San Juan Capistrano Lithium Battery Bank Plant

Hi,

My name is Brian Siwecki and I currently reside in the community above the vegetated hillside of the proposed lithium power bank facility in San Juan Capistrano. As a native growing up in Laguna Niguel and formerly served as a emergency management intern for the City of Laguna Niguel, there are many hazardous attributes associated with the proposed placement of the lithium power bank facility along with the topography, ecosystem and human inhabited community nearby. Building this lithium power bank in an already high risk area susceptible to vegetated wildfires and landslides only contribute more to the problem. Not only

That, it would be very costly for tax payers as local government agencies will need to increase spending for preventive, emergency response and overhaul as well as insurances if a plant would to burn as exemplified at Moss Landing in early January 2025. There is too much risk involved and goes against the states goal of preserving our nature and safety of our community members.
