Jumpstarting building electrification

The production of methane for utilities is dangerous to communities and natural ecosystems. The burning of methane, like any other fossil fuel, also contributes to climate change.

We can dramatically reduce demand for methane by electrifying our buildings. Then, as electric utilities increase their percentage of sustainable energy production, we can take full advantage of that rather than continuing to burn fossil fuels in our appliances.

Thus, I ask the Commission to please prioritize building decarbonization and identify more strategies that will jump start electrification. It will have a huge beneficial impact. Thank you.
