Concern

I understand the need to conserve water in the state. However, I don't believe it is a proper use of time/energy to try and regulate the performance of sprinkler heads. This is not going to save water, the heads don't turn themselves on/off. It is about watering schedules, and waste.

It is better served to require all new housing developments to include two water systems, one for potable water, and another for irrigation using reclaimed water. This will save a tremendous amount of water, much more than regulating sprinkler head performance, which is a huge waste of time and resources.

Regulate the amount of new water demand, by regulating the amount of new development or regulate the new development to adhere to energy saving methods.
