Guidelines?

Regarding the Food Production Investment Program, can one do something with the end product, to reduce the gross waste, thus reducing the dumping of food into landfills - reducing production of methane gasses and food waste, thus making the entire food service industry less wasteful and feeding people who need to be fed. There are many great models that could reduce food waste of every single restaurant, and grocery store, for useable food in every community possibly eliminating a chunk of poverty - food insecurity. How can we throw away less food? What methods can we do to substantially reduce. It seems this project wouldn't follow your guidelines that attack the frontline with automation, which is super, but is it efficient and doable? Can you advise if my Zero Food Waste project would qualify for a grant? Thank you so very much.
