## **Dirty Air and GHG**

Thank you for the opportunity to comment on the Huntington Beach Energy Project.

Natural gas is not a "clean" fuel. 100% of its carbon goes into the atmosphere either as GHG or in some form of criteria pollutant that will cause ozone or particulate pollution. Unlike biomass, whose carbon is reabsorbed as feedstock crops regrow, the carbon dioxide from natural gas combustion stays in the atmosphere where it adds to climate change and climate destabilization.

Thank you,  
Charles M. Ashley
