## Cofiring of Coal Fired Power Plants with Biomass

### **1. Introduction**

### **2. Market Potential for Fuel Switch in WECC and CA**

### **3. Cofiring Technology Overview**

### **4. Biomass Supply Chain**

### **5. Biomass Pelletizing and Torrefaction**

### **6. Preliminary Estimate of Potential Co-firing in WECC**

### **7. Issues and Challenges**

# Introduction

---

- Co-firing has been introduced for years but so far few incentives have been put in place for co-firing of biomass on a large scale
- New drivers make co-firing an attractive option to consider:
  - Renewable Portfolio Standards
  - Greenhouse Gas trading
  - Fuel Switching
  - Life-extension / repowering options
  - Cheaper (opportunity) fuels
  - RECs
  - Job creation

# WECC Coal-fired Capacity by Coal Type (Including California)

\*Anthracite Culm, Bituminous Gob, Fine Coal, Lignite Waste, Waste Coal

\*\*Coal-based solid fuel that has been processed by a coal synfuel plant, and coal-based fuels such as briquettes, pellets, or extrusions, which are formed from fresh or recycled coal and binding materials

Source: EIA, "Existing Generating Units in the United States by State, Company and Plant, 2007," January 2009.  
<http://www.eia.doe.gov/cneaf/electricity/epa/epat2p2.html>

## Assumptions

This analysis only included coal-fired plants located in the United States. Those located in Canada and Mexico were excluded, although these facilities are eligible to meet California's RPS requirements, provided they deliver electricity into California. We also assumed that the entire states of Montana and New Mexico are in WECC, though small portions of these states fall outside WECC; likewise, South Dakota and Texas were fully excluded, though small portions of these states are located within WECC.

We excluded three facilities that are already engaging in co-firing by utilizing wood/wood waste as secondary fuels.

# Cofiring Market Potential

---

The research team analyzed the potential in GW using biomass as a fuel:

KEMA made two estimates of co-firing potential at coal-fired plants in the Western Electric Coordinating Council (WECC) region:

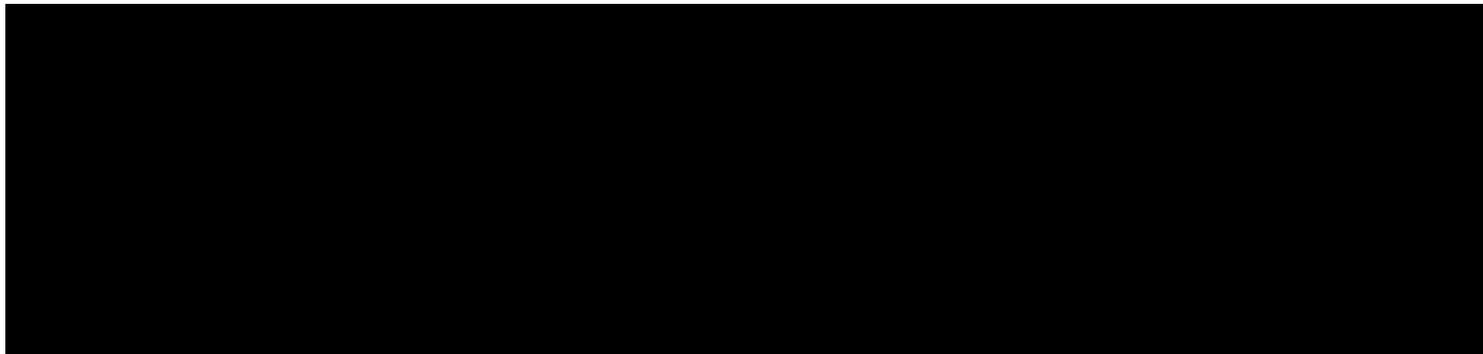

Low-cost co-firing – 1.5% of coal generation

High-cost co-firing – 10% of coal generation (this percentage can be increased to typically 30%)

Low-cost co-firing applications are those in which plant operators simply mix biomass feedstocks with coal without modifying the boilers at the facility. The capital costs are simply those required to receive and handle the biomass fuel.

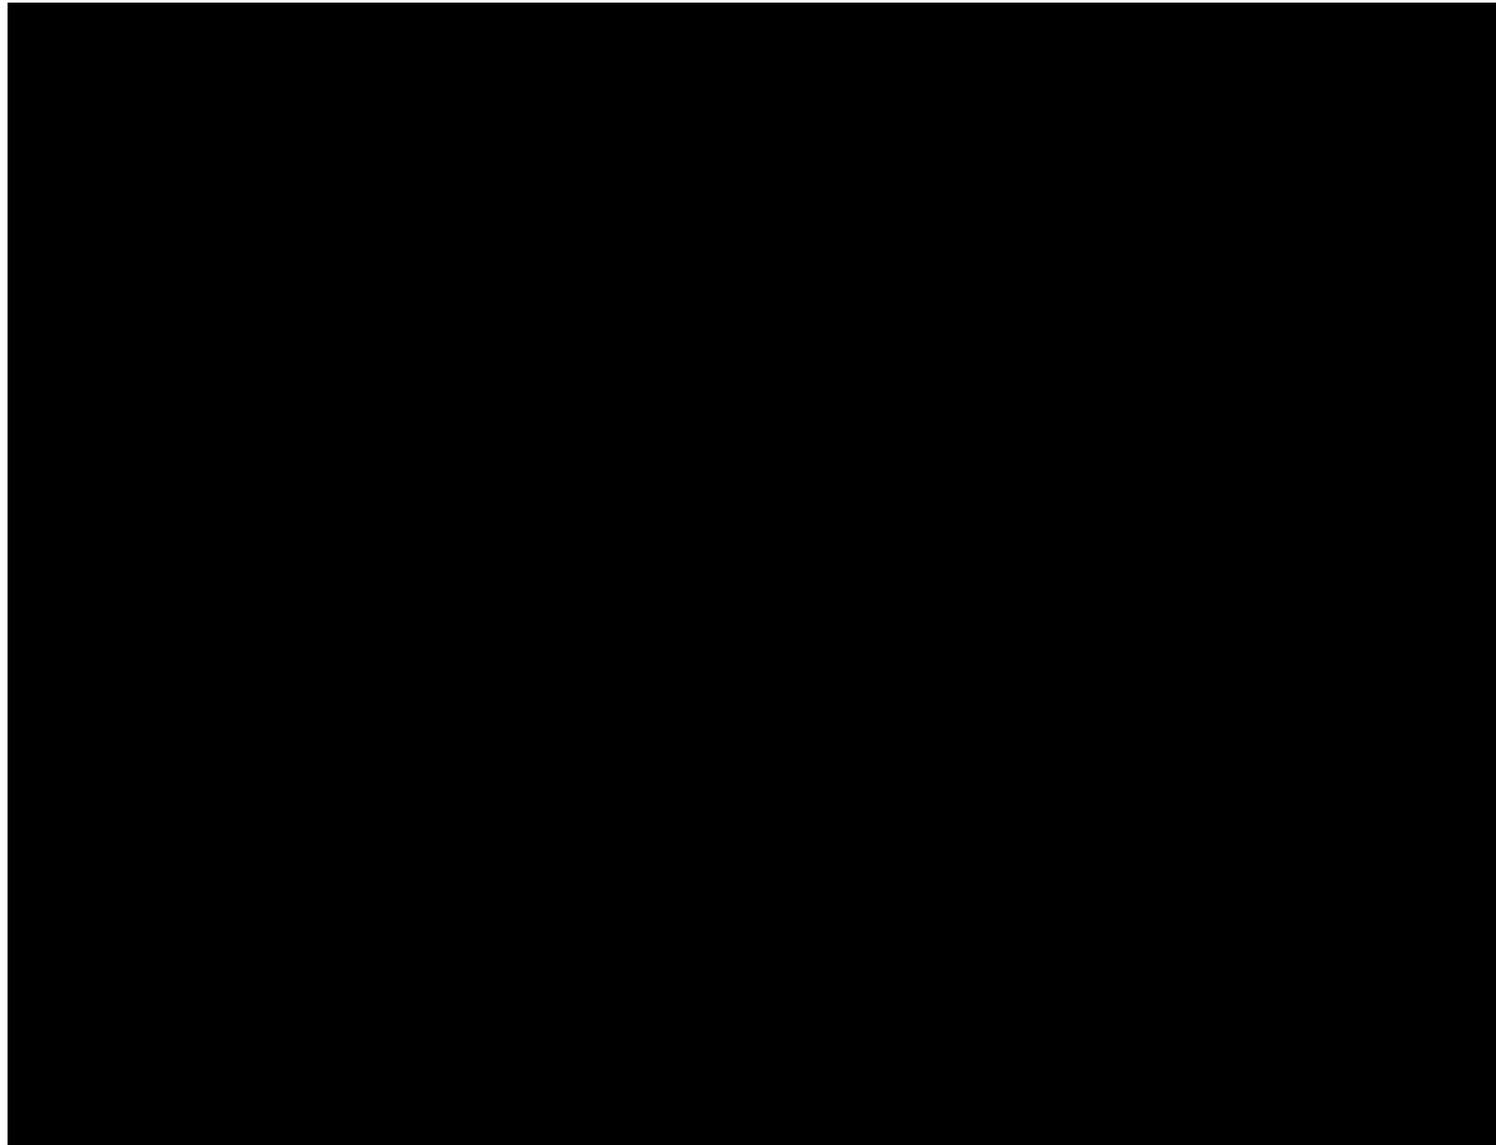

High-cost co-firing applications can require significant modifications and capital upgrades to boiler systems due to upgrades in fuel handling equipment and burners. These allow a far greater level of co-firing.

We have applied the same two coefficients (1.5 percent and 10 percent) to all facilities. If we had data on the specific types of boilers employed at each facility, we could conduct a more in-depth analysis with more specific co-firing coefficients for each boiler type.

# WECC Coal Based Generation Capacity (33GW / 225,574GWh)

(Source: EIA)

## CA Coal Based Generation Capacity (440MW, 2,895 GWh)

About 9,000 GWh of additional biomass/biogas needed to meet 20 percent of California's 33 percent by 2020 RPS goal

Plant Name	Nameplate Capacity (MW)	Summer Capacity (MW)	Net Generation (Annual GWh)	Capacity Factor	Co-firing (low)	Co-firing (high)	Co-firing (high)
					2%	10%	30%
ACE Cogeneration Facility	108	101	729	77%	15	73	219
Stockton Cogen	60	54	434	83%	9	43	130
Port of Stockton District Energy Fac	54	44	268	57%	5	27	80

**3. Cofiring Technology Overview**

**4. Biomass Supply Chain**

**5. Biomass Pelletizing and Torrefaction**

**6. Preliminary Estimate of Potential Co-firing in WECC**

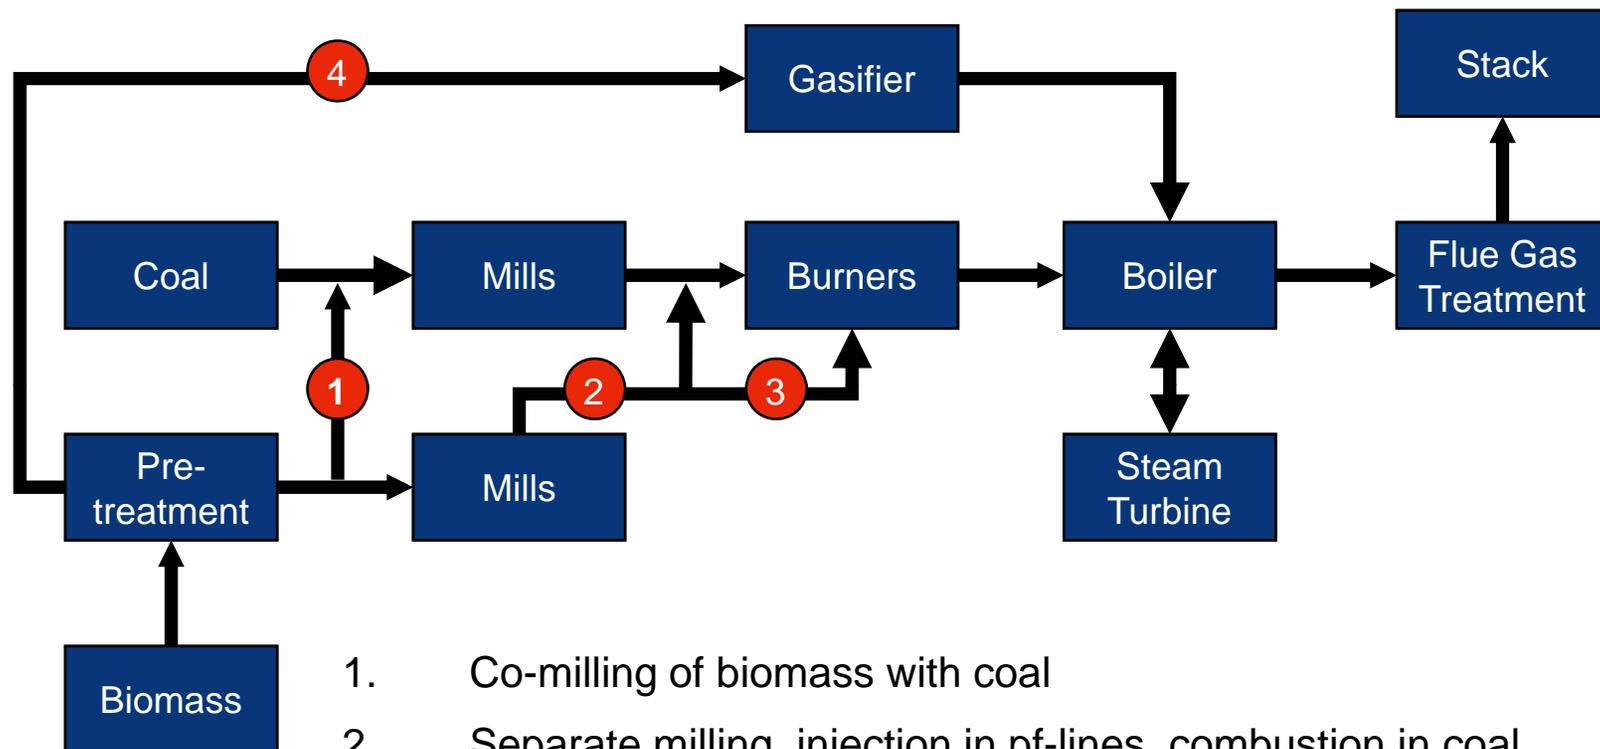

**7. Issues and Challenges**

# Technology Aspects

---

- Co-firing up to 30% is technically feasible without significant modification, with following considerations:
  - Enough biomass available
  - Suitable area for feedstock storage
  - Suitable area for pre-processing unit
  - No unit derating
  - No undue degradation of combustion properties
- Based on our modeling the most dominant economic parameters are:
  - The biomass price and current coal price
  - The specific investment costs and
  - The CO<sub>2</sub> price
- Examples of break even biomass prices seen from 1.7 to 2.1 US\$/MMBtu without consideration of RPS and Carbon allowance costs

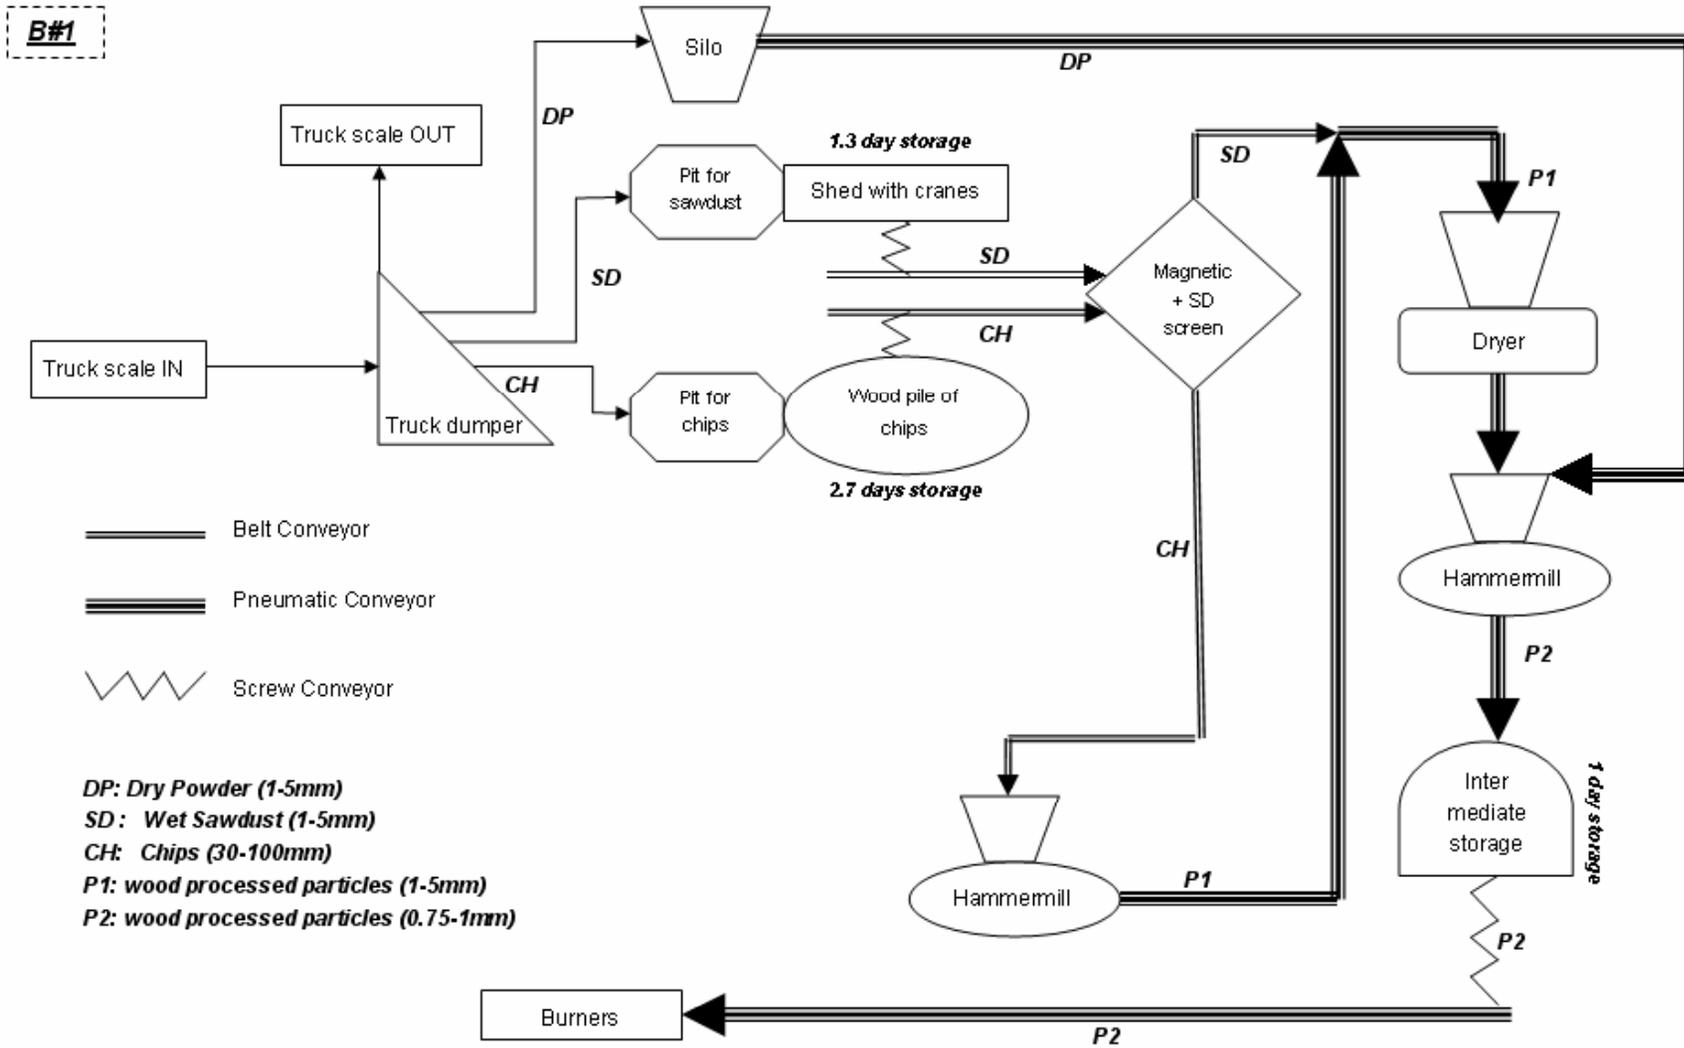

## There are four Biomass injection point possibilities

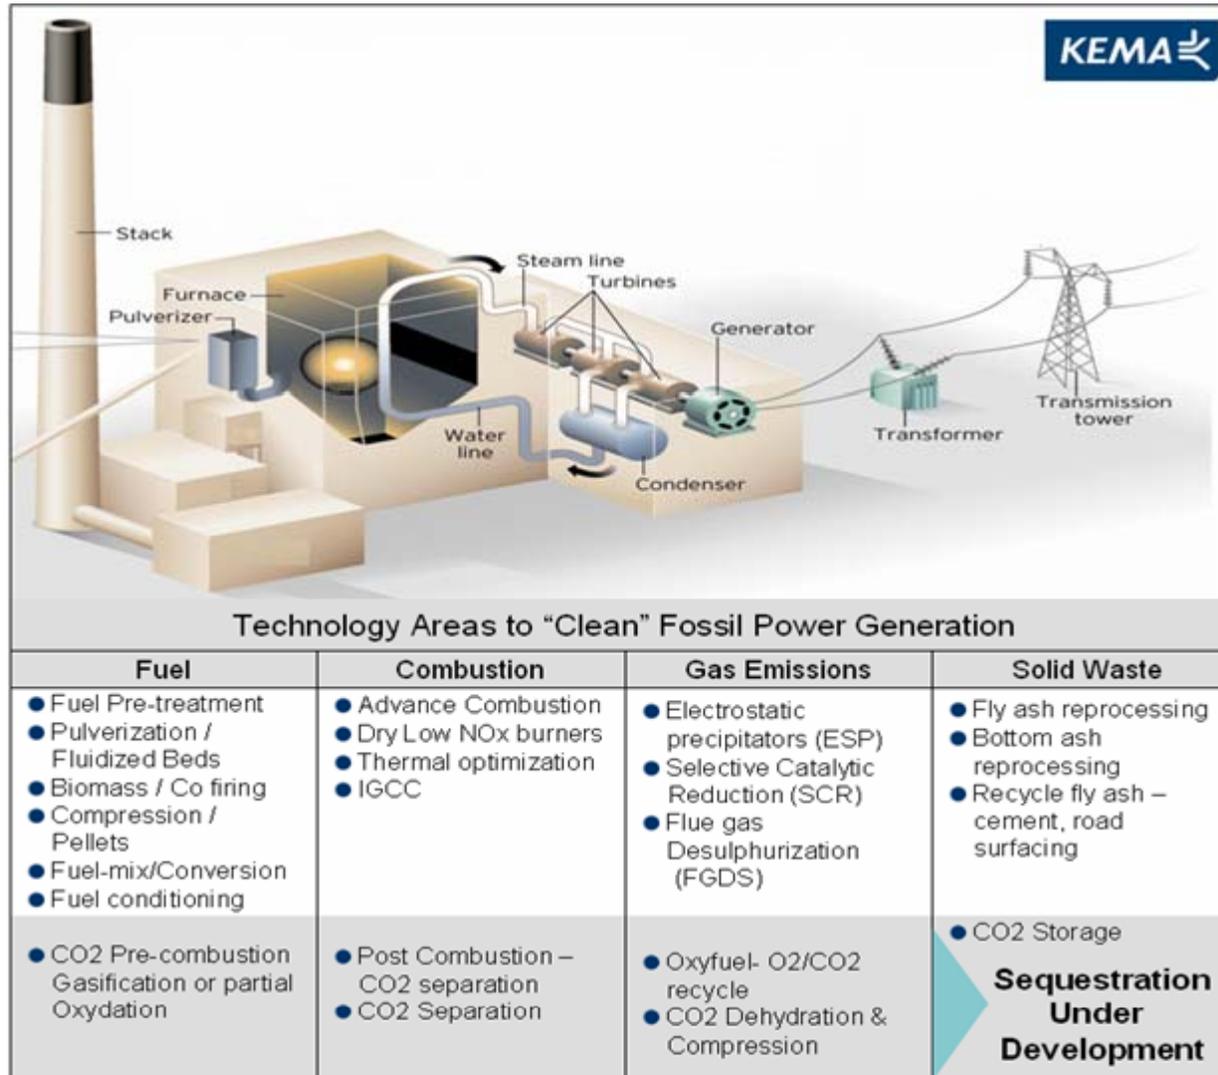

1. Co-milling of biomass with coal
2. Separate milling, injection in pf-lines, combustion in coal burners
3. Separate milling, combustion in dedicated biomass burners
4. Biomass gasification, syngas combusted in furnace boiler

Each co-firing route has its own (unique) operational requirements and constraints and specific demands on fuel quality

# Biomass Pelletizing and Torrefaction

---

Woody Biomass

Torrefied

Pelletized

Pelletized biomass is an efficient fuel source for heating and energy generation, and is now being utilized in Europe and the eastern US.

# Torrefaction

---

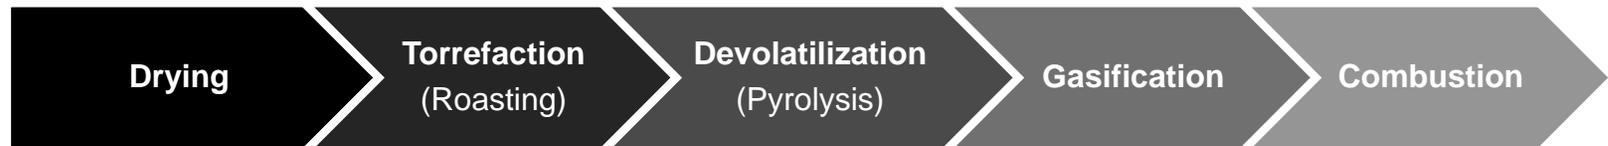

Torrefaction = Roasting

Every morning millions of people drink coffee, made from roasted coffee beans....

Fibrous Biomass can be torrefied in a similar fashion

Pulverized,  
Torrefied Wood

Torrefied Wood Pellets  
“**Bio-Pellets**”

# Technology for Torrefaction of Wood Chips is available

- Capacity: 60,000 tonnes / year
- Design for Polow Energy Systems in Netherlands
- Construction start scheduled for 2009
- Product destined for power plant in Germany
- Wood Chips Feed Moisture: 40%
- Modular plants sited in biomass rich areas can process feedstock for efficient rail transport

## Preliminary Estimate of Potential Co-firing in WECC (Co-firing Biomass in Coal Power Plant Units)

---

- Total biomass potential in WECC is approx 33GW
- Based on existing assets with 100% biomass firing:
  - Approx 10 GW of coal units in WECC areas
  - Approx 0.5GW of coal units generate in CA
- Based on conservative 10% to 30% cofiring of these plants:
  - Between 1GW to 3 GW of Biomass power could be generated (replacing coal)
- Estimates assume biomass feedstock is readily available.

## Coal-fired Power Plants in WECC (Out-of-State) Contracting with California Utilities

Plant Name <sup>1</sup>	State	Nameplate Capacity (MW) <sup>2</sup>	Summer Capacity (MW) <sup>2</sup>	2006 Claims (GWh) <sup>1</sup>

## Issues and Challenges

---

- Maximize the job creation by building a supply chain
  - Infrastructure for biomass transportation
  - Construct torrefaction and pelletizing facilities
- Operators challenge and incentives to implementation
- Torrefaction and air quality issues
  - Extract potential for low NO<sub>x</sub> and SO<sub>x</sub> from biomass firing
  - Fouling of SCR with biomass flue gas constituents

# End

## Questions and Discussion
