Docket 18-IEPR-03 Southern California Energy Reliability

Regarding 18-IEPR-03, I feel strongly that the SoCal Gas facility at Aliso Canyon is NOT needed for energy reliability. Other than "fake" releases claimed to be needed by them, we have gone through two summers and three winters without using the facility. There are numerous reports written on this subject, with alternatives of use.

The world is changing to these alternatives. The City of LA has declared new buses will not be gas but electric, and new forms of producing electricity are happening with solar and wind farms, new homes in 2020 to be built with solar.

Reliability also must include safety, and Aliso is not a safe healthy facility, not just due to continual off gassing, but the Santa Susanna fault line running through every well. The facility needs to be shut down immediately, as many residents and visitors are still getting sick, and no one is finding out why, no long term health study, no on going testing of air, water and soil. How can any facility be deemed necessary if people are forced to move away due to being so sick because of it? I was one of them, and I live now with very limited use of gas, only because I lost my career due to the illnesses living near Aliso, or I would be using no gas at all. Give solar incentives so that we can show gas is not needed for reliability, safety or long term energy needs. Please move forward in determining reliability, knowing so far we have made it happen without gas storage at Aliso Canyon.
