## **Loss of Offsite Power**

Given that the purpose of this facility is to provide grid stability, what happens to this facility if the external grid is deenergized as a result of a large earthquake and there is NO power to the grid? What happens to this facility? How long can HVAC and other facility equipment be safely operated? What is the plan to maintain the facility in its shutdown state on a short-term and long-term basis? Is external power required for these scenarios? What happens when network connectivity is not possible using 'normal' means?
