DER Model: Value proposition for behind the meter energy storage,

Value proposition is critical for behind the meter energy storage. The value comes from how you reduce your energy bill and create beneficial co-products. Current models do not include higher value co-products. It is possible to use excess electricity to store in battery. In some cases, excess electricity can be used to co-produce H₂, RNG or chemicals- which are higher value than normal round trip battery storage. These should be included in the modeling.
