Docket Number: 17-EPIC-01

Commercial / Industrial Sector Energy Intensity reduction through heat recovery methods and technologies

We suggest the California Energy Commission support research and demonstration projects targeting waste heat recovery for reducing primary energy demand in buildings and industrial processes.

The research would target both the methodologies (advanced pinch that can now address both energy and water use within C&I sites) and technologies, including heat pumps that can now run in a large range of temperatures and be coupled to medium temperature heat and cooling networks.
