The contingency procedures include the following:

- If an underground tank, previously unidentified structural source (*e.g.*, clarifier, sump, drum, oil pipelines, burial pit, etc.), or potentially contaminated soil is found during construction, grading, or excavation, activities will be suspended within 50 feet of the area of concern until an evaluation, appropriate permitting, and/or sampling can be performed. Any subsurface structure or potentially contaminated soil encountered should not be removed or graded through.
- Sampling will be performed on the material, soil, and surrounding soils, etc., as necessary to evaluate the nature of the material and proper disposal method. The appropriate chemical analysis will be performed by the environmental professional consistent with the concern identified.
- Identification of unknown or unexpected conditions will be promptly communicated by telephone to the Client. If soil contamination is confirmed through sampling activities the area will be deemed a SMA. Reportable quantities of petroleum product or hazardous substances in soil, may require notification to the applicable regulatory agency (*i.e.* DTSC, regional water quality control board, or local oversight program). Similarly, underground storage tanks (registered or unregistered) would require notification to the Fresno County Environmental Health (FCEH).
- Once any required permitting is secured and the SMA is characterized, the structures and/or impacted soil will be excavated and stored/stockpiled onsite on plastic for further waste profiling characterization as discussed in Section 4.3.
- Confirmation sampling within the resulting excavation should be performed as discussed in Section 4.2.2.
- Excavated soils will be separately stockpiled and profiled for waste characterization purposes as described in Section 4.3. Confirmation sampling within the SMA, following excavation will be performed according to the steps outline in Section 4.2.2.

The following subsections describe the procedures that will be implemented during assessment and removal activities.

SOIL MANAGEMENT PLAN

Soil Management

4.2.1 Soil Screening Methods

Visual, olfactory, and instrument-based soil screening will be performed by the on-site environmental professional if any potential SMAs are encountered. Based on sampling data and in-field screening results, soil will be segregated into piles that require off-site disposal and material that can be used as unrestricted fill.

4.2.1.1 Air Monitoring

Benzene, ethylbenzene, tetrachloroethylene (PCE), trichloroethylene (TCE) and 1,2,4-trichloroethene are examples of VOCs that will register on a handheld PID in real time. If SMAs are encountered during grading, Stantec recommends periodic air monitoring to evaluate whether any detected levels of VOCs show a significant increase over background levels. Air monitoring should follow the screening levels and responses summarized in Appendix A, Potential Airborne Concern and Air Monitoring Action Level Table.

4.2.1.2 Respiratory Protection

In the event SMAs are encountered and air monitoring indicates that concentrations are above the action levels listed in Appendix A, respiratory protection (via a respirator or pressurized equipment cabins) should be used for the duration of elevated PID readings. All staff present on the project should have available properly-fitted respirators for use, if needed. The respirators should contain the appropriate filter cartridges and be recently tested to ensure effectiveness.

If pressurized cabins are to be used by earthwork machinery, it is necessary to maintain the necessary training listed above for work in the impacted zones. Operators should have appropriate respirators with them at all times should it be necessary to exit the equipment cabs during a time period when vapor concentrations exceed levels of concern listed above.

4.2.2 Soil Sampling

At a minimum, soil samples collected during the assessment of potentially impacted soils should be analyzed as follows:

- TPH by EPA Method 8015;
- VOCs by EPA Method 8260b;
- Title 22 metals by EPA Method 6010b/7471A

Based on the results, particularly in the case of elevated TPH concentrations related to oil well drilling, additional analysis may be necessary to further evaluate for the presence of SVOCs or polycyclic aromatic hydrocarbons (PAHs). Soil samples will be collected and delivered to an offsite laboratory for 24-hour analysis.

If the results of soil sampling indicate that remediation through excavation and disposal is necessary, the Client will be informed of the planned soil removal. Following excavation and disposal of any impacted

soil, confirmation samples will be collected within the excavation on 25-foot centers from both the bottom and sidewalls of an excavation per typical regulatory requirements. The analytical results will be compared to applicable commercial cleanup thresholds, i.e. DTSC Screening Levels (DTSC-SLs), USEPA Regional Screening Levels (RSLs), RWQCB Environmental Screening Levels – Direct Exposure that were used for comparison purposes during the assessment work performed at the Property for commercial land use. These thresholds include the following:

- Total Petroleum Hydrocarbons (TPH) consistent with the 2019 San Francisco Bay Regional Water Quality Control Board Residential Use Environmental Screening Levels (ESLs) – Direct Exposure, which are as follows:
 - o Gasoline Range Organics (GRO): less than 2,000 mg/kg.
 - o Diesel Range Organics (DRO): less than 1,200 mg/lg
 - o Oil Range Organics (ORO): less than 180,000 mg/kg
- VOCs, metals, or other potential contaminants of concern: The more conservative commercial threshold between the DTSC Note 3 and US EPA Regional Screening Levels documents. With regard to arsenic, the upper-bound background concentration of 12 mg/kg will be used as a cleanup goal (*Determination of a Southern California Regional Background Arsenic Concentration in Soil*, DTSC 2008).

4.3 STOCKPILE MANAGEMENT

If soil stockpiles are created during Property construction activities, they must be managed in accordance with the Project's Stormwater Pollution Prevention Plan (SWPPP) and appropriate erosion and sediment control measures. All soil stockpiled at the Property will be lightly sprayed with water as needed to minimize the potential for fugitive dust and will be covered with high grade plastic sheeting (*i.e.*, 6 milli-inch) when not in active use.

All stockpiled soil planned for disposal will be stockpiled separately in a designated area, on high grade plastic sheeting, and adequately characterized/profiled to ensure proper management and disposal using standard US EPA testing methods. Stockpiled soil that is to be disposed of will be sampled according to the requirements of the licensed waste disposal facility potentially receiving the material. Samples will be submitted to a laboratory certified to perform hazardous waste testing.

An approved manifest system be used to track waste streams from generation to disposal. Manifests will comply with all provisions of appropriate transportation and disposal regulations. Appropriate measures and practices will be employed to prevent spills or leaks of materials from occurring at the Property or en-route to the designated facility.

4.3.1 Stockpile Soil Sampling

Soil samples from waste soil stockpiles should be submitted for laboratory analysis to profile the soil for off-site disposal. Soils classified as potentially impacted should be sampled in accordance with the receiving waste facility's requirements which will likely include 4-point composite samples for analysis of

SOIL MANAGEMENT PLAN

Soil Management

TPH, VOCs, metals, and pesticides. Soil sample collection depths within the soil stockpile should be collected at depths greater than 12 inches from the exposed stockpile surface.

4.4 TRANSPORTATION

Potential transport of soil will be performed by properly licensed and permitted haulers in accordance with appropriate local, state and federal regulations. Loaded transport vehicles leaving the Property will be appropriately lined, securely covered, cleaned, manifested and placarded in accordance with appropriate local, state and federal requirements.

4.5 DUST CONTROL

During soil grading and excavation activities, the contractor will use control measures for fugitive dust and odor in accordance with San Joaquin Valley Air Pollution Control District Rule 8021. Dust and odor control measures will be used such that no visible dust migration or offensive odors are observed. Typically, misting with water can be used to control dust emissions and odors, or temporary suspension of work, to allow odors to dissipate. OSHA worker safety requirements shall be followed.

In the event that impacted soil is encountered, it will be separately stockpiled. Additionally, impacted soil must not be disturbed if winds exceed 15 miles per hour (mph) continuously. Any impacted stockpiled soils must be covered with heavy grade plastic sheets while water suppression is not employed, particularly during non-working hours. Additional control measures, if necessary, include the following:

- All active construction areas shall be watered at least twice daily or as necessary to prevent visible dust plumes from migrating outside Property limits;
- Water should be misted or sprayed while loading transportation vehicles;
- Drop heights should be minimized while loading transportation vehicles;
- Covers such as tarpaulins should be used for trucks carrying soils, if traveling on public roadways;
- Access roads, parking areas, and staging areas should be paved, watered or covered with non-toxic soil stabilizers and swept daily, as needed; and
- Streets should be swept daily if visible soil material is carried onto public roadways from the Property.

In the event that chemically impacted soil is encountered at the Property, monitoring and control of off-site fugitive dust emissions containing toxic air contaminants will be conducted.

4.6 DISPOSAL FACILITIES

Soil transported off-site must be disposed at facilities that are pre-authorized by Stantec, or the selected environmental consultant, and permitted by the applicable regulatory authorities to receive such material. If removed materials are significantly more contaminated, an alternative facility would be determined based on stockpile profiling results.

SOIL MANAGEMENT PLAN

Abandoned Oil Wells

5.0 ABANDONED OIL WELLS

There are seven (7) abandoned oil wells located at the Property that have been physically located, surveyed, and included on site development plans. The coordinates, casing diameters, and depth below existing ground surface are included in the table presented in Section 2.3. In the event that these oil well casings are encountered during construction activities, the well casing should not be altered/modified or cut to adjust its elevation. Any modifications or alterations performed on the well casing could prompt requirements from CalGEM to become the operator of the well and incurred costs to make such alterations or adjustments. Depending on the well condition and the past abandonment methods, such alterations or modifications could lead to requirements for re-abandoning the wells. Therefore, avoidance measures for these well casings is crucial. An example of what an abandoned well casing is provided in the **Appendix B**, Example Photographs.

SOIL MANAGEMENT PLAN

Health and Safety

6.0 HEALTH AND SAFETY

All work shall be performed in accordance with all applicable OSHA standards as a minimum. Based on the known contaminant concentrations, site workers will wear the appropriate level of Personal Protective Equipment (PPE), as described in the Project Health & Safety Plan and in accordance the prime GC policies and procedures. Levels of PPE should be reconsidered and modified depending on the conditions encountered as the project progresses. The GC is responsible for workers adhering to all applicable OSHA requirements at a minimum and all the Health & Safety policies and procedures.

The designated project superintendent chosen by the selected contractor will serve as the Project Safety Officer (SSO) or designate the SSO. Stantec will assist the SSO in areas where they are unfamiliar with Property safety. The job of the SSO will be to monitor dust control and ensure that the Property is only accessed by authorized personnel. In the event of an emergency, the SSO will have the authority to shut down Property activities and the knowledge to notify the appropriate emergency responders.

6.1 EMERGENCY PLANNING

Petroleum hydrocarbons and some VOCs are flammable at high concentrations. In the event of an emergency where Site activities are halted, necessary measures must be taken to ensure that contaminated soil does not leave the Site and that all stockpiles are covered when not in use.

In the event of an emergency, the SSO must notify the following agencies or individuals:

- Fresno County Fire Protection District: 911, or 559-493-4300;
- Fresno County Environmental Health Division: (559) 600-3357; and,
- San Joaquin Valley Air Pollution Control District: (559) 230-6000.

- The Level for Respirator Use is the concentration at which a respirator will be put on; it does not require the job to stop. The respirator is a tool to be used while determining why the exposure has reached that concentration. Take action to reduce the concentration using engineering controls such as water mist, spray foam, plastic cover, etc.

SOIL MANAGEMENT PLAN

- The Level for Work Stoppage is the concentration at which work on the job will stop. Determine why exposures have reached that concentration and how they can be reduced. Site evacuation is not necessary at this level. Implement engineering controls to reduce the concentration, and then resume work.
- PIDs - Photoionization Detectors are used for general hydrocarbon monitoring; an example would be benzene, toluene, ethylbenzene, and xylene, common on gasoline station sites. The PID typically uses either a 10.6 eV lamp (responds to pentane and higher hydrocarbons), or 11.7 eV lamp (responds to ethane [weakly], propane and higher hydrocarbons) to ionize and detect the gas. The PID will measure hydrocarbons that are ionized, and therefore is a screening device, not a chemical-specific measurement instrument. Benzene Meter – RAE Systems UltraRAE 3000 PID/Benzene Monitor.
- Combustible Gas Meters – Measure 10% of the LEL or Lower Explosive Limit for the particular gas of concern – check the MSDS for the LEL. Combustible gas meters are usually equipped with an oxygen monitor measuring in % Oxygen. These meters are used in potentially explosive environments or where the PID measurement is at or above 100ppm. Example: Gasoline has an LEL of 1.7%. 1% = 10,000 PPM. LEL of 1.7% = 17,000 PPM and 10% of that is 1700 PPM.
- The Levels for Work Stoppage are based on measurements taken using PIDs calibrated with isobutylene; PIDs calibrated with gases other than isobutylene may have a different response factor.
- Action levels can be modified with particular knowledge of contaminants and site conditions.
