JOINT AGENCY WORKSHOP

CALIFORNIA ENERGY COMMISSION

1516 NINTH STREET

FIRST FLOOR, ART ROSENFELD HEARING ROOM

SACRAMENTO, CALIFORNIA

THURSDAY, JANUARY 17, 2019

10:00 A.M.

Reported by:

Susan Palmer

APPEARANCES

COMMISSIONERS

Robert B. Weisenmiller, Chair California Energy Commission, Lead Commissioner for Electricity and Natural Gas

Janea Scott, Lead Commissioner for 2019 IEPR and Transportation, California Energy Commission

J. Andrew McAllister, Lead Commissioner for Energy Efficiency, California Energy Commission

David Hochschild, Lead Commissioner for Renewables, California Energy Commission.

ENERGY COMMISSION STAFF

Heather Raitt, IEPR Program Manager

Chris Kavalec, California Energy Commission staff

Cary Garcia, California Energy Commission staff

MODERATORS

Jeffrey Michael, University of the Pacific

Louise Bedsworth, Strategic Growth Council

PANELISTS

Jerry Nickelsburg, UCLA Anderson Forecast

Irena Asmundson, California Department of Finance

Rachel Cortes, San Diego Association of Governments

Cynthia Kroll, Association of Bay Area Governments

Adam Kamins, Moody's Analytics (via WebEx)

Bob Raymer, California Building Industry Association

Tiffany Roberts, Western States Petroleum Association

Michael Shaw, California Manufacturers and Technology
Association

APPEARANCES

PANELISTS

Jeff Bellisario, Bay Area Council (via WebEx)

John Cho, Southern California Association of Governments

Tracy Egoscue, Port of Long Beach Commission

Cyndee Fang, San Diego Gas & Electric Company

Eduardo Martinez, Southern California Edison Company

Tim McRae, Silicon Valley Leadership Group

Karen Mills, California Farm Bureau

ALSO PRESENT

Andrea Bailey, California Energy Commission

Jesten Ruiz, California Energy Commission

Jasey Crosby, BBSW

Cameron Luther, REMI

Andrew Kosydar, CBIA

Tim Carmichael, Sempra Energy

Ken Schiermeyer, San Diego Gas and Electric

10:03 A.M.

SACRAMENTO, CALIFORNIA

THURSDAY, JANUARY 17, 2019

5 MS. RAITT: All right, good morning. I
6 think we're just about ready to go here. Welcome
7 to today's 2019 IEPR Lead Commissioner Workshop
8 on California's Economic and Demographic Outlook.
9 This is our first workshop for the 2019 IEPR.

10 I'm Heather Raitt. I'm the Program
11 Manager. I'll quickly go over our usual
12 housekeeping items.

13 Restrooms are out the -- across the hall
14 there. If we have an emergency and need to exit
15 the room, please follow staff out through the
16 doors and across the street to Roosevelt Park.

17 Our meeting today is being broadcast on
18 our WebEx conferencing system, so it's being
19 recorded, and we'll have a written transcript
20 posted in about a month. And we'll also have an
21 audio recording posted on our website.

22 There will be an opportunity for
23 questions at the end of each panel, so we'll
24 take -- if you have questions, we'll take them
25 first from folks in the room, and then from folks

1 on WebEx.

2 There will also be an opportunity at the
3 end of the day for public comment and those will
4 be three minutes, limited to three minutes. If
5 you do want to make public comments at the end of
6 the day, please fill out a blue card. They're at
7 the entrance. You can give it to me.

8 For folks on WebEx, you can use your
9 raise-your-hand feature that WebEx provides to
10 let our coordinator know that you wanted to make
11 a comment.

12 And then at the very end, we'll open up
13 the lines for the phone-in participants.

14 Materials for the meeting are at the
15 entrance to this hearing room, and also posted on
16 our website. The notice provides instructions
17 for submitting written comments and they're due
18 on January 31st.

19 And then just finally for our panelists,
20 I'd just like to thank you for being here. And
21 just remind you, we do have folks on WebEx, so if
22 you could try to remember to identify yourself
23 each time before you speak, that would be really
24 helpful.

25 And with that, I will turn it over to

1 Commissioners for opening remarks. Thank you.

2 CHAIR WEISENMILLER: Yeah. So this is
3 Chair Weisenmiller. Just a few comments.

4 I mean, first, for context, this is
5 actually part of the 2019 IEPR, if anyone is
6 confused. The 2018 IEPR will be up for adoption
7 soon. Commissioner Hochschild has been the lead
8 on that. The 2019 IEPR, which is the kickoff
9 one, Commissioner Scott will be the lead on that
10 one. So again, we haven't quite gotten one out
11 the door and we're starting on the next.

12 But you know, the economy is very
13 important to us in California. Certainly, trying
14 to understand the drivers there is one of the
15 things that really can influence our forecast.
16 And as we go through the forecast, this is one of
17 the first steps, is to try to look at the
18 economic and demographic outlook coming forward,
19 so I certainly appreciate you being here.

20 Our forecast drives a lot of the state
21 planning in the power sector, both at the CAISO
22 and the PUC. So again, it's really important
23 that you help us get this right. And at the same
24 time, it's important for us to, as I said, to
25 understand the economy so that we can try to

1 figure out ways to, again, keep driving that
2 engine of California's greatness.

3 COMMISSIONER SCOTT: Well, good morning
4 everyone. This is the 2019 IEPR, overlapping a
5 little bit with our 2018 IEPR. This is
6 Commissioner Janea Scott. I am delighted to be
7 the Lead on the 2019 IEPR. And I want to thank
8 everyone for being here with us today.

9 As Chair Weisenmiller mentioned, the
10 demand forecast is one of the core
11 responsibilities here at the Energy Commission
12 and it serves as an anchor to our IEPR process.
13 The forecast is used in a number of different
14 planning efforts, and so it's important for us to
15 make it as robust as possible.

16 Our staff have done a really great job of
17 continuing to develop and refine the forecast
18 over the years, keeping pace with emerging trends
19 and changing market forces. But as you all know,
20 California's quickly evolving energy economy
21 creates new challenges when developing a forecast
22 and makes it more important for all of us to be
23 leveraging the information that's available. So
24 workshops, like the one we're having today, help
25 provide an opportunity for us to get insight from

1 regional leaders with on-the-ground knowledge,
2 industry experts, business representatives, and
3 other stakeholders on how they see California's
4 economics, demographics and business climate
5 changing over time, all of which are critical
6 components to the development of the forecast.

7 And so with that, I'm glad to be here. I
8 look forward to today's discussion.

9 COMMISSIONER MCALLISTER: Yeah. Not too
10 much to add. I guess just -- sorry, this is
11 Commissioner Andrew McAllister. I'm taking --
12 well, this year, I'm happy to work with
13 Commissioner Scott on the IEPR, and particularly
14 focusing on the forecast and some of the long-
15 term challenges we face in updating the
16 technology related to the forecast or by which
17 the forecast is done, taking advantage of all the
18 modern amenities of lots of data and, you know,
19 the wide range of stakeholders to address,
20 really, the foundational needs of the challenges
21 we face going forward for the next, you know, 20,
22 30 years.

23 So the forecast is the foundation, as
24 Janea just said. And we need to kind of rise to
25 that challenge because things are getting more

1 disaggregated, they're getting more complex,
2 localized, lots of different questions that we're
3 going to need to ask and we have to have the
4 tools to answer. So not that the forecast is
5 going to be the solution to all of those
6 questions but I think it's a foundational tool
7 that helps us organize our thoughts and dig in,
8 in specific areas where we need to.

9 So the economic demo is really critical.
10 And I think if we look at -- as we try to
11 understand where the economy is and where it's
12 headed, particularly in the near term, there's a
13 lot of question about, you know, when the next
14 recession is coming, when -- you know, what the
15 near immediate term actual looks like?

16 So hopefully our discussion can shed some
17 light on how we talk about that and give us the
18 latest information about how we can anticipate
19 all different scenarios. And so I'm looking
20 forward to today and future IEPR workshops.

21 COMMISSIONER HOCHSCHILD: Well, welcome,
22 friends, and good morning. David Hochschild
23 here. My thanks to Heather and the whole IEPR
24 Team. It's a little bit like painting the Golden
25 Gate Bridge; as soon as you finish one IEPR, you

1 start over again.

2 So obviously, our economy in California
3 has been significantly outperforming the U.S.
4 economy. GDP in California has grown 46 percent
5 since 2000, versus 35 percent growth for the
6 other 49 states. And you know, whether this will
7 continue and what happens to the national economy
8 is an open question.

9 So thanks to you all for being here and I
10 look forward to getting into these issues today.

11 MS. RAITT: Great. Thanks. So this is
12 Heather Raitt again. And first we'll have a
13 presentation from Cary Garcia on the California
14 Economy and Energy.

15 MR. GARCIA: All right. Thank you and
16 good morning. I like the Golden Gate Bridge
17 analogy. I think that suits very well. I'm
18 looking at the forecast schedule for next year
19 already today.

20 So I'm Cary Garcia. I'll be coordinating
21 the demand forecast for this year's IEPR.

22 And so the first thing, I think the
23 Commissioners really touched on it, economic
24 activity is really a key driver for our demand
25 forecast. Looking at just some quick graphics of

1 electricity consumption and just to give some
2 background, so the way we develop our forecast,
3 we try to model on the way the consumer is
4 behaving. So rather than looking at just energy
5 sales, we go back, take the self-generation,
6 typically from PV and other sources, and
7 reconstitute what consumption would be and use
8 that to develop our projections, and then take
9 off all the developed sales based on the PV and
10 add the other modifiers, like electric vehicles
11 and whatnot.

12 So just looking at this graph here of
13 consumption that we use, you can see it tracks
14 pretty well with per capita income. It's
15 obviously a key driver there, particularly in the
16 residential sector.

17 Once again, looking at employment, you
18 see a very clear trend with electricity
19 consumption, as well. So that, once again, is
20 just a really important key driver for us, just
21 rehashing that the economy is very key to a
22 robust forecast, as the Commissioners mentioned.

23 And so just kind of repeating what I
24 said, reiterating this, you know, it's a key
25 driver for energy consumption. And then as the

1 Commissioners mentioned, you know, getting a good
2 sense of where those demographic shifts are going
3 to be really important, and particularly those
4 regional differences because we have a pretty
5 disaggregated forecast we have developed over
6 time and we may go down even deeper, depending on
7 the needs in the future.

8 And I also want to mention that these
9 economic conditions also affect our other parts
10 of our forecast, particularly forecasting fuel
11 demand which has impacts on the adoption of
12 electric vehicles. And then now, as we're moving
13 towards a decarbonized future, this tradeoff
14 between natural gas and electricity demand is
15 going to be more important to understand, as
16 well. And I imagine the economy is going to be a
17 driver there in those tradeoffs.

18 So just to give some -- a little
19 background as we have this conversation, this is
20 a map of the forecasting zones that we have in
21 our demand forecast, so we've organized these by
22 planning areas which are typically developed
23 around our utility planning areas.

24 So items one through -- or Zones 1
25 through 6 represent the PG&E planning area; 7

1 through 11 will be the Southern California Edison
2 planning area; San Diego has their own -- San
3 Diego Gas and Electric has their own as Forecast
4 Zone 12; and then 13, 14, 15 represent the
5 Balancing Authority of Northern California which
6 includes SMUD, as well as the components that
7 aren't in there in that Balancing Authority,
8 which would be the Turlock -- or, sorry, Trinity
9 Public Utility District and other entities; 16
10 and 17 is L.A., disaggregated by an inland and a
11 coastal region; and then we have Burbank,
12 Glendale, Imperial Valley, Imperial Irrigation,
13 as well as Valley Electric Association over there
14 on the border of Nevada.

15 So this gives you a sense of the
16 disaggregation that we're working with right now.
17 Most of our economic data is based around county
18 information and we kind of aggregate that out to
19 represent our planning areas, as well as our
20 forecasting zones.

21 And these are just some graphs I put
22 together real quickly. I think many of us are
23 Californians, but maybe for the ones that don't,
24 we have a pretty diverse state, and you can see
25 some distinctions here across our counties. You

1 can notice here in the Central Valley region in
2 particular, you see high rates of unemployment in
3 comparison the coastal regions. You even see
4 higher unemployment in those more northern
5 regions that we have, more northern counties.

6 One thing I wanted to point out here is
7 that you see my scale of two percent to eight
8 percent. When I was just developing this graph,
9 actually, Imperial County has significantly high
10 unemployment, around 18 to 19 percent, and so I
11 was struggling with that when I was developing
12 this graph; everything looked just a flat blue.
13 I was like, that can't be right, there has to be
14 some distinction, so I made some adjustments
15 there. But just a mental note for me and a note
16 for all of you here that the eight percent
17 doesn't represent Imperial County.

18 Once again, looking at some of the other
19 geographic distinctions that we have, this is
20 population growth in the state. So you'll see in
21 those northern regions, in the Sierra Nevada
22 regions, there's definitely a decline in
23 population relative to the inland areas. And
24 then looking at household growth you also see
25 that there's a similar sort of trend going on

1 there.

2 But one thing I wanted to point out, as
3 well, is you're looking at unemployment here, it
4 seems to be high in the Central Valley and those
5 inland regions, but yet those are the places
6 where you're seeing population grow, as well as
7 the household growth. So that's something to
8 think about as we have some of these
9 conversations today.

10 But I want to leave it at that. I just
11 wanted to be very brief and just reiterate the
12 importance of having, you know, good data.

13 And from the panels today, I would hope
14 that you can kind of put is in the right
15 direction on some areas we may need to take an
16 additional review of what may be some new drivers
17 that we should look at and what are some
18 additional ideas you may have, particularly
19 around understanding energy consumption in the
20 state?

21 And then lastly, I also want to thank
22 Nancy Tran. She was the lead for our Demand
23 Analysis Office to bring this together. So I
24 don't -- is she here? She's in the -- hiding in
25 the back, so I just want to recognize Nancy Tran

1 for the work she did to organize this.

2 So I'll leave it at that and let the
3 other panelists take over.

4 MS. RAITT: Thanks, Cary.

5 So this is Heather Raitt again. And our
6 first panel is on the California Economy Now and
7 in the Future. And the Moderator is Jeffrey
8 Michael from the University of the Pacific.

9 MR. MICHAEL: Great. Thank you. It's
10 terrific to be here again. I was here two years
11 ago, moderating this panel. I'm Jeffrey Michael,
12 Executive Director of the Center for Business and
13 Policy Research at the University of the Pacific,
14 Professor of Public Policy here at our McGeorge
15 School of Law in Sacramento.

16 I'm going to briefly introduce each of
17 our panelists, and then we'll just jump right
18 into the discussion.

19 So to my right is Irena Asmundson. She
20 is the Chief Economist for the Department of
21 Finance. I think your eighth -- or, sorry, fifth
22 year in that role, so she's been in that role for
23 five years, a lot of policy experience, Senior
24 Economist with the IMF, worked with the
25 President's Council of Economic Advisors in the

1 past. She has a PhD from Stanford, so we're
2 really pleased to have her here.

3 Rachel Cortes from the San Diego
4 Association of Governments. She is one of their
5 top tomographers there. So Dr. Cortes is an
6 expert in demography and statistical methods,
7 worked for the U.S. Census Bureau before coming
8 to the San Diego Association of Governments.

9 Next to Rachel is Cynthia Kroll, who is
10 Chief Economist at the Association of Bay Area
11 Governments, and the MTC, Metropolitan
12 Transportation Commission. So I've had a lot of
13 great conversations with Cynthia over the years.
14 She has her PhD in City and Regional Planning and
15 has been just a prominent economist and expert in
16 California and around the Bay Area for many, many
17 years.

18 To her right is Jerry Nickelsburg with
19 the UCLA Anderson Forecast. Jerry has been
20 leading the California forecast for over a
21 decade, is a really well-known figure in
22 forecasting throughout the state. And it's
23 always great to see Jerry. So, welcome, Jerry.

24 And then I believe on WebEx, we have,
25 just from Moody's Analytics, Adam. Are you

1 there? He's logging in? Okay.

2 So Laura Ratz was going to join us from
3 Moody's. Laura is, unfortunately, ill today, but
4 we're fortunate to have Adam Kamins or Commons
5 [sic] substituting this morning, pinch hitting
6 for Moody's where he's a Director, and he manages
7 the firm's U.S. subnational forecasting
8 processes.

9 And, Adam, are you logged in now? No?

10 I think we started a little bit ahead of
11 schedule, so Adam will join us in a moment, so
12 I'm just going to start off.

13 And, Adam, please let us know when you
14 join, so I can pull you into the conversation.

15 Two years ago I moderated this
16 conversation and, you know, we were on the brink
17 of a presidential inauguration in January 2017.
18 People were wondering, you know, about the
19 forecast? And you know, the consensus forecast
20 from our panel at that time, although I do recall
21 one person was very pessimistic in predicting a
22 recession, but sort of the consensus outlook was
23 actually very positive for the near term. The
24 fundamentals of the economy looked good, looked
25 pretty good, and that there was expectation that

1 the Trump administration was going to pour some
2 stimulus on to the economy in the near term, tax
3 cuts and deficit spending. And so anxiety, a lot
4 of people seemed to have anxiety, you know, in
5 the two- to four-year time range or concern about
6 what we could be looking at then.

7 So thinking back to that panel and now
8 recognizing that we're sitting two years from
9 that date, it is now that two year -- I'd point
10 out, I think the first part of that forecast
11 looked pretty good. And so what do you see now?

12 So I'm going to ask a few of our
13 panelists to give a short synopsis, maybe about
14 three minutes, of their current sort of macro, in
15 California, forecast. And I think I was going to
16 start with Adam, but I think he's still logging
17 in.

18 So maybe, Jerry, if you want to lead with
19 that?

20 MR. NICKELSBURG: So, let me, first off,
21 thank you for the -- ah, it's green. Thank you
22 for the invitation to be here once again.

23 Just one note. I have students at UCLA
24 who are waiting for me late this afternoon, so
25 I'm going to leave a little bit early, not too

1 much, but if I leave it's not because I'm bored,
2 it's because my students would like me to be
3 there in class.

4 So let me start with where we're at. The
5 fundamentals that gave us a two percent growth
6 rate in the U.S. economy in this expansion have
7 not gone away. The change in the tax law didn't
8 change that. So we had a stimulus that was put
9 on top of what was, certainly here in California,
10 a full employment or close to full employment
11 economy, and in many other parts of the country
12 where they saw significant economic growth, that
13 kind of pushed the economy into sub-four percent
14 unemployment. If you look at the Bay Area going
15 from Sonoma all the way to Santa Clara, you have
16 sub-three percent unemployment, and so that's
17 something that is not sustainable. We're
18 expecting to move back to a two percent economy.

19 But in that regard, one thing that the
20 new tax law did was it brought investment that
21 was going to occur this year and going to occur
22 in 2020 back into 2018 because there were
23 significant tax incentives to do that. And that
24 means that that investment won't be there this
25 year and next year. And our view is that that's

1 more impactful for 2020 than 2019, so we have a
2 growth rate of the U.S. economy that's one
3 percent in 2020 and the latter half of 2020 is
4 less than one percent. That could happen sooner
5 but that's our best view of that.

6 And just briefly, with regard to
7 California, it has been, as the Commissioner
8 pointed out, growing faster than the rest of the
9 U.S. We expect that to continue. Again, the
10 forces that have created that are still there.

11 MR. MICHAEL: Thanks Jerry. I think
12 there's a lot there that we can probe in more
13 depth in a few moments.

14 But I think now I'm going to ask Irena to
15 summarize the Department of Finance forecast.

16 MS. ASMUNDSON: Thank you. So in the
17 Department of Finance forecast, we have to assume
18 that we don't have a recession in our forecast.
19 And so I do want to warn everyone that that's why
20 we do the recession scenario because it's
21 probably inevitable, it's going to happen at some
22 point, we just can't know when.

23 So I did want to mention a couple of
24 things about our forecast that I do want you to
25 pay attention to that I think, probably, are

1 going to make a difference in how you think about
2 demand forecasting in the future. And to me,
3 everything comes back to housing.

4 So we do have employment growth. We do
5 have employment growth. We do have continued
6 income growth. We have not -- we do have
7 continued population growth, although population
8 growth is slowing and it appears that it is
9 slowing a little bit faster than what we'd
10 assumed. In the '80s, we had about a one percent
11 population growth every year. We think that that
12 might slow. It slowed to about .7 percent. Last
13 year was about .5 percent. That could, in fact,
14 be what we see in the future.

15 And a lot of this ties back to the
16 housing forecast. (Bumps microphone.) Sorry. A
17 lot of this ties back to the housing forecast in
18 that we are not building enough housing for our
19 population and we are not building enough housing
20 where the jobs are, which implies quite a lot
21 more commuting than what we would otherwise see.

22 And so if we are trying to figure out how
23 to bend this curve and go to a zero-net-carbon
24 economy by 2050 or something like that, then
25 there are quite a lot of changes that are going

1 to have to happen in the economy and in the
2 planning for California.

3 So kind of a word of caution in that,
4 yes, we have these trend analyses where our
5 trends continue, but in our planning, we are
6 increasingly thinking about how much higher
7 things could be or how much lower things could be
8 on various things.

9 MR. MICHAEL: So do you expect a higher
10 level of uncertainty then, if you're increasingly
11 thinking about --

12 MS. ASMUNDSON: Yes, usually more
13 uncertainty. And I think that it's worth trying
14 to put together scenarios about what kinds -- how
15 uncertainty could all fit together. So it's not
16 that for any indicator you have a rate of error,
17 it's that things could go in vastly different
18 directions and the policies have to fit together
19 in a particular way. So I think it's worth
20 thinking about that.

21 MR. MICHAEL: So, Adam, are you on the
22 line now? He is? No? All right. I got a
23 message that he was there but we can't hear him.

24 MS. RAITT: We can't hear him, so maybe
25 we should move on.

1 MR. MICHAEL: Well, we'll come back. I
2 want to pull him into this macro discussion.

3 But I think I might, at this point, just
4 ask for a little reaction to what we've heard so
5 far.

6 Cynthia or Rachel, is there -- as you
7 think about sort of this California macro
8 perspective, any observations?

9 DR. KROLL: It sounds like the California
10 I'm seeing, both the strength relative to the
11 country but the challenges in terms of things
12 like housing.

13 DR. CORTES: Yeah, just kind going off of
14 what Irena was saying about building kind of
15 scenarios around these different economic
16 outcomes, SanDAG, also, in our forecasts, we
17 don't forecast recessions, but I think everyone's
18 kind of waiting for it.

19 And kind of tying back to the big data
20 kind of discussion, I feel like today we have the
21 capability and capacity to run multiple scenarios
22 of growth and maybe decline that, I don't think,
23 at least at SanDAG, we were kind of able to do it
24 in the past. But it's something that we're
25 looking at, kind of how would these things change

1 and how can we take that forecast?

2 And the real tool is the next kind of
3 transportation-based modeling that we have to do
4 around it. And in the past, I don't think we
5 could have done all of that in one planning
6 cycle. And now we kind of have that capability
7 to look at those things and see how they're going
8 to affect San Diego in the future.

9 MR. MICHAEL: I want to come back to this
10 question of recession risk. And, hopefully, Adam
11 will be on the line in a moment.

12 And maybe ask, Jerry, I think you said in
13 2020, your baseline forecast is for a less than
14 one percent growth rate. It's getting awfully
15 close to recession.

16 I did an event about two weeks ago with
17 Scott Anderson, Chief Economist with Bank of the
18 West. His 2020 recession forecast was a little
19 bit over 50 percent two weeks ago.

20 You know, are you able to speak in
21 probabilities of what you think to be happening?

22 MR. NICKELSBURG: Sure. So we've all
23 said a few things about recession.

24 MR. MICHAEL: Um-hmm.

25 MR. NICKELSBURG: And so let me try and

1 frame that.

2 You know, recessions are about imbalances
3 in the economy. And what recessions do is
4 correct those imbalances by moving labor and
5 capital out of sectors that are weak and in
6 decline and into sectors that require them, or
7 breathing room if, for example, we have too much
8 housing, which we don't have now, for the
9 population to catch up.

10 But what you need for a recession is
11 something to trigger it, and so then you have
12 several sectors that are weak and the trigger
13 will cause them to simultaneously contract.
14 That's what a recession is.

15 When you look out two years in advance,
16 you know, trying to forecast a recession is
17 really something that the data don't admit
18 because you can't forecast these triggers that
19 far in advance. You can only indicate that
20 there's weakness that a trigger would create
21 that. And what kinds of triggers are we seeing
22 now, the kinds of things that we should be
23 looking at?

24 Well, one is disruption in trade flows.
25 You know, were that to occur, we have too much,

1 too many resources in trade and distribution and
2 not enough in manufacturing, and that would be
3 one additional weak sector which might drive us
4 into a recession. The current government
5 shutdown, if it goes on for long enough, that
6 could be a trigger that changes expectations. So
7 there are a number of things that could really
8 trigger this. The bond market is a place where
9 you find weakness today, as well, where imbalance
10 is, and potential weaknesses.

11 So I hesitate to give a probability of a
12 recession because of the real difficulty of
13 forecasting it. But the point I want to make is
14 look at what might trigger one, because we're
15 seeing the imbalances building up and 2019 and
16 2020 being times when the growth rate in our
17 economy is, you know, close enough to zero where
18 a trigger could actually create it.

19 MR. MICHAEL: Okay. So I'd love to get
20 Adam's perspective here. We're still working on
21 him, getting him on the line. Hopefully he'll be
22 here shortly.

23 But you know, we talk about triggers and
24 it, I mean, it seems like almost every morning,
25 you wake up and you see the news and something

1 happens and you wonder, is this the trigger,
2 whether that's globally or nationally? So you
3 know, discussions of trade flows in international
4 might be part of the trigger.

5 So the news this week was, you know,
6 collapse of the Brexit deal, something that adds
7 some instability into the global economy. Does
8 anyone have some thoughts on how that might
9 affect the outlook?

10 Irena?

11 MS. ASMUNDSON: So in our recession
12 scenario, we actually modeled a Fiscal Year 2019-
13 20 indicative scenario. I'm not saying that it's
14 going to happen but that's sort of how we modeled
15 it. And this year, the way we modeled the
16 trigger was that the stock market had been doing
17 really well up until about October, and a lot of
18 that was what a lot of economists are calling the
19 sugar high of tax cuts and a lot of money flowing
20 back to very wealthy individuals. At the same
21 time, interest rates were rising. Companies had
22 taken on quite a lot of debt because it was very
23 cheap to do so. And so one of the triggers we
24 thought through was that what would happen if
25 businesses and companies all of a sudden

1 realized, oh, consumers are not doing so well?

2 One of the things that we talk about is
3 that from -- in 2017 -- 2007, the median
4 household income in California was around
5 \$71,000. In 2017, the median household income
6 for California was around \$72,000 in inflation
7 adjusted numbers. They have barely done better
8 over ten years. The economy itself has done much
9 better.

10 And so a lot of people who look at
11 aggregates and look at these demand factors and
12 think that we should be doing so much better and
13 that companies should have so much more demand
14 and can take on debt to service all these
15 customers, there's a fundamental irrationality
16 there. And when they realize that consumers
17 aren't actually doing very well because they
18 haven't been given them wage increases for the
19 last ten years, that reckoning could be a
20 trigger.

21 MR. MICHAEL: Consumers is something we
22 haven't talked about too much to this point.

23 Adam, it sounds like you're on the line,
24 but let's --

25 MR. KAMINS: Yes. I apologize. Yeah,

1 technology is great until it isn't, but I'm here
2 now.

3 MR. MICHAEL: Adam, if you could -- so
4 I'm going to roll back just for a second and if
5 you could sort of give us a synopsis of the
6 Moody's forecast? And I don't know if you've
7 been listening to our discussion but we've been
8 talking about sort of recession probabilities and
9 what's the chance of that and where that might
10 come next, so --

11 MR. KAMINS: Sure. Yeah. No, I'm happy
12 to talk about that, and I did hear some of the
13 discussion.

14 So the economy at the moment, obviously,
15 things are looking very strong. Risks are
16 gathering but, you know, at the moment we don't
17 see any immediate risks that make us think that a
18 recession is in store in 2019. You know, the
19 economy is clicking on all cylinders for the most
20 part. You know, the unemployment rate is kind of
21 beyond full employment at this point.

22 Kind of the bigger dynamics that we're
23 concerned about at this stage in the cycle would
24 be kind of the fact that your inflationary
25 pressures should be starting to build. We're

1 seeing some evidence where, you know, wage growth
2 is picking up, for example, in a way that it
3 hadn't been for much of this cycle.

4 You know, that has compelled, I think, in
5 many ways the fed to begin to raise rates a
6 little bit more aggressively. But we saw, you
7 know, obviously, what the consequences of that
8 were back in December. And so our expectation
9 now is that they're going to take their foot off
10 the gas a little bit. And you know, the stock
11 market, in all likelihood, will probably
12 stabilize over the course of the next year. We
13 don't expect kind of a continued downward
14 trajectory.

15 So over the next year, I think we're in
16 reasonably good shape. But there are, obviously,
17 some major risks, but I'm sure we'll talk about
18 that as the sessions goes on, both, you know, the
19 trade war, the government shutdown, for example,
20 or you know, big kind of policy missteps that so
21 far have not taken down the economy in any
22 meaningful way. But you know, if we go kind of
23 in the continued wrong direction on policies
24 along those lines, that could have a real impact
25 in 2019.

1 So there are risks that I think are
2 becoming more pronounced. But our baseline
3 expectation is that, you know, as the stimulus
4 that first was associated with the tax cut last
5 year and that should come out of the fact that
6 there's increased federal spending this year,
7 that's kind of an asterisk there that, you know,
8 that increased federal spending is more than
9 offset if the government actually isn't
10 functioning, but if, you know, if kind of the
11 government reopened and you get kind of another
12 fiscal stimulus this year, I think that's enough
13 to keep things moving in the right direction on
14 2019.

15 But I think by the time you get to 2020
16 and, you know, our eyes have been for a while on
17 sort of mid-2020 as being kind of the most likely
18 spot where, you know, some of that stimulus
19 begins to wear off, bubbles begin to, you know,
20 emerge in the economy and then begin to rupture a
21 little bit, and I think that is sort of the most
22 likely point where you're going to see a little
23 bit of a reckoning.

24 So that's, yeah, I think low probability
25 in 2019 of recession but a fairly high

1 probability of one in 2020, 2021.

2 MR. MICHAEL: Brave enough to put a
3 number on that?

4 MR. KAMINS: Wow.

5 MR. MICHAEL: I'll let you off the hook
6 on that.

7 MR. KAMINS: I mean, I would say --

8 MR. MICHAEL: Go ahead.

9 MR. KAMINS: Yeah, I can be brave enough
10 to put a number but I'm chicken enough to use 50
11 percent; how about that?

12 MR. MICHAEL: All right. There we go.
13 That's one I've been hearing a lot lately, which
14 is certainly much higher than sort of that
15 baseline recession risk.

16 In a moment, my next question, I'm going
17 to ask a little bit about the government
18 shutdown, because I'm interested in what that
19 could lead to.

20 But I actually want to follow-up on
21 Irena's comment about consumers. We're talking a
22 lot about investment in the international economy
23 but consumers are about 70 percent of GDP. Irena
24 raised some concerns about consumers. And so I'd
25 like to ask you just a moment about your outlook

1 for consumption in household spending.

2 MR. KAMINS: Yeah. I mean, in the short
3 run it still looks pretty healthy. Consumer
4 confidence is very high. We had a good holiday
5 season in 2018. And I think a lot of that will
6 continue as long as the unemployment rate remains
7 as low as it is and we start to see more money
8 coming into people's paychecks which, again, we
9 are sort of incrementally starting to see now,
10 according to some measures that we look at.

11 So short run, I think it's healthy. But
12 I think a lot of the risks that we talk about
13 with, you know, some of the stimulus wearing off
14 and, certainly, again, some of the risks that,
15 you know, that I mentioned and that you kind of
16 referenced, whether it's, again, the trade war
17 and government shutdown are two kind of big
18 examples of where you're going to see,
19 potentially, an impact on consumer confidence, an
20 impact on spending. And so as we sort of, you
21 know, see these risks less offset by some of the
22 stimulus in the economy, I think by the time you
23 get to next year that there is going to be a
24 little bit more concern there.

25 MR. MICHAEL: You know, over a decade

1 ago, leading into the last recession, one of the
2 imbalances or triggers, it could be argued, that
3 high levels of debt for consumers in households
4 that weren't sustainable and it ended up creating
5 problems --

6 MR. KAMINS: Right.

7 MR. MICHAEL: -- for the economy. We've
8 had sluggish wage growth but how are household --
9 what's the outlook for household debts?

10 MR. KAMINS: I mean, household balance
11 sheets look pretty solid. I think -- I don't
12 think household debt is going to be a major issue
13 leading into the end of this cycle.

14 I think the bigger concern on our end is
15 actually corporate debt, that there's a lot of
16 leverage lending happening. And because interest
17 rates have been so low for so long, you've had a
18 lot of debt accumulating in the corporate sector.
19 And I think that that is a real concern. And I
20 mean, that eventually could make its way into,
21 you know, weakening wage growth, for example, if,
22 you know, if that gets firms into trouble, for
23 example.

24 So I think that would be a channel that
25 I'd be more concerned about. I don't think

1 consumer balance sheets are a major problem,
2 speaking from kind of a macro perspective.

3 MR. MICHAEL: Okay. Do you want to jump
4 in that before we move --

5 MS. ASMUNDSON: I just was going to say,
6 and I'd like to hear Rachel's thoughts on this,
7 as well, you know, we're kind of at a different
8 place right now in terms of the demographic cycle
9 in that a lot of the baby boomers are either
10 retired or about to retire. And so the
11 composition of that, even though the aggregate
12 amount might not look terrible, in California
13 there's fewer people who are homeowners so
14 there's less mortgage debt, but the levels of
15 student debt, which is not able to be gotten rid
16 of in bankruptcy, that's also much higher.

17 And so the two factors that might
18 constrain people from adjusting in the next
19 recession are younger people who have lots of
20 student debt and can't get rid of it and older
21 people who can't work for longer.

22 MR. MICHAEL: That's interesting. I
23 mean, the aggregate level household debt is a bit
24 lower but the composition has changed.

25 Rachel, do you have a comment?

1 DR. CORTES: I'm a demographer, so just
2 so everybody knows.

3 MR. MICHAEL: Yeah.

4 DR. CORTES: I don't know a lot about
5 this stuff. But I did, when you were talking
6 about that, I did kind of think about student
7 debt as, you know, someone with a little of my
8 own. And I'm also thinking about the growing
9 baby boomer population in San Diego County.

10 And something that I keep thinking of is
11 maybe another scenario is, you know, we kind of
12 assume that generations will kind of want to act
13 the way they want to act today, but if they don't
14 act the way they act today and they move out of
15 San Diego because their house is worth, you know,
16 five times what they paid for it and they decide
17 to move somewhere else, and maybe they move
18 outside of the country even?

19 So I think San Diego County, I mean, most
20 of the population growth we're projecting is in
21 the age of 65-plus, and we're just not seeing
22 fertility rates kind of keeping up with that. So
23 there's a lot of universities there. Those
24 people come in maybe with debt and then they take
25 it with them when they can't find a high-paying

1 job in the county.

2 So I think, I mean, I personally would be
3 concerned about student debt especially, how it
4 pertains to home ownership.

5 COMMISSIONER MCALLISTER: Can I ask a
6 quick question, just about the demographic
7 changes?

8 So population growth is kind of slacking
9 off, not what it used to be. Could you sort of
10 break down the composition of that population
11 growth or sort of what the sort of inflows and
12 outflows and where they're coming from?

13 DR. CORTES: I mean, Irena can do that
14 for the state. I can do it for San Diego County.

15 I think most of our population growth is
16 still due to natural increase because San Diego
17 still has kind of a net-zero intention. We in-
18 migrate a lot of people from foreign countries
19 but we out-migrate a lot of people of kind of
20 those working age groups to different, probably,
21 adjacent counties, but also to other counties
22 within the United States.

23 We've been a majority-minority county for
24 a while now and that will kind of continue to
25 grow, I think, into the next -- obviously,

1 continue to grow. And yeah, the -- I mean, in
2 terms of like education, you know, education is
3 increasing for all age groups, but are they going
4 to stay and work in San Diego, is really what
5 we're not sure about.

6 Maybe Irena can speak more to that.

7 MR. MICHAEL: I think I actually kind of
8 have a list of demographic questions that we'll
9 probably get to in about 15 minutes, and then we
10 can go into a lot more depth in this. But I do
11 want to sort of put a little bit of a wrap on the
12 discussion.

13 I think, Jerry, I sort of had a comment.
14 I also wanted to just ask, also, about the
15 partial government shutdown. You know, we're
16 several weeks into that with no end in sight. So
17 any thoughts on how that could affect the
18 outlook?

19 MR. NICKELSBURG: The -- I actually have
20 two comments now.

21 MR. MICHAEL: Yeah.

22 MR. NICKELSBURG: So the first has to do
23 with recession probabilities. And you're hearing
24 a lot of, you know, 50-50, flip a coin. If you
25 actually look at statistical models on recession

1 probabilities, they show very low probability
2 until you're right on it. So there's not much
3 forward looking information, statistical
4 information, when it comes to recession
5 probabilities.

6 The same is true with triggers. If you
7 look at what triggered the past four recessions,
8 we were past it before we knew that trigger had
9 happened. So you have to kind of think about the
10 things that are going to drive a recession and
11 try to recognize them before we statistically
12 recognize them.

13 So that was one comment about, you know,
14 why are people flipping a coin and saying 50-50?
15 It's because statistical models don't really tell
16 us.

17 With respect to the energy forecast, and
18 something that really is changing, and this
19 addresses the discussion about housing and
20 demographics, one of the things that we're
21 seeing, more in the Bay Area than elsewhere, is
22 an increase in job growth in excess of population
23 growth and an economy with less than two-and-a-
24 half percent unemployment. So how does that
25 happen? Partially, it's bringing retired people

1 back into the workforce, but partially, it's
2 retired people moving out and younger working-age
3 people moving in and taking their houses.

4 So the relationship, the historical
5 relationship between employment growth and energy
6 demand, you know, is changing. It's not that
7 employment growth is generating new homes and
8 additional energy demand. It may just be, at
9 least in some sense, a swap, so one should be
10 thinking about that in the forecast.

11 Now you want to start on the government
12 shutdown. So the big question is how long?

13 Right now, if the shutdown ended before
14 this conference, probably not much of an impact
15 because wage is paid retroactively and there's
16 some impact but maybe not huge. If it goes on
17 for, you know, for quite a while, if it goes on
18 into say mid-February, I think that really
19 elevates the risk of consumer confidence dropping
20 dramatically. And consumption, as we've all
21 talked about, you know, correctly, has been the
22 driver of the latter part of this recovery or
23 this expansion, that turns around.

24 MR. MICHAEL: I think let's start to move
25 into a bit of the regional discussion. And I'm

1 going to ask Rachel to come back in again.

2 I know you jumpstarted it a little bit,
3 but if you want to add some additional
4 discussion, I'd like to talk a little bit about
5 the regional economy which are -- and there's
6 certainly demographic trends embedded in this.
7 And let's start in Southern California and San
8 Diego and some other areas of Southern
9 California.

10 DR. CORTES: Yeah. Thank you. Okay. So
11 at SanDAG we create we create a forecast every
12 four years to go along with the transportation
13 planning cycle. So the current forecast looks
14 out to 2050 and we're predicting 700,000
15 additional population, the need for about 400,000
16 additional housing units, and about 360,000 jobs
17 increasing from the base year. So like I said,
18 most of that growth is in the population 65 and
19 older. So today, it's about 17 percent of the
20 population in the county is 65 or older. In
21 2050, it would be about 34 percent of the
22 population.

23 And just a kind of interesting thing that
24 we did was look at the kind of working age, old
25 age dependency ratio. And San Diego County would

1 have a ratio that's near what Japan is today by
2 2050. So we're definitely paying attention to
3 the way countries, industrialized countries are
4 going to be dealing with that.

5 Something that's already been touched on
6 is kind of people working longer into retirement,
7 but maybe it doesn't look the same as it does
8 preretirement. Is it part-time? Is it less
9 engagement?

10 And then also kind of something I think
11 about a lot is the healthcare needs, just the
12 infrastructure for that, hospitals, clinics,
13 things like that, but also the workers. So a lot
14 of the job growth that we see in San Diego County
15 is typically low-wage jobs, so retail, service
16 industries, wait staff, because a lot of the
17 economy is tied to tourism.

18 But also in healthcare, we are predicting
19 job growth in that capacity. But also -- but,
20 unfortunately, or maybe fortunately, it's kind of
21 in the lower-paying healthcare jobs, so not
22 necessarily doctors and, you know, nurses but
23 home workers and things like that to support
24 people who are deciding to age in place.

25 So I think that's kind of something that

1 we're interested in, seeing how that would affect
2 the overall growth of the economy in San Diego.
3 And I think there's places to look to, to see how
4 we react to it. But right now, I think it's kind
5 of an unknown.

6 Oh, well, and then maybe the housing
7 growth. So I would say in past forecasts, we
8 haven't predicted this much need for housing
9 growth. But we've -- San Diego has had a vacancy
10 rate that's been kind of unreasonably low for
11 many years. And in order to kind of balance
12 that, to have something, more of a healthy
13 housing market where people could enter it when
14 they wanted to and not be forced, you know, to
15 rent or have roommates when they don't want to is
16 the reason that we're kind of seeing the need for
17 more housing unit growth. And fortunately, we're
18 also seeing some of the local jurisdictions come
19 around and show capacity for that growth which is
20 something that hasn't happened in the past.

21 MR. MICHAEL: I'm going to ask the panel
22 for any other insights about Southern California?

23 And since you're leaving early, Jerry,
24 maybe I'll pick on you again.

25 MR. NICKELSBURG: Sure. So I think one

1 thing that we can -- that we need to keep in mind
2 when we're looking at new permits for housing is
3 that over the last two years, we're down 30,000
4 homes to the wildfires. And so we have, in our
5 forecast, an increase in building from 100,000
6 going up to, ultimately, just shy of 140,000, but
7 we have 30,000 right now. And in Southern
8 California, in Los Angeles, Ventura and Santa
9 Barbara, it's about 3,000 to 4,000 homes just to
10 stay where we're at.

11 But what we are seeing is developments
12 further out, longer commuting. So jobs that are
13 being created in Los Angeles County are being
14 created for people who are now living
15 increasingly in the Inland Empire where there's a
16 new project that was just approved, the Tejon
17 Ranch which is actually quite far away from the
18 city, and the Newhall project which is up in the
19 Canyon Country. So we're seeing sort an increase
20 in spread in order to provide additional housing.

21 But still, the housing growth is not
22 sufficient for continued job growth and economic
23 growth that we've seen, you know, in the last
24 decade.

25 MR. MICHAEL: You see the housing

1 constraint being really critical to sort of the
2 L.A. economy. Is there anything sort of in the
3 industry sectors or picture that is happening
4 there that we should make note of?

5 MR. NICKELSBURG: So I'm not sure how
6 this effects an energy forecast --

7 MR. MICHAEL: Right.

8 MR. NICKELSBURG: -- but the Los Angeles
9 economy is one in transition. And if you look at
10 the numbers, you don't see as rapid growth in
11 employment in Los Angeles as you see in some
12 other parts of the state. If you disaggregate
13 Los Angeles to West Los Angeles and the Tri-
14 Cities, which is where the entertainment industry
15 is and where Silicon Beach is, and it looks very
16 much like Silicon Valley.

17 So what's happening is that Los Angeles
18 was one of the last economies, certainly in the
19 state and in the U.S., who's really dominated by
20 old line manufacturing. And that got hit hard in
21 the last recession. That's kind of going away.
22 Those jobs are not coming back, while these new
23 jobs are happening. So we're seeing a real
24 transformation in L.A.

25 And just kind of back on housing, we're

1 seeing more multifamily housing, particularly
2 along the new light rail transit corridors, so
3 we're seeing a lot of change going on. But you
4 know, if you want to disaggregate to get down to
5 energy usage, you've got to be cognizant that
6 we've got different industries that are growing
7 than were growing in the past.

8 MR. MICHAEL: Well, the overall
9 employment growth, you know, the Inland Empire, I
10 think, in recent years has the fastest overall
11 employment growth in California.

12 MR. NICKELSBURG: Correct.

13 MR. MICHAEL: And it's also a commuters'
14 center. Is that -- does that represent any
15 better balance of jobs and population?

16 MR. NICKELSBURG: So there are two things
17 that are happening in the Inland Empire. One is
18 the near-in cities, that is those that are close
19 to the Los Angeles, Orange County and San Diego
20 borders have experienced a growth in housing and
21 growth in employment, and so that's kind of the
22 commuting, the bedroom communities.

23 In San Bernardino County, you have
24 enormous growth in logistics. And millions,
25 literally millions of square footage of new

1 warehouses, all of which are leased out prior to
2 getting a certificate of occupancy. And we do a
3 survey of developers. And their view is that
4 this is going to be, you know, has been and will
5 continue to be the norm in the Inland Empire and
6 for industrial space in Los Angeles over the next
7 three years, that there's just simply not enough
8 space.

9 And that's one of the biggest drivers of
10 employment growth in the Inland Empire, is this
11 logistics industry which is, you know, we talked
12 a bit about retail doing quite well in this last
13 holiday season, it was online retail that was
14 doing quite well. And that speaks well for
15 California's logistics industry.

16 MR. MICHAEL: So that's a dynamic that
17 we've also seen in Northern California.

18 MR. NICKELSBURG: Right.

19 MR. MICHAEL: And I might use that as a
20 transition to bring Cynthia into the discussion
21 to talk a little bit about the Northern
22 California economy, you know, starting off with
23 the Bay Area which has been this economic dynamo
24 this decade. Every data point seems stronger
25 than the last and certainly surpasses my

1 forecast.

2 So could you tell us a little bit about
3 the Bay Area economy?

4 DR. KROLL: I'd be happy to. It
5 surpasses my forecast too. And as we go into our
6 new four-year cycle of forecasting, we look at
7 each other and say this can't go on forever. It
8 never has. It's been, in the past, very
9 volatile. And so when it turns around it's often
10 not a pretty picture.

11 However, at the same time, it's been a
12 very resilient economy, one that, even after a
13 big downslide, comes back with something bigger
14 and better. So what makes it like that? It has,
15 I'd say, all the basic components that make it a
16 strong economy. It has a very strong higher
17 education sector. It's had the advantage of a
18 buildup of lots of talent from the defense
19 industry, which then the money went away and the
20 whole structure of business in that area, as
21 AnnaLee Saxenian identified in her Regional
22 Advantage book, has been -- was, at the time,
23 rather different than many other companies today.
24 I don't know that it's as different now,
25 but it involved a much more cooperative,

1 collaborative attitude towards work and working
2 with others that involved much more flexibility,
3 and it involved a fluidity of organizational
4 structures so that as needs changed, so did the
5 companies that were growing. Lots of -- and that
6 led to lots of new entrepreneurship, lots of
7 development of new businesses, of new types of
8 industry.

9 So those -- and around it then, built up
10 the kinds of resources that entrepreneurs,
11 innovators need. The area still captures a large
12 share of the nation's venture capital. And it
13 also has other types of services, like legal
14 services, to help companies as they develop. So
15 it, in turn, has built this agglomeration.

16 Another thing -- but it's not just
17 Silicon Valley. And in fact, if you look at
18 what's happening to the employment trend, San
19 Francisco has really changed in terms of its
20 share of employment recently. It was the key
21 employment center in the Bay Area about 40 years
22 ago when I started doing this work, and a key
23 finance center. It's really -- it's finance has
24 become much more specialized. It's not a banking
25 center in the way it was, although it still has

1 some key banks. But it has built on the Silicon
2 Valley strength and become a new center of
3 multimedia and social media.

4 And that's been allowed to happen because
5 the city really changed its attitude towards the
6 way it handled growth. It opened up some areas
7 to encourage business development. It worked
8 with the University of California, San Francisco
9 to build up a whole center for biotech.

10 And so this is a case, I think, where the
11 local government was really controlling how much
12 growth went in there and changed that picture and
13 it's now a much more dynamic economy than it
14 would have been if those changes hadn't taken
15 place. And it's really, I would say, as
16 important as Silicon Valley in the growth of the
17 region right now.

18 The area still has -- it has -- you know,
19 it's had a lot of the raw material that you need
20 for this kind of growth but -- and it stands, in
21 some ways, to be competitive in what's still a
22 pretty regulated environment. I don't think it
23 can sustain this forever. And I guess I've been
24 expecting it to turn around. I think it's likely
25 to be respond, to be not that resilient as if the

1 economy goes into recession. I think the Bay
2 Area will also go into recession.

3 What I see as some of the risks? Well,
4 the housing market continues to be a big risk for
5 the Bay Area, and that's certainly controlling
6 how much employment growth can go there. It's
7 shifting the kinds of employment growth that
8 happens.

9 And so logistics jobs, for example, are
10 moving out to the Central Valley, although all
11 those millions of square feet of logistics space
12 that go out there don't translate into that many
13 jobs; it's important to keep that in mind. And
14 some of those jobs still stay in the Bay Area
15 because they're just simply distributing a lot of
16 these goods that people order online.

17 In terms of the housing market, there are
18 a couple of challenges. One is certainly the
19 willingness of communities to take housing, but
20 that's changing. Oakland has had a huge amount
21 of growth in multifamily in the last five years.
22 San Francisco has had -- has put in a lot of
23 multifamily housing. San Jose and other parts,
24 some other parts of Silicon Valley. There is a
25 backlash in some areas. But a lot of it is still

1 high end. And there's a significant proportion
2 that is subsidized for very little and low
3 income. The middle is definitely still missing.

4 And with the wildfires that were
5 mentioned, the costs of construction are
6 skyrocketing. And so even as space opens up for
7 new building, the ability to actually put those -
8 - to put in something that's affordable to this
9 middle sector of the labor force is still very
10 limited. So that's one thing that can slow
11 things down.

12 Another is product cycle effects. A
13 typical pattern of these innovative industries is
14 that they expand quickly in the place where they
15 start. But then if they're in an expensive
16 place, like the Bay Area, I guess two things
17 happen. One is that eventually they level off a
18 bit, and also they begin to expand to other
19 places in terms of who they're serving and where
20 they do production.

21 One of my concerns with the kinds of
22 sectors that we're seeing growing now is that a
23 lot of the demand for that is from millennials,
24 and they're really at their peak right now. But
25 this is now talking about more 20, 30 years hence

1 as we do in our forecast. We can't count on that
2 demand to grow forever. So we're likely to see a
3 reorganization of those sectors. And the
4 question is: Will the valley and will San
5 Francisco come up with a whole new industry that
6 will grow in its place?

7 I think some of the other risks are
8 migration and immigration policy. We're very
9 dependent on entrepreneurs who come here for
10 their education and stay here and build new
11 industries, and they often do expand their
12 industries outside of the Bay Area. But if they
13 stop coming here because the country is not
14 welcoming, then we lose one source of that
15 innovation.

16 Another thing that's happening is kind of
17 the maturing of some of our big growth
18 industries. And Apple is a good example of that.
19 Of course, a lot of their growth has happened
20 other places, but they still have a huge
21 workforce in the Bay Area. And it makes me
22 nervous when these companies start building their
23 flagship corporate space because it's a sign that
24 they're really changing in how they think of
25 themselves as a company.

1 And then we're, also, we're doing a
2 prospective paper right now on how jobs will be
3 changing over the next 30 years as part of our
4 scenario building process for our forecast. And
5 one of the things we're looking at is the effects
6 of automation, artificial intelligence, and the
7 whole change in the work process that we don't
8 think will necessarily be a job killer, it could
9 really be a job grower in places like Silicon
10 Valley but may also change the kinds of jobs that
11 are available, the kinds of incomes that people
12 have and where work takes place.

13 MR. MICHAEL: Great. Thank you for that.

14 I'm going to grab one of the threads that
15 you talked about that I think is a nice
16 connection between our economic forecast and
17 transitioning to demography, and that was
18 immigration. And I saw several people on the
19 panel sort of perk up at that topic because we
20 didn't actually really discuss immigration in
21 terms of the economic outlook.

22 So I don't know, I might -- Irena has
23 been quiet lately, so I might ask for some
24 perspective on that.

25 MS. ASMUNDSON: Sure. So in both our

1 demographic and our economic forecasts, we assume
2 that there aren't big changes to migration. So
3 California tends to have net-positive immigration
4 because we get a lot of people from abroad, but
5 then we also lose, on net, quite a few people to
6 other states. You know, part of this is because
7 California tends to be a landing place. And so
8 some of those international immigrants like to
9 move onto other states.

10 Other parts of it are that there is a
11 sorting effect that happens for California.
12 California is very high tech. It is relatively
13 expensive. To live here comfortably, you have to
14 be relatively wealthy. And so we see more
15 educated people moving into the state and less
16 educated people in California leaving the state
17 for places where it's easier to find those lower-
18 skilled jobs.

19 So if we were to see a huge crackdown on
20 legal international immigration, that would turn
21 to a negative, probably. So California would, on
22 net, lose people to other states more than we're
23 growing.

24 And Rachel had mentioned the natural
25 increase. We actually have Figure Demographic

1 01.

2 I hope that answers your question,

3 Andrew --

4 COMMISSIONER MCALLISTER: Yes.

5 MS. ASMUNDSON: -- about like what we
6 see. And so we're seeing more births than deaths
7 still. At some point, that that's going to
8 equalize a little bit.

9 MR. MICHAEL: Rachel, you're from our
10 largest border region in San Diego, so any
11 thoughts on the immigration issues?

12 DR. CORTES: Yeah. I mean, the thing
13 that I was thinking about recently was when the
14 border was actually shut down because of the
15 caravan that was coming over the border. And
16 that really impacted -- I mean, I think there's
17 probably been studies on what -- I don't know
18 what they are, but on the impact of how that,
19 just a day or two of that happening, how it
20 impacted San Diego.

21 I know, like anecdotally, people come to
22 SanDAG from Tijuana every day, they make that
23 trip every single day. So not being able to make
24 that trip, it effects, I would say, probably
25 every level of industry. And it's not just, you

1 know, these kind of low-paying jobs that we
2 associate with Tijuana and the border cities.

3 And, yeah, the -- what Irena was saying,
4 also, about attracting kind of -- and also,
5 Cynthia, everyone's been saying, about kind of
6 attracting these higher-education level migrants
7 that are able to stay here because they can
8 afford to. But, yeah, how is that going to
9 change? And where will they go instead? And
10 what will we lose out on if they do? So it's
11 something to think about.

12 MR. MICHAEL: Jerry?

13 MR. NICKELSBURG: So we've been talking
14 about this immigration and immigration of highly-
15 skilled individuals and how that benefits
16 California, and it certainly does. But let's
17 suppose just for the moment that the level of
18 immigration stays the same but the criteria that
19 are applied to potential immigrants is oriented
20 towards highly educated and highly skilled. That
21 has a negative impact on California, as well. It
22 has an impact on our agricultural sector. And it
23 has an impact on construction.

24 And you know, we've all expressed that
25 the limitation of housing and the building of new

1 homes is sort of key to keeping up high growth
2 rates. Well, that's going to create capacity
3 constraints in the construction industry that we
4 really haven't seen before.

5 So it's not just the highly-skilled
6 immigrants that are important for California,
7 it's really all across the spectrum. And I think
8 that we are kind of moving away from the lower-
9 skilled immigrants who are going to take these
10 kinds of jobs and, yes, maybe ultimately move to
11 other places. But that flow is important,
12 particularly in the agricultural sector.

13 MR. MICHAEL: Adam, are you still on the
14 line?

15 MR. KAMINS: I'm still here.

16 MR. MICHAEL: Yeah. Okay.

17 MR. KAMINS: Yeah.

18 MR. MICHAEL: Any comment, talking about
19 that?

20 MR. KAMINS: Yeah. Absolutely. I think,
21 so I agree with what's being said about the
22 impact of immigrants broadly across, you know,
23 highly-skilled, lower-skilled industries. I also
24 think from just a demand perspective; you need to
25 think about what the impacts would be.

1 So California, actually, you know, where
2 I am in the northeast, this is more of a concern,
3 but California, actually, in some ways mirrors
4 the northeast in this respect much more than it
5 does the rest of the west in that if you strip
6 out international immigration and just look at
7 natural population growth and domestic migration
8 where, of course, as some of the panelists are
9 saying, California, on net, is losing residents
10 to other states, eventually, by the time you get
11 10, 15, 20 years out, you would be looking at
12 population losses, not gains.

13 And so generally, if you are going to
14 lose, you know, a large share of skilled,
15 unskilled immigrants, whatever the case may be,
16 not only are you losing, you know, potential
17 innovation and a source of labor, but it also
18 would have a significant effect on consumer
19 industries and on just consumption and housing
20 demand in general.

21 So I think, you know, really, it's a
22 pronounced issue across the U.S. But I'm hard
23 pressed to think of a state where immigration
24 means more than California.

25 MR. MICHAEL: Okay. I think let's

1 transition to -- we've been sort of touching on
2 aspects of demography, but let's transition to a
3 little bit more detailed discussion of demography
4 in housing.

5 And I think Irena mentioned the 2018
6 growth estimate from Department of Finance, 0.54
7 percent population growth. U.S. Census had an
8 estimate that came out recently that was actually
9 a little bit lower, 0.4 percent. I don't have
10 DOF, you know, 100 years of DOF's estimates on my
11 desktop, but Census I do. And you know, that was
12 one of the numbers that I noticed recently. I
13 went back in history and I think that was the
14 lowest one-year percentage growth the Census had
15 estimated for California's population going back
16 to 1900. It had gotten close a few years in the
17 '90s but I think that was the lowest. So
18 clearly, we have a slowing population growth in
19 2018.

20 So I'm going to ask Irena to talk a
21 little, in a little more detail, about Department
22 of Finance's estimates and projection going
23 forward. You know, is this the new normal?

24 MS. ASMUNDSON: So over my time at
25 Finance, I have learned far more about

1 demography, so Rachel can jump in tell me if I'm
2 saying something that it is a little bit
3 misinterpretation of the data.

4 So we use a number of different sources.
5 You know, we use Department of Homeland Security
6 sources. We use births and deaths from the Vital
7 Statistics. We also use, for example, DMV's
8 statistics about who is where. And we use IRS
9 data to look at who has moved to other states.

10 And so one of the reasons why Census had
11 such a lower number than we did is because they
12 had some access to data and they interpreted it
13 in a particular way that showed, actually, that
14 far more people were leaving California than what
15 we had assumed.

16 And so we're going to be looking at our
17 methodology over the next couple of months to try
18 to figure out, yeah, is that a good
19 interpretation? And, in fact, are we seeing some
20 of the housing constraints that we've been
21 talking about for several years now. Is that
22 actually really having an effect on what people
23 are choosing to do and where they choose to live?

24 And, you know, I've had several
25 conversations with Cynthia and Jerry and other

1 colleagues about, you know, in economics there's
2 really only one law left which is if something is
3 unsustainable, it has to stop. It's just a
4 question of when it's going to stop.

5 But the levels of housing in California
6 are so low compared to what our population is.
7 Part of that could be that there are accessory
8 dwelling units that haven't been permitted and so
9 aren't included in our stock.

10 But I keep coming back to the statistic
11 of one in five California households pays at
12 least 50 percent of their income in housing
13 costs. That is -- that's shocking, one in five
14 households. So if you have a dual-income
15 household and you're paying 50 percent of your
16 household income in housing costs, if someone
17 loses their job, you're basically homeless the
18 next day. Okay, maybe not that extreme. But you
19 really are kind of living on the edge. And so
20 what are these people going to do when that
21 recession happens? Do they have the means to
22 leave the state or do we just have this terrible
23 situation?

24 The other statistic that I do want to
25 mention in terms of demographics, we have looked

1 at a number of different ways of calculating how
2 many housing units you need to just to sort of
3 keep up with population growth. And for a while,
4 I think HCD and us were -- and LAO, I think, as
5 well, were using the number 180,000 units every
6 year to keep up with population growth.

7 We looked at the past history and we
8 upgraded that, actually, because a lot of the
9 building more recently has been you demolish
10 single-family homes and upzone it, so then you
11 build multifamily housing. So you need a certain
12 amount of destruction to do this infill, and so
13 that's maybe about 10,000 units a year. And then
14 because of the new normal of all the disasters,
15 that's probably another 10,000. So we're saying
16 the new benchmark that you need in terms of
17 housing is probably around 200,000. We're
18 nowhere close to that. I think, it looks like,
19 2018 will probably have gotten around 120,000.
20 And in our forecast period, we don't get anywhere
21 close to the 200,000.

22 MR. MICHAEL: So I'm just going to make
23 an observation because last year's population
24 estimate was less than 200,000 new Californians.
25 So wouldn't -- was it not low, .5? I don't know,

1 we can do the math.

2 MS. ASMUNDSON: Right.

3 MR. MICHAEL: But I mean, that
4 calculation of just to keep up, you know,
5 embedded in that is that we're going to return to
6 at least a somewhat higher level of population
7 growth than we are today?

8 MS. ASMUNDSON: No. So, okay, these
9 things don't necessarily track. And here is
10 where, I think in your forecast, you probably
11 should maybe think about the underlying trends
12 that are changing a little bit. When we look at
13 these trends, we look at adults. And so we have
14 a much lower birthrate now than we used to. And
15 so the number of people who are becoming adults
16 who you would normally think of as establishing
17 households, that is higher than the total net
18 population.

19 So we benchmark our numbers to the
20 increase in the number of adults, not the total
21 increase in the number of people.

22 MR. MICHAEL: So that's one of the
23 interesting drivers, actually, declining
24 birthrates. I think we've all seen that in the
25 data. I'm wondering maybe, Rachel, do you have

1 any comments on the trends there and where we
2 expect that to go?

3 DR. CORTES: Maybe just to talk about
4 kind of the housing need versus like the adults.
5 And then -- because I think in San Diego, you
6 know, we're talking about building this forecast,
7 it's like what we anticipate the need being and
8 not kind of keeping the status quo of having
9 multiple families, you know, multiple roommate
10 situations. And we're anticipating family size
11 going down as the population increases.

12 So it's kind of like we're anticipating
13 this need because we know that the kind of style
14 that people live in isn't -- we don't anticipate
15 that to be the same as it is today, people taking
16 on multiple roommates in their thirties and
17 forties and fifties and sixties. You just
18 don't -- you don't see that in the United States.
19 And so we need more units to kind of keep up with
20 that growth so people can live the way they want
21 to live and not be forced to triple up because
22 there's no units available.

23 San Diego County has a lot of, you know,
24 non-White migrants coming in. And they kind of
25 keep our birthrate at -- you know, I'm pretty

1 sure we're below replacement but not too far
2 below replacement levels. And so we really, just
3 like the rest of kind of the United States and, I
4 guess, California rely on the higher birthrates
5 of recent immigrants to kind of keep us above
6 replacement levels, and I think that might
7 decline. I think a lot of times, I don't know
8 how the DOS does it, but kind of assuming that
9 all of those kind of converge in the future and
10 then we're all kind of washing out that advantage
11 in the next 20 or 30 years, so --

12 MR. MICHAEL: Yeah. So anybody else have
13 observations on this population versus household
14 growth issue? I think that's an interesting
15 topic.

16 MR. NICKELSBURG: Just one point on that.
17 Declining birthrates are not a California
18 phenomenon, they're a worldwide phenomenon. And
19 so anywhere in the world where you have a
20 reasonably affluent population or educated
21 population, birthrates have been plummeting and
22 have been for decades, and that includes China
23 today is less than replacement and their
24 population is shrinking.

25 So the only reason why the U.S. has

1 defied this trend is immigration, and so that's
2 the U.S. overall, certainly for California. And
3 one can expect that to continue, especially if
4 immigration becomes tighter, and birthrates will
5 continue to fall. They might level out at some
6 level but definitely not replacement.

7 MR. MICHAEL: On the housing question
8 there's been some discussion about what some of
9 the job centers and the coastal population
10 centers are doing with respect to housing. And
11 some of the comments have actually been kind of
12 optimistic, maybe that there is starting to be a
13 little bit more production. So I'm interested
14 in, you know, what do we see for current housing
15 production and future housing production? Could
16 we actually see the situation improve in some of
17 the employment centers and the coastal areas of
18 California?

19 DR. KROLL: I would say current
20 production is improving but we're far from
21 building the level that we estimate we need
22 annually to meet the employment growth pressure.
23 And we have a lot of discussion in doing our
24 forecasts as to how much we should take that
25 housing limitation into account as we predict how

1 much employment we're going to get. So that's a
2 real challenge for us.

3 I think it's also -- I brought this up a
4 little bit, the challenges to whether we're
5 building the right housing in the right place
6 for -- and for the population now versus the
7 population 10 or 20 years from now. And I want
8 to reiterate the point that I think Rachel made,
9 that we -- that as the millennials move out of
10 their, what I think as their apartment years into
11 their family-forming years, they may not have as
12 many children but there will be a share of them
13 that really want that -- we can't necessarily
14 count on their wanting to stay in the urban
15 centers.

16 And so another dilemma that we're really
17 facing is where to encourage growth within the
18 region, what kinds of places? Do we try to build
19 denser places around smaller communities but that
20 allow for single-family homes, as well? Or do we
21 really hope that if what's available is
22 multifamily, that's where people will choose to
23 live?

24 I wanted to bring up something about
25 energy use, too, because I think, also, you

1 talked about as older people move out of their
2 homes where they're often using much more space
3 than they need and perhaps not using that much
4 energy in that space and younger families move
5 in, even if the housing numbers don't go up that
6 much, there may be some real increases in the
7 amount of demand for energy. But, of course,
8 hopefully it's all going to be built in a much
9 more efficient way.

10 MR. MICHAEL: Let's talk a little. I
11 noticed, I observed Cary's slide about population
12 growth in various regions of the state of
13 California. I work primarily here in Sacramento
14 and the North San Joaquin Valley areas. That's
15 one of the regions that he has a relatively fast
16 population growth in this area, as well as the
17 Inland Empire. We've seen significant increases
18 in commuting. I think north San Joaquin Valley,
19 Stockton-Modesto area is not over something like
20 86,000 daily commuters. It's been growing at
21 about six percent a year over the past -- this
22 decade, and that's certainly part of the
23 population growth we see there. Not quite as a
24 strong a flow as from Sacramento, I know it's a
25 little further away, but that's growing in this

1 region, as well.

2 But one of the interesting observations
3 that I had from Cary's slide is that if we look
4 at where the fastest and the slowest population
5 growth in the state is, is that the answer to
6 both those questions is outside the coastal and
7 metro areas. So the fastest population growth in
8 the state are in some of these inland areas that
9 we've discussed. But we have parts of California
10 that actually have declining population.

11 And so I think if we look at the areas of
12 California that are growing faster and which are
13 declining in population, I'm wondering if we have
14 some observations on that issue and maybe the
15 expectation for the future? I don't know.

16 MR. NICKELSBURG: Well, and let me make
17 just a couple of comments, but I haven't really
18 delved deeply into it.

19 So one of the areas that that slide
20 showed was losing population of the northern
21 counties in the state. And their economies were
22 built on mining and logging and fishing. And
23 those industries, you know, are maybe not gone
24 but they're very much diminished. There has been
25 expressed a lot of hope that the cannabis

1 industry would revive that part of the state. It
2 looks like that's going to be quite modest. And
3 so I think that you can expect continued
4 population declines.

5 If you look at the age distribution in
6 those counties, young people are moving out.
7 It's, you know, kind of like West Virginia where
8 the young people and the educated people move
9 out. And you see the same thing on the east
10 slope of the Sierra. And in the Central Valley,
11 I think probably Kings County and some of the
12 other counties that are really predominantly
13 agriculture, as agriculture continues to
14 mechanize, due to the shortage of agricultural
15 labor, you may see that.

16 The one area that I think bears, you
17 know, a real close look is the Central Coast, so
18 that's Santa Cruz County all the way down to
19 Santa Barbara County. It doesn't seem to have
20 shared the growth in California and has really
21 lagged behind, has looked very much like a number
22 of inland areas. And whether that will start to
23 grow again, and, you know, there's plenty of room
24 for additional population, but it doesn't seem to
25 be happening. So I think that's a place to kind

1 of focus on because more centrally located seems
2 like it's more advantageous but it's definitely
3 not sharing in the prosperity that we're seeing
4 in other parts of coastal California.

5 MR. MICHAEL: That's an interesting
6 observation. I mean, we're seeing actual
7 population declines in some of the rural areas,
8 and we're seeing the fastest growth in some of
9 these, you know, inland areas that are proximate
10 to the employment centers. But you know, some of
11 these areas that are a little bit further out
12 that haven't seen the declines, Central Coast
13 being a region, perhaps areas deeper into the
14 Central Valley, like the Fresno area, I believe
15 those areas have continued to show growth but
16 it's been slower than in the past. So it's -- I
17 don't have a prediction on that but it is
18 interesting that we've seen some places that were
19 slow growing sort of dip to negative and some
20 areas that are faster growing, if they're not
21 close to those urban centers, I've seen a similar
22 story.

23 DR. KROLL: Yeah. I wonder how the
24 tourism industry is playing into this, too,
25 particularly in the Central Coast where you

1 have -- may not have -- you may have a declining
2 population there but you may still have a
3 continuing housing occupancy there by visitors?
4 Probably not so much in the Northern California
5 counties along the Central Coast, I think that
6 could probably be part of what's going on.

7 COMMISSIONER MCALLISTER: Cary, can I ask
8 a quick question on this?

9 On the housing front, I guess, you know,
10 we're holding a lot of hope, putting a lot of
11 hope and aspiration in densification of housing.
12 And, you know, I think you've all mentioned that
13 in some way. Do we know if there are -- sort of
14 what densification, what policy -- you know,
15 because densification, do you think much of
16 what's happening is driven by policy or is there
17 a market driver, as well? Like what do we have
18 to do to kind of get more infill which has all
19 sorts of environmental advantages but, you know,
20 do people want it? It's sort of the demographics
21 of that is something that I'm not sure we
22 understand, but maybe you guys have looked at
23 that.

24 MS. ASMUNDSON: You've put your finger on
25 the question that everyone wants to know the

1 answer to. You know, you look at all of these
2 trends and either these trends just have to stop
3 and California has to stop growing at the same
4 rate that it has been growing or you can get this
5 densification.

6 The thing that happened recently that
7 really kind of frightened me about sort of how
8 the economic incentives are working is the fact
9 that Amazon decided not to go to a relatively
10 cheap place with relatively good infrastructure
11 that might have a university. I'm thinking
12 something like Pittsburgh or St. Louis, or, you
13 know, even Detroit, where they could have gotten
14 a lot more bang for their buck. They decided to
15 go to someplace that was already relatively
16 crowded, relatively built up, relatively
17 expensive. And so that seems to be that they're
18 making a bet on they want to be where all of the
19 other people are.

20 And so you do -- this, to me, means that
21 you do need increased densification. We don't
22 know how to do this because people don't like to
23 change the character of their neighborhood. And
24 in California, as well, we have this wedge in
25 incentives for economics whereby homeowners,

1 because of Prop 13, don't face any of the higher
2 housing costs. In fact, they like it when the
3 price of their asset appreciates by a lot. And
4 so if they tend to be voters, then they block
5 additional housing and it benefits them, but it
6 doesn't benefit the overall economy.

7 MR. MICHAEL: I mean, there's some -- so,
8 I mean, if local policy is a constraint here,
9 there's some discussion in Sacramento of the
10 state taking on a stronger position with respect
11 to local governments and their sort of powers to
12 control and shape housing and growth. Will that
13 make a difference, if policy gets more aggressive
14 to prevent those sorts of blocking techniques?
15 Is there a market for it? Do you think we'll see
16 significant growth?

17 Rachel? Yeah.

18 DR. CORTES: I don't know about the
19 state, but I know in like our local
20 jurisdictions, one of them doesn't have a state-
21 approved housing element for the low-income
22 housing and the allocation that they're asked to
23 do every other planning cycle. And I think what
24 happened there is that every time something kind
25 of comes up, they vote it down. And so I think

1 there's some kind of -- there's been -- it's kind
2 of been like you have to have a housing element.
3 Okay, well, what happens if I don't? Nothing.

4 So if something actually happened, if
5 they didn't have -- if they don't have this
6 housing element -- and then I think what I've
7 heard is that they'll be forced to have kind of
8 development in places where it was initially
9 voted down. I mean, it has to have an impact but
10 I don't know how quickly that could really take
11 place.

12 But -- and then I would also kind of -- I
13 just wanted to say, like in San Diego, the city
14 is really the one who's kind of needing the
15 housing, the housing kind of needs. They're
16 really open to building housing. And most of
17 that in the city is infill and it's
18 redevelopment.

19 And so what I'm thinking is if they
20 actually build any of it, that people will come
21 to it because it is closer to employment centers
22 and it's in an urbanized area where it's very
23 close to the beach, so it's an attraction. So
24 maybe people won't have to kind of come in from
25 Temecula and other counties.

1 So that's what we're seeing.

2 MR. MICHAEL: Is there a strong market
3 for denser housing if we can permit it?

4 MR. NICKELSBURG: So, I mean, there are
5 two questions here, there's a demand and a supply
6 question. Being an economist, I like both. The
7 demand is an open question as to is there a
8 demand for denser housing? Well, there seems to
9 be a demand for multifamily housing. Rental rates
10 keep going up and they're going up faster than
11 the increase in the supply would suggest, you
12 know, would suggest. So it appears there is
13 excess demand for multifamily housing and that's
14 what we see in rents.

15 But there's also, on the supply side,
16 there are capacity constraints. Even if the
17 state and local governments eased rules tomorrow,
18 we don't have the construction workers to build
19 that housing. And we're seeing that in Sonoma
20 County in the rebuilding, we're seeing it in
21 Southern California in the rebuilding from the
22 Thomas Fire, that we have hit capacity
23 constraints in construction labor. So it used to
24 be that you would ask contractors kind of, what
25 are the obstacles to building and you'd have a

1 whole lot of regulations, and labor was not one
2 of them. Labor is now a significant constraint.

3 So if we're talking about a longer run,
4 sure. But is there going to be much change in
5 the amount of building we have in the near term?
6 I don't think we have the capacity to build any
7 more rapidly than about 140,000. And if Irena's
8 analysis is correct, I think it may be
9 conservative, but 200,000 homes, we're not going
10 to get there, not in the near term, not even
11 close.

12 MR. MICHAEL: So there's a constraint,
13 yeah, and not just labor. And I'll echo this,
14 that I work a lot with building, both commercial
15 and residential. And it seemed like for the
16 longest time their complaints were regulatory,
17 fees. But I would say for the past two years
18 their primary concern has been costs, and not
19 just labor but materials.

20 Just this week, I was working with a
21 major electrical contractor and they were talking
22 about bidding out some large, new projects and
23 how their costs had escalated 12 percent over the
24 past year and working with the customer and the
25 prime contractor. And they said, well, that's

1 actually the lowest we've heard from any of them,
2 that the other bidders on the project have
3 actually even seen higher percentage increases in
4 costs.

5 So this is sort of, I suppose, a third
6 issue is even if we start to permit it, we've got
7 some extremely high costs of construction that
8 could leave us maybe a bit disappointed in the
9 response that we get.

10 COMMISSIONER HOCHSCHILD: Actually, can I
11 ask a question related to that?

12 I'm sure many of you are aware of the new
13 trend in residential construction of prefab
14 homes. So I visited one of those facilities this
15 year, Rick Holliday's shop out on Mare Island,
16 where they're doing, basically, these -- it's
17 like, essentially, an assembly line for homes.
18 They're building all-electric modular homes that
19 are -- the dimensions are such that they can put
20 one-half of the home on a semi-truck, so
21 basically two trucks to deliver a home. And
22 they're doing it, I think, for like \$65,000.
23 They have contracts with UC Berkeley and
24 elsewhere.

25 I was pretty excited to see it, also,

1 because there's no material waste when you know
2 the dimensions and everything is standard.

3 So is that a trend you could see growing
4 significantly or are there real constraints?

5 Because also, just in terms of advancing the
6 affordability of homes, it seemed promising. I'm
7 just curious if anyone on the panel has opinions
8 on that?

9 MR. MICHAEL: I can say a little bit
10 about it, but if others want to jump in?

11 I'll just say, that was an industry that
12 I think does have some potential. Ten years ago
13 I was -- I heard something about it, and then I
14 think it sort of fizzled in the recession. Even
15 when you talk to the builders themselves, like
16 not even a prefab home, like the electrical
17 company I was talking about is the way they're
18 getting more efficient is building and doing more
19 of the work in the shop before it goes to the
20 site. And so even in that, a non-sort of factory
21 built situation, you're seeing more offsite
22 production to lower costs for the same reason.

23 There are a couple of interesting
24 startups. I'm not quite sure where the -- you
25 know, they're sort of niche products now. It's

1 going to be interesting to see what the demand
2 and the acceptance from planners are. But
3 there's certainly, I think, an area that has
4 potential for growth. And even when you look at
5 the industry outlooks for areas, you talked about
6 Mare Island, there's Solano County, we're seeing
7 some new investment in the north San Joaquin
8 Valley and businesses that are starting to build
9 these sorts of productions, we may see that in
10 the Inland Empire. But if that gains traction
11 and reaches its potential it also has the ability
12 to, you know, provide a little bit of an economic
13 boost to some of these inland halo counties and
14 reduce commuting of construction workers.

15 So you know, I'm encouraged by the
16 potential of that but I'm not, at this point, I'm
17 not sure that it's -- how large it can get.

18 CHAIR WEISENMILLER: Yeah.

19 MS. ASMUNDSON: I would also want to say,
20 it's difficult to get the kind of scale that you
21 would need because it's much more difficult to
22 get modular prefab houses for multifamily. You
23 know, you can do some of it. You can do parts of
24 the framing and then you assemble parts of the
25 framing. But, yeah, and also, you know, this

1 tiny house movement, I've been looking at
2 Instagram's of tiny homes, it's really cute but,
3 you know, that's sort of like densification of
4 existing single-family homes. It's not really
5 getting the scale that you would kind of need.

6 So every little bit helps. But if you
7 want to get to the scale that you need, you kind
8 of need a fundamental change in how people think
9 about things.

10 CHAIR WEISENMILLER: Okay. I just have a
11 couple questions.

12 One is I was hoping to get people's
13 reaction to the impact of climate change on
14 California's economy. We obviously have fires.
15 We have sea level rise. Now we have the PG&E
16 bankruptcy. So, please.

17 MS. ASMUNDSON: All right. So I can't
18 say how I think it is going to be fixed but I
19 will point out a couple of things where there are
20 some inconsistent trends that I think that we
21 need to worry about.

22 So one is we have not built enough
23 housing where the jobs are. And so people have
24 incentives to move to less urban areas and do
25 these long commutes or retire to these, you know,

1 less urban areas where, potentially, the risk is
2 higher. I think Paradise was kind of a really
3 good example of this. People had moved there.
4 They didn't have insurance because they couldn't
5 afford it. They were kind of wiped out. They
6 tended to be older.

7 And this is one of the consequences of
8 the inconsistent set of policies that we have
9 where all of the jobs are increasingly densely
10 located and we don't have the housing for it, so
11 you kind of like push people out. That also is
12 places where it's riskier and it is more prone to
13 be affected by climate change.

14 And so if you wanted sort of a consistent
15 set of policies, you would put people where they
16 are a little bit more protected from those
17 natural disasters and also closer -- and if you
18 want to reduce emissions or reduce demand, they
19 would have to be located closer to where the jobs
20 are. And the way the set of incentives are set
21 up right now, it's not consistent.

22 MR. MICHAEL: Thoughts on climate change
23 from other panelists?

24 DR. KROLL: Well, I think there's also
25 risk of losing housing to climate change and

1 that's losing potential areas where we would have
2 built.

3 So at the same time, it's a -- and
4 responding to climate change is an area of
5 business growth in California. So there's a
6 whole balance between what it's doing to our
7 housing stock, what it's doing to our natural
8 environment, and how the economy is responding.
9 There's a lot of growth involved in trying to
10 respond to it.

11 MR. NICKELSBURG: So let me just, in my
12 last comment before I have to run and teach, echo
13 that.

14 Now California does not have as much in
15 the way of low-lying housing as many other
16 states. And so that's -- if there's any good
17 news in this, that would be sort of the
18 differential good news. But we do have low-lying
19 housing and we have infrastructure that's going
20 to have to be rebuilt with rising sea levels.
21 And then we do have a new climate that's coming
22 that's going to change agriculture, it's going to
23 change the way in which people live, it's going
24 to change other industries. That kind of change
25 will generate economic activity and a lot depends

1 on how its managed.

2 So you know, I think we're at least
3 fortunate that here in California, we're thinking
4 about this, and some other places in the U.S.,
5 they're not, but it's a huge challenge.

6 MR. MICHAEL: Well --

7 MR. NICKELSBURG: And with that, let me
8 thank you for the invitation, and I'm off to
9 teach.

10 CHAIR WEISENMILLER: Well, actually, I
11 want to thank you for both.

12 As you're leaving, I want to pop another
13 question which is just when I've been in China,
14 either under the Obama administration or under
15 the current administration, the basic message was
16 the Chinese really want to invest in California,
17 but the message from the Trump administration,
18 the ambassador, and certainly what the Chinese
19 determined to hear is do not send money to
20 California, send it to Ohio, send it various
21 republican strongholds. Now what -- you know,
22 and that's -- as a solution to the trade war,
23 what they're trying to negotiate.

24 What happens to California in this trade
25 war with China, particularly if Trump succeeds in

1 really shifting investment and opportunity
2 between California and China into more the
3 Midwest?

4 MR. MICHAEL: So, yeah, there's a lot of
5 angles to that. Some of it is effects on
6 investment. Some of it is -- could be trades and
7 ports themselves. So I think maybe a piece of
8 the time on that, I mean, and I'm looking at
9 Cynthia about Chinese investment, but certainly
10 we see that in the Bay Area, observations there?

11 DR. KROLL: I think I'm more concerned
12 with what's happening with the Chinese economy
13 overall and Chinese demand than I am with Trump
14 administration efforts to divert Chinese
15 investments to other states. I think that that
16 Chinese demand is a significant part of the
17 growth of a number of our industries in the Bay
18 Area. And as that's slowing right now, that
19 could be one of the things that slows the growth
20 of demand for their products.

21 MR. KAMINS: This is Adam. I also wanted
22 to -- oh. I'm sorry. I wanted to add that I
23 think one of the things that we've looked at
24 nationally with Chinese investments flowing into
25 the U.S. is the impact on real estate markets.

1 And I think about the Bay Area market, for
2 example, that relies on a lot on Chinese capital.
3 And I don't know if the Trump administration's
4 efforts to divert investment to other states is
5 sort of the impetus for this.

6 But as, you know, sort of as mentioned,
7 as the Chinese economy slows and if the trade war
8 intensifies, I mean, that becomes a real worry
9 for real estate markets in gateway cities, and so
10 that could be a problem for a place like San
11 Francisco or Los Angeles.

12 DR. KROLL: So how much of that is buying
13 up property versus investing in building?
14 Because on the one side, it effects the price,
15 and prices going down might be good in the Bay
16 Area.

17 MR. KAMINS: Um-hmm.

18 DR. KROLL: And on the other side it
19 effects building which reduces supply.

20 MR. KAMINS: Right. No, I think, I mean,
21 it kind of impacts both channels, so you're
22 right. I mean, if you create some price relief,
23 that actually could be a good thing in the short
24 run. But I think on the whole it's, I mean, it
25 is a negative, especially because I would think

1 like, you know, the Bay Area, the housing market,
2 yes, there's supply shortages in that, that's
3 putting a lot of upward pressure on prices.
4 There's, you know, obviously demand. But because
5 it's -- you know, the unemployment rate is so low
6 already, because it's an economy that can run a
7 little bit hot and cold that, you know, you worry
8 that sort of a slowing economy in combination
9 with slower investment from overseas, that to me
10 becomes a worrisome formula.

11 MS. ASMUNDSON: Let me just add one other
12 thing. You know, I think the focus on the overall
13 amount of investment is probably correct. And
14 there are some subtleties about what happens and
15 where it's going.

16 But you know, even though I am
17 California, like if those places in the Midwest
18 started to do much better, California would also
19 do better because we are so tightly tied to how
20 well the U.S. is doing. And you know, I said
21 before, I have been worried about how slowly
22 growth has been spreading in these very urban
23 centers to sort of normal people. You need that
24 consumption base. You need lots of people in the
25 U.S. to do well. And so if that policy actually

1 sparked a lot of growth in the Midwest and had
2 those people do better I think, ultimately,
3 that's good for California. And it's not really
4 a zero-sum game because it would be a different
5 kind of investment. Unfortunately, I don't think
6 that it's very likely that the Trump
7 administration is going to have much of an impact
8 on Chinese decisions like that.

9 CHAIR WEISENMILLER: Actually, the last
10 question I have is just we've talked about the
11 economy and the differences, it seemed like we
12 have. How likely is it, the growth or separation
13 of, basically, two Californias going forward, the
14 sort of very affluent, very vibrant coastal areas
15 with lots of growth and more the inland, you
16 know, not quite west belt but, you know, sort of
17 Silicon Valley versus Fresno? You know, how much
18 are people worried about those trends? And is
19 there anything we can do to deal with that, to
20 make it more equality within California?

21 MR. MICHAEL: I'll make a little bit of
22 observation, is that, you know, the coastal
23 versus inland California, there are differences.
24 So there are parts of the inland areas like, for
25 instance, Sacramento and the north San Joaquin

1 Valley that are becoming more and more connected
2 to the coastal economy. So we've been talking a
3 lot in this region about the Northern California
4 megaregion. We're seeing these increasing
5 commuter flows. Now we've seen the Amazon and the
6 distribution logistics industry sort of decamp
7 inland. We're starting to look at other sorts of
8 industries that could spring out from that,
9 modular home construction being one of the
10 examples that people talk about.

11 So I think for some of these inland areas
12 that are proximate to the coastal areas that have
13 lagged behind, I think the answer to that is, you
14 know, improving the positive connections to the
15 coastal economy.

16 Other parts of inland areas, we've talked
17 about Northern California or deeper in the
18 valley, and Jerry bringing up an interesting
19 example of the Central Coast, a little bit harder
20 to build that connectivity. I'm not real
21 optimistic that high-speed rail would even do
22 that for Fresno. And so that becomes
23 challenging. And I think some of those areas,
24 too, are probably some of the areas that might
25 face some of the significant climate change

1 challenges that you were talking about earlier,
2 whether that's the agricultural or more resource-
3 based economies. The lower incomes could be
4 very, very challenged by it.

5 And so I think there's sort of, you know,
6 maybe another set of strategies we need to think
7 about for these areas where it's not sort of
8 realistic to build connections with the coastal
9 economy, or less realistic.

10 DR. KROLL: Well, you said most of what I
11 was going to say, but you did inspire some other
12 thoughts because one of my earlier iterations,
13 long before I came to ABAGNTC, I did a big study
14 on the Northern California timber region and how
15 that prospects were changing that. And I think
16 we face a real dilemma in that area right now
17 because of climate change. I mean, I think there
18 were areas within those changing economies where
19 people were moving in from the coast.

20 I can imagine now, with all of the
21 telecommunication options, that you could really
22 make it -- make some of these areas attractive
23 places for people to live and build businesses.
24 Not everybody's going to do that but there's
25 certainly a population within California that

1 would be interested in that, but at what cost in
2 terms of protecting those communities, building
3 them in a way that's safe, protecting the
4 environment in those communities, and then the
5 displacement of the people who are there?

6 So it's a challenging question.

7 MS. ASMUNDSON: One other thing that I
8 also wanted to mention is that inequality is not
9 just by region. And California is also very
10 much, you know, see homeless people everywhere in
11 the urban areas. There's still lots of people
12 who have sort of managed to hang on, who are
13 lower paid, who are lower skilled, who are kind
14 of living on the edge in these urban areas. And
15 so they might have access to the opportunities to
16 sort of like find a new job, but they also can
17 really get shut out.

18 And so it's not just a question of inland
19 versus coastal but it's also within each region,
20 you have to worry about inequality a little bit.

21 MR. MICHAEL: We have just a few more
22 minutes. So as a final question, I'm just going
23 to ask each panelist about if there's a major
24 demographic or economic trend that maybe people
25 are unaware of or that we haven't talked about

1 today that you think we'll be talking about more
2 in the future? That's a tough one off the cuff,
3 but Irena's --

4 MS. ASMUNDSON: I did mean to mention, so
5 over time, over sort of modern times we've had
6 increasing life expectancy which has kind of
7 stalled, actually, recently. And part of that is
8 that people are less healthy. There's a lot more
9 obesity. Part of that is opioids. So a lot of
10 that also speaks to inequality because for
11 wealthy people, life expectancy could -- for
12 educated people, life expectancy continues to
13 increase. For the less educated, the picture is
14 not looking good.

15 MR. MICHAEL: Rachel?

16 DR. CORTES: I'll try to follow that, but
17 we're all going to die. And thank you for having
18 me.

19 I guess I would just say in the work that
20 I've done at SanDAG the most kind of uplifting
21 part of it would be to see like the local
22 jurisdictions kind of willingness now to kind of
23 go back to the table and develop these units in
24 places that, hopefully, we'll see them built in
25 the near future. So I think things seem to be --

1 I've only been at SanDAG for four years and I can
2 kind of see a shift in people's thinking in that
3 area.

4 COMMISSIONER MCALLISTER: Are there any
5 particular jurisdictions that you would sort of
6 hold up as really thinking progressively or
7 innovatively about this?

8 DR. CORTES: Yeah. The City of San Diego
9 is very progressive. Chula Vista is very
10 progressive too. They're really willing to put
11 in a lot of residential and nonresidential
12 development, so I think they're getting a new
13 university in the south. It's kind of those
14 small coastal towns that are still really
15 resistant and like to tell us that they're
16 already built out. San Marcos also has a
17 university that's growing a lot, so they're going
18 to be taking in a lot of new multifamily
19 development.

20 So there's kind of a spread around the
21 whole county, but there's definitely places where
22 people are open to this and they're doing what
23 they can to get it done.

24 MR. MICHAEL: Adam, I want to give you a
25 chance to chime in with a final thought?

1 MR. KAMINS: Sure. Yeah. I think some
2 of the bigger trends or some of -- a lot of what
3 we've talked about was sort of the divide between
4 large dynamic areas or smaller areas. Maybe one
5 demographic trend that we're watching pretty
6 closely is that historically there is a bit of a
7 relationship between how the national economy is
8 doing, just the extent to which people move, that
9 when times are really good, when the unemployment
10 rate is low, you get more mobility across state
11 lines, which actually hurts California because,
12 right, when the economy is really strong and cost
13 differences matter more where there's a net
14 outflow of state-to-state migration would be
15 hurt. We haven't really seen that the last
16 couple of years now in the data where there
17 doesn't seem to be as much of a relationship
18 there.

19 So I mean, our working assumption is that
20 that sort of will return to normalcy to some
21 extent, that you're going to see this
22 relationship between economic strength and
23 overall migration reemerge a little bit. But I
24 think that's something that bears really close
25 watching and it could matter a lot for the

1 demographic picture in California.

2 MR. MICHAEL: All right. So, so far
3 we've got declining mobility. We've got some
4 declining life expectancy in certain groups. We
5 have a change in attitudes in some coastal
6 regions.

7 And so, Cynthia, you get the last word.

8 DR. KROLL: I guess my last word is watch
9 the millennials, that I think there's a tendency
10 to think -- to focus on what a generation is
11 doing and thinking of it as a generational
12 characteristic, they drive less, they like to
13 live in cities and so forth. I think we should
14 watch carefully what the oldest millennials do as
15 they move into their thirties and forties. Are
16 they going to revert back to what those H-cohorts
17 (phonetic) did or are they going to continue to
18 really bring a new style to urban and regional
19 development?

20 MR. MICHAEL: Well, I think we're on
21 time.

22 CHAIR WEISENMILLER: Excellent. Well, I
23 want to thank all of you.

24 And at the same time, I believe we're set
25 up for public comment now, so, okay.

1 MS. RAITT: Sorry. We provided the
2 opportunity for questions after each panel. So I
3 don't know if there are folks in the room that
4 had a question for our panelists? This would be
5 an opportunity to do that.

6 CHAIR WEISENMILLER: Please come up, Bob,
7 to the microphone and identify yourself.

8 MR. RAYMER: Thank you, Mr. Chair. Mr.
9 Chair, can you hear? Okay. Yeah. Bob Raymer
10 with the California Building Industry
11 Association. I'll be on the panel at one
12 o'clock, but I was listening. And I couldn't get
13 parking earlier today, so it's a crazy day out
14 there.

15 Anyway, for what it's worth, I've brought
16 our updated chart. This is basically what we've
17 been doing in both residential and single-family
18 home construction, dating back to 2004. And I
19 heard this morning there were projections of
20 perhaps 130,000 to 140,000 units total, both
21 multifamily and single-family for 2019, '20,
22 moving into '21. This afternoon, we'll talk
23 briefly about that's not happening.

24 I can tell you right now, and I spoke
25 with our statistician as I was leaving to make

1 sure nothing has changed, but we've seen a just
2 drop-to-the-floor reduction in permits that are
3 getting pulled in some of our major urban areas
4 where we would normally expect to see some robust
5 construction. We're seeing a reduction of
6 permits getting pulled at a level of about 50
7 percent. And I'll speak later today as to why
8 that's happening, but the short story is a lack
9 of finished lots, and enormous labor shortages
10 exacerbated by the fires and, of course, the
11 pricing pressure that you've talked to. We
12 expect in 2019 to do less units than we did this
13 year. And right now we're 2018, we'll have about
14 119,000 total units. And we'll do significantly
15 below that for 2019 and '20.

16 CHAIR WEISENMILLER: Do you know anything
17 about -- do you have a sense of the split between
18 single-family and multifamily --

19 MR. RAYMER: Yeah.

20 CHAIR WEISENMILLER: -- the trend there?

21 MR. RAYMER: Multifamily is still hanging
22 in there. Normally, if you go way back, '80s,
23 '90s, the 2000s, multifamily was about one-third,
24 single-family was about two-thirds. And then for
25 about five years it completely flip-flopped. As

1 we were coming out of the downturn, you know, the
2 2009-2010 period, we had about five or six years
3 where multifamily was doing two-thirds of our
4 construction. It's now sort of evened out.

5 But once again, as the panelists have
6 indicated, it depends where you're talking about.
7 What I am seeing is high-density single-family
8 home construction. Millennials, as they begin to
9 have children, sort of like the single-family,
10 you know, home that's kind of, sort of
11 segregated, but they're not having a problem with
12 high density which is helping keep the prices
13 down. And that's definitely coming on here in
14 Sacramento. If you're coming up 580 from the
15 49ers new stadium in Santa Clara, all of those
16 homes you see as you head north there to right of
17 the Shea Home projects or whatever, all of those
18 are three-story, single-family homes that are
19 within six feet of each other.

20 CHAIR WEISENMILLER: Wow. Yeah.

21 MR. RAYMER: So anyway --

22 CHAIR WEISENMILLER: So --

23 MR. RAYMER: -- I'll do more today, so --

24 CHAIR WEISENMILLER: -- the last question
25 for you here is my impression, trend-wise, is

1 that there's not as much development in the urban
2 cores, so it's basically people driving until
3 they hit affordability.

4 MR. RAYMER: Yes.

5 CHAIR WEISENMILLER: So I assume there's
6 more of that remote --

7 MR. RAYMER: And it's a problem. Number
8 one, I live in South Elk Grove. At least three
9 of the six families that live around me are
10 commuting every day to the Bay Area. And so
11 you're seeing that in Lathrop, Manteca, et
12 cetera. But Elk Grove, people are doing that
13 three-hour trek one way. And this is not --
14 that's not good.

15 And so anyway, I'll be here this
16 afternoon, we'll have more. Like I said, I
17 brought 100 charts, so on the way out --

18 CHAIR WEISENMILLER: Any other questions
19 from anyone in the room?

20 Please, come on up. Identify yourself.

21 MR. MARTINEZ: Ed Martinez with Southern
22 California Edison. I'll also be on the panel
23 this afternoon.

24 So as a panelist, I'll be kind of
25 interested to see, I guess the impact of sort the

1 first year on the cap on the state and local tax
2 deductions. And I think people now are finally
3 doing those tax returns now. And I'm wondering,
4 I guess, just any kind of guesses or insight into
5 that?

6 MS. ASMUNDSON: I think I'm supposed to
7 answer that question.

8 So in our forecast, we don't assume that
9 there is too much out-migration. The state
10 revenues are highly dependent on the top income
11 earners and those are the ones for whom this
12 limitation would apply to the most. So it could
13 be that we end up being very wrong about this,
14 but in our forecast we don't assume that those
15 people will often leave California.

16 MR. MICHAEL: Potential -- when this was
17 passed we were wondering about the impact on
18 housing demand because it's connected to mortgage
19 interest limits and your ability to deduct. So I
20 think it's one of the factors that is slowing a
21 little bit of the housing from the demand side.
22 But people -- I don't think the average person is
23 fully aware of it. Maybe they'll gain a little
24 bit more recognition this year as they're
25 completing their taxes. But I think most people

1 will be -- may not dig into the details unless
2 they see, you know, an increase in their taxes.
3 I think it will be relatively small for the
4 population.

5 MR. MARTINEZ: Thanks.

6 CHAIR WEISENMILLER: Chris?

7 MR. KAVALEC: Chris Kavalec, Energy
8 Commission. I guess this question would be for
9 Adam.

10 The panelists talked a little bit about
11 the logistics industry and warehousing supporting
12 online stores. And I was wondering if you had
13 any sense or anybody has any sense of whether
14 we're close to reaching an equilibrium between
15 online stores and brick and mortar, or are we
16 still like right in the middle of a shift to
17 online stores --

18 MR. KAMINS: Sure. Yeah, I can.

19 MR. KAVALEC: -- and so the --

20 MR. KAMINS: Yeah. I can talk about
21 that. I don't think we're near equilibrium. I
22 think if you look over a 15- or 20-year horizon,
23 there's actually data on online retail sales
24 versus traditional retail. And there's a pretty
25 steady half point to one percentage point

1 increase in the share of sales that the Census
2 Bureau classified as online every year. And if
3 anything, that's actually showing signs of
4 accelerating.

5 Now I think, you know, in terms of retail
6 space and just thinking about kind of, you know,
7 some kind of a property perspective, I think
8 retail is beginning to find its footing in some
9 ways. I think that there was this sort of
10 tectonic shift in terms of, you know, what the
11 retail world looked like. And I think in some
12 parts of the country, I think that's still an
13 issue where kind of traditional strip malls and
14 shopping centers are struggling, you know,
15 retailers like Sears and Target and others that
16 are still struggling under this new model.

17 But I think you are seeing maybe a little
18 bit more of a shift towards experiential retail
19 and where retail is kind of -- you know,
20 properties that we traditionally think of as
21 being retail where stuff is being sold as sort of
22 an experience, whether it's, you know, an eating
23 experience in a restaurant or other kind of
24 activity, is sort of taking over.

25 So all that's to say that I think there's

1 a lot more growth to come in the logistics
2 industry. But I also am not as worried about
3 sort of the doom and gloom that people are
4 talking about with retail outside of kind of a
5 few sectors.

6 MR. KAVALEC: Thanks Adam.

7 MR. KAMINS: Sure.

8 MS. ASMUNDSON: Can I add something? So
9 one other thing about the logistics and about
10 people buying stuff, I think Adam is right about
11 the experiential stuff. But if people are
12 commuting three hours each way twice a day, that
13 also leaves a lot less time to go shopping and
14 doing that traditional stuff. So I think that
15 those two trends interact and that you'll see
16 much more online.

17 MR. MICHAEL: I would say I think we're
18 very much just in the middle of a shift. I think
19 we haven't even reached 20 percent of consumer
20 spending online. It's been growing by about a
21 percentage point a year. I'm not quite sure
22 where it ends but I'm confident that there's a
23 lot more room to grown.

24 MS. RAITT: Okay. All right. If there
25 are no more questions in the room, and we don't

1 have any on WebEx, so then I think we can go
2 ahead and break. Back at 1:00?

3 CHAIR WEISENMILLER: Back at 1:00, yeah.
4 Thanks again.

5 (Off the record at 12:08 p.m.)

6 (On the record at 1:03 p.m.)

7 MS. RAITT: All right, I think we're
8 ready to start again, this workshop for IEPR
9 2019. And so we have Panel II which is on
10 Regional Economic Prospects for Business and
11 Industry. And our Moderator is Louis Bedsworth
12 from the Strategic Growth Council.

13 MS. BEDSWORTH: Okay. Thank you,
14 Heather.

15 Good afternoon everybody, Commissioners.
16 Happy to be here moderating this panel. We have
17 a lot of great speakers and a number of topics to
18 touch on. So I will say very little and just try
19 to, hopefully, help guide us through some of the
20 topics. But the goal of this panel is really to
21 provide a range of perspectives on economic
22 prospects for business, but also provide a sense
23 from a regional lens, as well.

24 So we've split the panel into two groups.
25 And we'll start off taking a more statewide

1 perspective. And then about 40, 45 minutes in,
2 we will switch and get some more regional
3 perspectives on the same set of questions. So
4 we'll run through the questions and folks will
5 jump in as they would like to answer, and maybe
6 some will skip over some.

7 But on this first panel, we've got three
8 great participants, Bob Raymer from the
9 California Building Industry Association, Tiffany
10 Roberts from the Western States Petroleum
11 Association, and Michael Shaw from the California
12 Manufacturers and Technology Association.

13 And so I guess we'll just start with the
14 big-picture question for each of you, which is
15 just to get your perspective on major trends that
16 you expect to see in your industry, in your
17 sector over the next ten years or so, you know,
18 and how you see that playing out at a statewide
19 scale? And also, you know, highlight if there
20 are any regional issues that we should be
21 focusing in on, on the next panel.

22 Do you want to start?

23 MR. RAYMER: I'll take it away. In terms
24 of major trends that have kind of already started
25 and going to increase in the coming years, for

1 residential construction, we're definitely seeing
2 high-density single-family home development sort
3 of take off in a big way. And this is -- we're
4 just going vertical. As long as the home has a
5 residential fire sprinkler in it, they can be
6 within six feet of each other. And sprinklers
7 are required in California, so effectively, all
8 single-family homes can do this, and they're
9 doing it in a big way.

10 Consequently, over about the last 10 to
11 15 years, we're now looking at over 80 percent of
12 the single-family homes that are built in
13 California are two and three stories tall. And
14 when it comes to infill, another major trend, and
15 this is a very good thing, is we're seeing the
16 first one to two floors are commercial. There's
17 a ton of mixed use going in. There's a lot of it
18 right here in Sacramento as you're coming into
19 town over there on the 20th Street exit. And
20 effectively, the first two floors will be
21 commercial. You usually have anywhere from three
22 to five floors above that. That's a relatively
23 easy construction to do.

24 Also, in terms of parking, we're seeing
25 limited onsite parking, and in some cases none,

1 where basically you're sort of left to deal with
2 the parking. And that's not a problem for the
3 millennials. And quite frankly, that's a major
4 target for these urbanized areas.

5 In terms of energy, new residential is
6 gearing up for either the onsite or offsite
7 renewable energy components. It's beginning to
8 look like the community solar approach may become
9 the compliance method of choice down the roads.
10 There's still a few hiccups that we need to
11 address in the IOU areas; we're identifying that.
12 But quite frankly, having a community solar, an
13 offsite solar facility, either within the same
14 climate zone or, who knows, 100 miles away, like
15 SMUD is considering, it's a very inexpensive way,
16 a lot cheaper than simply doing very small,
17 individualized renewable generation onsite home
18 after home after home. And so we're looking at a
19 variety of these approaches, but it looks like
20 that will be the method of choice down the road.

21 And a lot of jurisdictions, of course,
22 are beginning to look at promoting all-electric
23 construction which needs to be done with a lot of
24 care and coordination.

25 And so that sort of concludes my comments

1 on this one.

2 MS. ROBERTS: Good afternoon,
3 Commissioners. My name is Tiffany Roberts and
4 I'm with Western States Petroleum Association and
5 thank you for the opportunity to be here with you
6 today.

7 Just to note, also, we'll follow up this
8 conversation that we have today with some written
9 comments so that we make sure that we've captured
10 what we've provided here and maybe a little bit
11 more, as well.

12 So in terms of trends over the next
13 decade, I think really what we look at first and
14 foremost is the fuel consumption that is
15 currently taking place in the state of
16 California. As we know, compared to the rest of
17 the nation, California is a big fuel consumer and
18 will continue to be a big fuel consumer. And so
19 I think it's important to acknowledge that.
20 USEIA also acknowledges that even by 2040 the
21 nation's energy profile is still going to be made
22 up of roughly 80 percent fossil fuels.

23 And so as we look to put additional
24 regulations in place, especially when we think
25 about climate change policies, how do we put

1 those policies in place such that we don't create
2 distortions in the market? That's one of the
3 things that we at Western State Petroleum
4 Association actively engaged in, in looking at
5 ways to make sure that we can continue to inform
6 policies in a way that provides some economic
7 balance, along with balancing the environmental
8 outcomes that we'd like to achieve.

9 Another point to make, too, is that I
10 think you were all aware, we were actively
11 engaged in part of the cap and trade discussions
12 back in 2017. I think you'll start to see more
13 and more of that as other states consider climate
14 policy, as well.

15 So I think the takeaway that I would
16 encourage you to have, specifically from this
17 first question today, is that we are actively
18 engaged in that space. We want to be part of the
19 conversation and we want to help find good public
20 policy solutions.

21 MR. SHAW: Thank you, Commissioners.
22 Michael Shaw, California Manufacturers and
23 Technology Association. I, as well, appreciate
24 the opportunity to be here today.

25 I think it's important to note where we

1 are in terms of the cost of electricity and
2 natural gas. And you know, not to be a downer
3 here, but industry -- industrial customers on the
4 electric side are paying about 102 percent above
5 the national average for electricity costs.
6 Obviously, that varies to some degree across the
7 state. But it's important to note that because
8 when it comes to investment decisions, companies
9 are looking at those types of costs on a per-unit
10 production basis to help make decisions about
11 where they make future investments in the state.
12 And obviously, that has implications in terms of
13 job creation, state tax revenue, and a host of
14 other issues, as well. On the natural gas side,
15 we're about 92 percent above the national average
16 in natural gas prices.

17 So those are a couple of issues that
18 companies do consider. And it is important
19 because natural gas and electricity both play
20 important roles in manufacturing processes. We
21 see, for the foreseeable future, a significant
22 role of natural gas, as well. There are many
23 applications where electricity isn't the most
24 efficient method of heating or otherwise, you
25 know, treating in some way materials for

1 production. So that is an issue that we're very
2 sensitive to, as well.

3 As electrification pushes forward on a
4 number of fronts, primarily on the residential
5 side, you know, there are some potential concerns
6 or issues that the Commission, as well as our
7 elected leaders, you know, should be considering,
8 and that is the fact that the fewer customers
9 there are, the higher the transportation costs
10 ultimately end up being as a share of the price
11 of natural gas in that case. So those are --
12 that is an implication that we're also very
13 sensitive to because there are some, again,
14 applications that just don't work on the electric
15 in the manufacturing side.

16 Now we do see companies continually
17 pushing to identify ways that they can within,
18 you know, capital expenditures, capital
19 expenditures budgets, push for more efficient
20 operations, so that will continue to be an issue.
21 The impact to impact to the Cap and Trade Program
22 also plays a role in this, as Ms. Roberts
23 mentioned a moment ago, in that, you know, those
24 costs do transfer either directly through the
25 emissions of the process of the manufacturing

1 facility or indirectly through the price of
2 electricity and natural gas. So there's
3 different paths to hit -- not hit, excuse me.
4 There are different paths for those costs to pass
5 on to manufacturers in one way or the other. So
6 those are a couple of issues there.

7 We do also want to keep in mind that
8 California is well into an economic -- a growth
9 of economic -- a period of economic growth that
10 our former governor now, Governor Brown, had
11 reminded us repeatedly would not last forever.
12 That is something that we should be mindful of,
13 as well, because with those, with that
14 contraction potentially that might occur in the
15 future, that will significantly impact these
16 efforts or could significantly impact the efforts
17 to capital investments that would promote
18 greater, more efficient operations at
19 manufacturing facilities, as well.

20 So if you have revenue coming down, you
21 know, in terms of economic impacts, and costs
22 going up, it's a pretty bad path for future
23 investments in the state. So when considering
24 the future, we would hope that those
25 considerations would factor into the decisions.

1 I appreciate the time and look forward to
2 the rest of our discussion this morning -- this
3 afternoon, excuse me.

4 MS. BEDSWORTH: Great. Well, thank you
5 all. That was really helpful to hear. And I
6 think based on, you know, the things you all
7 touched on, I think it would be helpful to dive
8 in a little bit more on the regulatory and policy
9 environment, renewables was raised, cap and
10 trade. But I think if we start at a big picture,
11 thinking about how California's environmental
12 regulations can help to advance the state's
13 economy, and in your business sector in
14 particular, and then if I think there are
15 particular changes or updates that could help in
16 your sector?

17 MR. RAYMER: Thank you. Well, I'll go
18 ahead and kick that off. Bob Raymer, once again,
19 with CBIA.

20 In terms of the residential sector, some
21 of you may be aware that we're about to have a
22 solar mandate come 2020. All new homes are going
23 to have to have a renewable component in addition
24 to the energy efficiency component that we've
25 been updating every three years, and that's going

1 to be a challenge. Most of our major builders in
2 California are at least familiar with solar.
3 Some of them have been putting it on as a
4 standard feature for quite some time. But we
5 still have a lot of the smaller and medium-size
6 builders that need to get familiar with that.
7 We're working with the CEC, CALBO, the California
8 Building Officials, and a number of other
9 entities to get the word out, and it's going
10 quite well so far.

11 We also have three major policy drivers
12 that are taking place sort of simultaneously. Of
13 course, as I just mentioned, we're going to have
14 a lot of renewable energy going out into the
15 grid, you know, between ten o'clock in the
16 morning and three o'clock in the afternoon.
17 There's also, of course, the ongoing effort to
18 significantly increase EV charging, both at home
19 and at the place of business. And lastly, all of
20 this is sort of being exacerbated by the move
21 towards electrification.

22 And it goes without saying, and this was
23 picked up in an article by The Bee yesterday that
24 pretty much took up a full page, and that is all
25 of this needs to be worked out well with the

1 state agencies and the interested parties to make
2 sure that we don't accidentally start having grid
3 reliability issues, and that's a significant
4 concern. The good point here, last year, AB 3232
5 got passed. The CEC, of course, will be looking
6 into this. But it all comes at a time when we're
7 about to head into time-of-day or time-of-use
8 rates.

9 So the question is: As we're working on
10 that, what's going to happen when people, in the
11 summer of 2019 and in the summer of 2020, start
12 getting those bills, particularly in the older
13 homes, homes built in the 1960s and 1970s and,
14 quite frankly, in the '80s too? They're
15 significantly inefficient homes. And
16 unfortunately in the PG&E area a lot of them are
17 all electric and it was done all electric when
18 homes weren't being built very efficiently.

19 And so all of this is sort of going to
20 all kind of come together at once. And hopefully
21 working and playing well together, we'll be able
22 to get it right. So far I'm very optimistic
23 about that. We have a great relationship with
24 the Energy Commission. Looking forward to it.

25 MS. ROBERTS: On the regulatory front, I

1 mentioned climate policy earlier. And I think
2 we'll probably continue that theme, as well.
3 Like I mentioned, we've done a significant amount
4 of work on the Cap and Trade Program. And as you
5 know, the Air Resources Board just completed its
6 rulemaking package on 398 implementation. I
7 think by and large, there were some really good
8 things as part of that package. Obviously, there
9 were some things that we thought could have been
10 worked more, and maybe from a cost containment
11 perspective, really could have had a few better
12 outcomes.

13 But that said, I think the overarching
14 message that is important from an energy
15 perspective is that when we think about climate
16 policy and the role that it plays, the impacts
17 that it has on energy in the state, availability,
18 reliability and affordability, what we want to be
19 cognizant of is that there are interactions
20 between various climate programs. The Cap and
21 Trade Program and the Low Carbon Fuel Standard,
22 for example, are two that we've been very focused
23 on. So number one, that's an important
24 interaction to understand.

25 I do also want to highlight for you that

1 the Air Resources Board went through a big
2 rulemaking package on the Low Carbon Fuel
3 Standard. We were very active in that space.
4 And there were actually some things that, believe
5 or not, we appreciated as part of that rulemaking
6 package. I think whenever I said that to Sam Wade
7 a few months because in a public setting,
8 everybody laughed because it wasn't something
9 that really folks were expecting to hear. But
10 there were pieces of the Low Carbon Fuel Standard
11 rulemaking package that we particularly thought
12 were very good.

13 The Refinery Investment Credit Program is
14 a really good aspect of that rulemaking package.
15 We want to continue to work there to make sure
16 that those opportunities continue to become
17 available, and we will do that. I think we do
18 have that good standing relationship to be able
19 to continue those conversations.

20 Secondly, and I think what's interesting
21 from the CEC's perspective, is the focus on
22 carbon capture and sequestration and the
23 opportunity that it provides, not only today but
24 long term. There are CCS protocols as part of
25 the LCFS. We think that there are aspects of

1 that protocol that need some tweaks but overall
2 we're very excited to see that in there. And
3 we'd love to continue to have the conversation
4 with you all, as well, to see if there are
5 additional opportunities that we can open up
6 around CCS.

7 MR. SHAW: And I think Ms. Roberts
8 captured a number of the thoughts there. But we
9 also have, I mean, obviously, the implementation
10 of SB 100 and, you know, in various settings is
11 going to be something that will be, you know,
12 important, you know, how the -- how energy plays
13 out in the state of California. The expectation
14 that will hit, you know, the targets along the
15 way is something we're very interested in, as
16 well. Some of the flexibility that may or may
17 not exist within that program as it relates to
18 the types of energies that can fit into that last
19 40 percent, or the back 40, as you might say.
20 So those are a couple of things.

21 Cap and trade, as Ms. Roberts mentioned,
22 is also a significant component of things that
23 we're looking at going forward and how that plays
24 into California manufacturers and the costs that
25 we have for compliance.

1 You know, the options that exist for
2 reducing, you know, carbon in the atmosphere are
3 something that we're also very interested in.
4 Flexibility in making investments in offset
5 protocols or other things of that nature are also
6 very important to add to the carbon capture and
7 sequestration on that side of the equation. And
8 that's important because the opportunities that
9 exist outside -- inside California and outside
10 California are important to the global picture,
11 and really, that's we're talking about is the
12 global problem. I mean, we could literally shut
13 down every industry, get rid of all the people
14 and the animals and everything like that, and
15 we're not going to have a significant impact on
16 our own. It's only through our leadership and
17 investment in other parts of the world, really,
18 in addition to California that we're going to
19 have that significant impact.

20 So you know, you hear a different tone
21 from industry. Obviously, you know, we have also
22 the requirement, really, of living under the
23 mandates that currently exist and figuring out
24 how to continue to be successful in that
25 environment. So we are attempting to look

1 creatively at ways that we can meet those
2 obligations, as well as continue to make
3 investments in the state. But those were a
4 couple of the items I think I'd like to
5 highlight, in addition to the ones that were
6 mentioned previously.

7 MS. BEDSWORTH: Great. Thank you. I
8 think as we look at the changes and evolution of
9 the energy sector, another really important
10 piece, of course, are the state's energy
11 efficiency policies. I wonder if you all could
12 speak to how -- have energy efficiency policies
13 had a meaningful impact on your business sector?
14 And are there specific programs or elements of
15 the energy efficiency efforts that you'd like to
16 highlight?

17 MR. RAYMER: Yeah. That's near and dear
18 to my heart. It's been kind of a central focus
19 of my job going back to 1981. So, yes, the
20 energy efficiency standards have had a big impact
21 on our industry but you've been able to show
22 enormous efficiency and conservation savings for
23 the state of California. And that, quite
24 frankly, has proven quite well.

25 You'll notice, and again, whether or not

1 you have a copyright in this or not is a sad
2 thing, but at the national level so often what
3 goes on at the national code level is simply
4 mirroring a lot of what you've already done here
5 in California. And so having my foot in both of
6 those national and state arenas, this has
7 definitely proven very beneficial.

8 Looking to the future, one of the issues,
9 quite frankly, the CEC is already working on is
10 making sure that the requirements for the
11 residential HVAC changeouts in existing homes are
12 followed. And once again, as we're going to
13 time-of-use rates and you're in a home that was
14 built in the '70s or '80s, the last thing you
15 want to do is put a nice 14 or 15 SEER air
16 conditioner in your home and attach it to a duct
17 system that has a 50 percent leakage rate.

18 And the California Building Officials, as
19 you are probably aware, were looking at, in the
20 L.A. area, approximately 10,000 HVAC units that
21 were sold for residential units with only about
22 500 permits being pulled. That's a five percent
23 compliance rate. We're assuming that those that
24 did pull the permit complied with the CEC
25 requirement to check the duct system and make

1 sure that there wasn't leakage.

2 But I can tell you from personal
3 experience, we had a 2004 home. We put a brand
4 new air conditioner, this year, onto it. My
5 summer bill has dropped by \$200. It was amazing.
6 And so imagine what kind of an impact that's
7 going to have during time-of-use rates in PG&E
8 and Edison territory? It's fantastic.

9 Fortunately, with SB 1414, we're already
10 working with the Energy Commission to figure out
11 an unobtrusive way to try to get the product
12 suppliers linked up with the building officials
13 and make sure that the unit that gets sold here
14 and gets installed over there is done properly
15 and in compliance with the state law. So that
16 will be a big thing that we're working on with
17 the CEC, but the work has already started.

18 MS. ROBERTS: I'm actually going to defer
19 to my colleague from CMTA on the energy
20 efficiency part. I just feel like you probably
21 have a bit more space.

22 MR. SHAW: I appreciate that. You know,
23 so it's interesting thinking about this question
24 in particular. You know, manufacturers are on
25 both sides of this equation, we're both consumers

1 of, you know, machines and other process -- other
2 important pieces of technology in the production
3 process, but we're also manufacturers of the
4 products that then are sold to consumers.

5 So we both deal with the energy
6 efficiency question on the front end in terms of
7 what we do and how we do it, and then on the back
8 end in terms of selling it to others who then,
9 you know, have to purchase products that meet
10 certain qualifications of otherwise incentivize
11 to purchase, you know, projects that meet, you
12 know, such as an HVAC system or a television or a
13 refrigerator, you know, of that nature. So those
14 are important, you know, concerns for us.

15 Really, on the front end of it we have,
16 obviously, the cost of those installations and
17 the capital expenditure because typically, in the
18 case of a manufacturer, you're purchasing
19 something with the expectation that you'll have
20 many years or at least some number of years of
21 use of that particular machine, computer, other
22 piece of technology in the manufacturing process.
23 On the other hand, on the production side, you
24 know, meeting some of those efficiency challenges
25 in the products that we sell to consumers is also

1 an issue that pushes companies to be more
2 creative and pursue new technologies to invest a
3 good amount of money in research and development.
4 So it is both -- challenges on both sides of that
5 equation.

6 I think energy efficiency programs, you
7 know, that exist today, you know, have
8 benefitted, in some cases, manufacturers and
9 also, you know, been a challenge for them to
10 meet. So you know, as you go forward in pursuing
11 new programs on the energy efficiency side, I
12 know that you keep these things in mind. I know
13 that, you know, Commissioner McAllister, in
14 particular, you know, we've talked in the past
15 about energy efficiency, you know, as an issue
16 that is important to manufacturers. And you
17 know, we do, you know, whether it's computers
18 and, you know, Intel and other companies that are
19 producing those products or manufacturers on the
20 other side who are making, you know, airplane
21 components or petroleum products even, you know,
22 these are -- we appreciate the opportunity to be
23 a part of those discussions, so --

24 MS. BEDSWORTH: Great. Thank you, all.

25 So now that we've talked a little bit

1 about the regulatory and the policy environment,
2 I know there were a couple of questions sort of
3 looking ahead in the future.

4 And so just to start, I guess a question
5 around areas you see for new for new investment
6 in your sector. Sort of are there new activities
7 or new investments that you're anticipating?

8 MR. RAYMER: Oh, big time. For
9 residential, energy storage is going to be huge
10 in the coming years. And I'm thinking back now.
11 Initially, when we were working with the
12 Commission on getting the Battery Compliance
13 Credit for the next set of standards, we were
14 just -- we're always looking for innovative ways
15 to leave a lot of freedom to the builder to get
16 to the end goal but figure out how to do it. But
17 in addition to helping meet the total renewable
18 goal, I'm thinking this is a two-fer. Where
19 putting that onsite battery is not only going to
20 kind of be a hedge against the time-of-use rates,
21 you're going to be able to keep the cheap solar
22 power onsite. But the fact of the matter is it's
23 really going to help the utilities and the state
24 with grid harmonization, no question about it.

25 And we already have major builders who

1 are already experiencing problems getting their
2 hands on this, which is a great thing. They're
3 looking at early compliance with the 2020 regs
4 and we're finding problems getting our hands on
5 enough of the batteries for the long-term cells.

6 Other areas that we're seeing are onsite
7 water recycling on a house-by-house basis.
8 There's a lot of new and innovative technology
9 there and it's getting cheaper.

10 Module construction is picking up again
11 where significant components of a house are
12 basically built in a factory. You have very
13 little waste when you're doing it that way. It's
14 trucked to site. The biggest issue that we're
15 trying to get is how to get it from point A to
16 point B, that's always been the case in the past.

17 And lastly, smart phone technology, being
18 able to use this to control the security, the
19 energy consumption of the house, turn off the
20 lights in the bedroom, it's working great. But
21 we've got to be able to teach people, including
22 myself, how to use it properly.

23 MS. ROBERTS: I think in terms of
24 investment, one of the things that we would want
25 to highlight is the investment that's already

1 taken place, specifically on the upstream side
2 when we think about production. And we don't
3 want folks to forget the fact that the investment
4 made in new ways to produce oil and natural gas
5 actually resulted in a natural gas renaissance in
6 this country.

7 I think the reason that's important,
8 especially for California, is the fact that when
9 you look nationwide, not only nationwide but
10 worldwide, at emissions profiles of the U.S.
11 relative to other countries, what we see is
12 because of that renaissance in natural gas
13 production, we've had fuel switching back east.
14 And that has allowed for us to reduce greenhouse
15 gas emissions across the country.

16 I think that's a very important thing to
17 note because as we continue to be concerned about
18 greenhouse gas emissions and finding innovative
19 ways to reduce them, we don't want to forego the
20 opportunity in the oil and natural gas sector to
21 reduce those and recognize the contribution
22 that's being made there.

23 I would say, also, on the refining side,
24 as well, we don't want to forego opportunities to
25 do refinery investments such that we would have

1 additional energy savings. I know sometimes the
2 permitting process can get -- maybe hamper that
3 ability. And so I think just being cognizant of
4 the fact that there are potential opportunities
5 but at the same time that, sometimes due to CEQA
6 permitting issues, we may run into potential
7 problems there. And trying to sort through what
8 those problems are and finding a workable
9 solution is going to be important.

10 MR. SHAW: Very good question on future
11 investments. I think, as I noted earlier, I
12 mean, capital expenditure budgets are limited.
13 And you know, for a variety of reasons,
14 California is a challenging place to make those
15 investments for some companies, for many
16 companies, I should say. So that is not an
17 impossibility but it is something that is
18 difficult.

19 Future investments, I mean, you know,
20 California manufacturers and, really,
21 manufacturers worldwide are continually looking
22 for ways to improve their processes and be more
23 efficient. Energy, you know, either as natural
24 gas or electricity is an input in these
25 processes. And so they want to find ways to use

1 less. It's in their best interest. In many
2 cases, it is a larger expenditure for
3 manufacturers than labor or other cost categories
4 would be. So they are looking to make those
5 investments.

6 But they also need to know that there's a
7 payout in the end. They need to know that it's
8 going to save them more than it's going to cost
9 them to make some investments, and it needs to
10 happen in, you know, a relatively short period of
11 time, on the magnitude of several years versus
12 15, 20 years, which that would never pencil out,
13 really, in a manufacturing context for a capital
14 investment of the nature.

15 So I would encourage you, as you're
16 looking at future efforts, to incentivize, you
17 know, energy efficiency. The short timeframes
18 are important on the return on investment. And
19 I'm sure, you know, you well know that. But it
20 is something that's increasingly challenging.
21 And the outside factors out of your control, you
22 know, do impact those decisions, as well. And
23 that's, unfortunately, something that you can't
24 influence, even if you're pushing for that, is
25 the tax and other regulatory environment and

1 labor environment in California, the availability
2 of skilled workers to meet, you know, the demands
3 of an increasingly technological manufacturing
4 sector, both in terms of what we produce, but
5 also how we produce it. So those factors are
6 something to keep in mind.

7 But on that last point, actually, a
8 moment of inspiration here perhaps, but something
9 for you also to look at is the skilled workforce
10 because we do have increasingly, you know,
11 technologically advanced manufacturing processes
12 taking place, producing even some of the simple
13 things that we used to do manually or by hand in
14 the past, we will need people to do that. And I
15 do believe that it's appropriate, you know, for
16 the Energy Commission here to consider those as
17 those programs go forward because we will need to
18 train those workers to fill those roles.

19 Otherwise, we can buy the nice, expensive, super
20 energy efficient machine and, you know, we've got
21 a really expensive and very large paperweight.

22 MS. BEDSWORTH: Great. Thanks. So I
23 know we're trying to get through a lot in a quick
24 period of time.

25 But building on that, I guess, I'd ask if

1 there are significant uncertainties facing your
2 sector?

3 MR. RAYMER: Yes. Yes, there are. And I
4 don't mean to be Bobby Bummer here, but we've got
5 some challenges right now.

6 You know, if you go back a couple of
7 years, there was already a national labor
8 shortage. California was sort of ground zero for
9 that, as well. Now keep in mind what's happened
10 over the last 18 months with the Napa fires and
11 the Paradise fires. We lost, in 18 months, over
12 20,000 dwellings, homes and apartments, and these
13 need to be rebuilt.

14 And the question arises, in order to be
15 able to go forward and fix that, you need -- the
16 builder needs to be able to get a commitment on
17 labor, a commitment on materials at a given
18 price, and the people who need to rebuild need a
19 commitment from the insurance company of what
20 exactly, what is that number that they're going
21 to be given? And to this day there is still a
22 significant amount of debate going back between
23 insurance companies and the Napa fire victims as
24 to what that amount is, and it's going to be even
25 worse with paradise. So this is a huge problem.

1 And as I mentioned, one of the other
2 commitments we need is will we be able to get
3 that wood or that solar for a particular price a
4 year, a year-and-a-half down the road? We don't
5 make the product purchase agreements tomorrow for
6 a home that we're going to build next week. We
7 try to get all of this stuff planned ahead a
8 year, year-and-a-half ahead, and that's where the
9 tariffs come in.

10 And a problem with the tariffs is that --
11 is twofold. Eventually, you will see a price
12 increase down the road. But I think the more
13 immediate impact is the uncertainty, that once
14 somebody says, oh, I want a tariff on solar, I
15 want to put a tariff on wood from Canada, all of
16 a sudden the product suppliers, you've got the
17 manufacturers of a product, you've got the
18 supplier chain, and you've got the end result
19 where it gets used, and in the supply chain, they
20 don't want to make commitments to get us wood at
21 a certain price, solar at a certain price, if up
22 here they don't know what it's going to be. And
23 so let alone whether the trade wars are going to
24 have any positive impact down the road, it's
25 having a very negative impact on the front end

1 because of the uncertainty that pops up here.

2 Lastly and something that wasn't
3 discussed this morning, with residential
4 construction, whether it's apartments or single-
5 family homes, as we're building out we need to
6 plan ahead and we need finished lots. And that's
7 where you've gone in, the land gets developed,
8 streets are being put in, utility line extensions
9 are being put in, and that's where major
10 developers are basically selling off major parcel
11 lottage (phonetic), you know, 500, 1,000 lots
12 over here that a builder can come in and then
13 construct the homes or whatever. The
14 availability of finished lots in California has
15 dropped through the floor. And it takes years and
16 years, and I'm saying decades, to get a major
17 product off and running.

18 Newhall Ranch, a very sort of in the news
19 these days project in Southern California.
20 Ultimately, it's going to have 23,000 single-
21 family and multifamily dwellings, a lot of mixed
22 use, et cetera. It took them 30 years. I had
23 brown hair when they started that, so -- and the
24 same goes for, you know, Tejon Ranch which is
25 just now getting approval.

1 When you have to spend decades moving
2 this forward, this creates a snowball effect.
3 And so we've got some serious challenges that
4 we're going to have to be working on in the
5 coming years. The good news here is Governor
6 Newsom seems to be more than up for the challenge
7 and has a very robust goal that he wants us to
8 seek out there, and so we'll be working with him
9 to try to affect that.

10 MS. ROBERTS: I think there's probably a
11 lot we could say in this space but I am going to
12 try to keep it brief.

13 On the regulatory side, I think there's
14 always going to be considerations around cost.
15 How do we make sure that we contain cost on the
16 carbon side as we continue to see either
17 additional regulations added on to the current
18 scope of regulations or we see those regulations
19 that are currently in place start to tighten? So
20 how does the state ensure adequate cost
21 containment?

22 Specifically for us, I would look to the
23 low-carbon fuel standard questions around
24 feasibility and what that means in terms of being
25 able to essentially provide fuel to the state in

1 a way that doesn't essentially disrupt consumers'
2 ability to ensure they've got cost-effective
3 gasoline, if you will? So that is one issue.

4 I would say the other issue, too, and I
5 would commend this body for having looked at this
6 in the past, is the connection between the
7 electricity sector and the transportation sector.
8 I know a few years ago in the 2017 IEPR there
9 were considerations around reliability and what
10 that would mean on the transportation side if we
11 do lose reliability. I would encourage this body
12 to encourage to continue to think about that. To
13 the extent that we have any type of electricity
14 reliability concerns, that certainly impacts the
15 state's ability to produce refined gasoline and
16 diesel. And so continuing to keep an eye on that
17 and really understand dynamics between the two
18 sectors is very important.

19 MR. SHAW: Economic uncertainty, as well.
20 Yeah, I think I mentioned earlier, you know,
21 obviously the -- some point in the near --
22 relatively near future, it seems, you know, we
23 can expect some kind of economic, you know,
24 contractions of some kind. Obviously, I think as
25 Mr. Raymer mentioned, you know, the international

1 trade picture, you know, plays a role, as well,
2 particularly in California where a great number
3 of our products, you know, ultimately end up
4 going overseas somewhere. You know, we are a
5 significant exporter. We have, you know, the
6 largest, well, two of the largest ports in the
7 country, in particular, which is a great benefit
8 to us, plus our agricultural products which, you
9 know, in many cases go through some type of
10 manufacturing, as well, you know, ultimately end
11 up going to other parts of the country and the
12 world.

13 So -- but the economic impacts and what's
14 happening in Europe currently certainly is
15 something that can play into that picture. What,
16 you know, tensions with the other countries,
17 China, Russian, et cetera might, you know, play a
18 picture -- or would certainly impact that, as
19 well.

20 But I think also, you know, in addition
21 to that we have just the general regulatory
22 environment in California that is, I'd say,
23 disincentive in some cases for companies to make
24 investments in California. And I don't
25 necessarily say that because it is a costly place

1 to comply with the regulation; that is part of
2 it. But another large part of it when you talk
3 about economic uncertainty, the regulatory
4 uncertainty is also a big issue. Companies make
5 investments, they expect, again, to have some
6 period of payout on that investment, and
7 California continues to push, you know, beyond
8 where we are.

9 And that has created some uncertainty on
10 the compliance side which then begs the question:
11 How long is my investment going to be hanging out
12 in the state versus how soon am I going to have
13 to replace it because California changed the
14 standard again? Again, that's not to say that
15 California shouldn't be incentivizing, you know,
16 those investments. But the mandatory compliance
17 aspects of it do create some uncertainty, as
18 well.

19 And so we've gone through this most
20 recently with cap and trade and the impact that
21 that has. You know, companies, you know, who
22 were facing the prospect of significant
23 reductions in the industry assistance or the
24 allowances that are allocated to them to help
25 them comply and mitigate the risk of leakage, you

1 know, they, fortunately under the leadership of
2 Governor Brown and the legislature and Ms.
3 Nichols at the Air Board, Chairwoman Nichols, you
4 know, do see the benefit of that, you know, at
5 100 percent for the remainder of the program as
6 it's been authorized thus far.

7 So there are things that have -- there
8 are uncertainties that exist. There, of course,
9 are the things that we just can't imagine that
10 will happen yet. But then there are things that
11 we do have more control over. And I would just
12 encourage you as you look at, again, you know,
13 implementing various programs through the CEC or
14 colleagues at the PUC and other regulatory
15 agencies of various stripes would consider that,
16 as well.

17 MS. BEDSWORTH: Before we, excuse me,
18 wrap up this part of the panel, I wanted to make
19 sure that --

20 CHAIR WEISENMILLER: Yeah.

21 MS. BEDSWORTH: -- we provided some time
22 for the Commissioners to --

23 CHAIR WEISENMILLER: I wanted to go back
24 to Rob's comment about hiccups in the community
25 solar and give him a chance to explain that.

1 MR. RAYMER: Sure. Excuse me. As we're
2 implementing something like that, this is a
3 quantum leap in building codes. You don't
4 normally see such a major change happen
5 relatively quickly. And I know that we've been
6 working on this for a decade. But the fact here,
7 the effective date is right around the corner.

8 And number one, the smaller and medium-
9 sized builders that are out there, they have to
10 be able to -- if they're not going to do a
11 community solar project, hopefully through the
12 utility, they're going to have to be able to get
13 their hands on the material. So in essence, if
14 they don't already have an established
15 relationship with a solar company, they need to
16 get one. They need to get one last week.

17 They also have to be able to start
18 working on product purchase agreements for homes
19 that they've got in the pipeline. And with that,
20 they need to be able to get that commitment of
21 what that solar is going to cost. You're hoping
22 to get it to where you can ultimately sell it to
23 the homebuyer for about \$2,500 to \$3,000 a
24 kilowatt. Thanks to tariffs, all of this is kind
25 of up in the air. And who's to say that, you

1 know, a large builder will come in and get a huge
2 amount of product, where does that leave the
3 small and medium sized?

4 And so once again, there needs to be a
5 general understanding within the regulatory arena
6 that us out in the private sector are about to
7 take an enormous step very quickly. And I think
8 there's an understanding of that, particularly
9 with Commissioner Hochschild and Commissioner
10 McAllister, that as we go about developing the
11 next set of standards, you going to be giving a
12 breather onto new residential as you focus on the
13 existing housing stock and commercial and
14 whatnot, and that's well deserved because we're
15 going to be busy.

16 And we need to get this right because,
17 quite frankly, you've got 49 other states that
18 are looking at us. Some would love to see us
19 fail. Others want to see, well, what did happen
20 there that we want to make sure we don't do? And
21 the important thing is let's just get it right so
22 those that want to be detract don't have anything
23 to say and those that are looking for a way to do
24 it can say, well, let's do it like California
25 did.

1 So it's tough. We're going to do it.

2 CHAIR WEISENMILLER: And, Tiffany, I just
3 wanted to ask in terms of assuming we meet
4 Governor Brown's targets for zero-emission
5 vehicles, what does that do to the refining
6 industry in California?

7 MS. ROBERTS: I mean, I think it's a
8 great question. And I would also look at some of
9 the forecasts around zero-emission vehicle
10 penetration, as well. I do think that, frankly,
11 the state has a tough hill to climb when it comes
12 to meeting some of those targets.

13 That said, we also have to look at the
14 signals that it sends the market, both in terms
15 of investment, short term, as well as investment,
16 long term, and be cognizant of that. How much of
17 a market are you going to have here in
18 California? Certainly, we believe that there
19 will continue to be a market.

20 I think again, I mean, I mentioned early
21 in my statement that California is one of the
22 largest fuel-consuming states and entities on the
23 planet, so there will continue to be a market. I
24 think what we have to be cognizant of is what's
25 the marginal impact associated with additional

1 zero-emission vehicle penetration and the signals
2 that it sends to individual companies and
3 investors? I can't speak to any one company's
4 potential for making investments in the future.
5 But I can tell you that people are concerned
6 about what that means for the future.

7 COMMISSIONER HOCHSCHILD: Can I just
8 follow up with you? I'm just curious if you have
9 an assessment, I mean, with takeover for zero-
10 emission vehicles is 5 million by 2030. And as
11 you know, we were selling 6,000 a month in
12 California a year ago. We're now to 25,000 a
13 month. Is the -- do you have a projection of
14 what you think is more realistic in terms of
15 where it could go?

16 MS. ROBERTS: That's a very good
17 question. And certainly I think, you know, there
18 are individual companies who could be potentially
19 looking at that. We have not looked at that
20 analysis yet. I think we've just looked at the
21 forecast relative to what we've seen actually
22 come to pass. And we do have some questions
23 about the potential to realize those numbers.

24 I'd be happy to talk further with you
25 offline to think about what that analysis could

1 look like because I do think it's an important
2 question.

3 COMMISSIONER HOCHSCHILD: Thank you.

4 COMMISSIONER MCALLISTER: Michael, I
5 wanted to ask you a question. So I think, you
6 know, I agree with you that the program
7 environment has been kind of a little bit
8 underbaked for, you know, industrial. We've been
9 working on ag and sort of, you know, SB 350 does
10 require us to work with -- to find solutions in
11 the industrial sector, as well. You know, it's
12 one of the key sectors for emissions reduction.

13 I'm wondering if you have any sense yet
14 of what implementation of the Hertzberg bill from
15 last year, 1131, might result in for you and your
16 members, or just more broadly, you know, think
17 about solutions? What would a programmatic
18 structure look like that would get at -- would
19 incentivize, you know, the right moves, relevant
20 moves effectively, you know, in a relevant way
21 that didn't get in your way?

22 MR. SHAW: That's an excellent question.
23 You know, Senator Herztberg got a couple of
24 bills. Sorry, it took me a moment to sort out
25 the numbers there.

1 COMMISSIONER MCALLISTER: No. Sorry.

2 This is the one that includes industrial
3 explicitly in the program environment.

4 MR. SHAW: Yeah. No. No. And I
5 appreciate you stringing the question out there a
6 little bit to give my moment to catch up and
7 refresh there.

8 No, it's important, you know, to make
9 sure that we have programs in place for the
10 industrial sectors. You know, I mean, it is, I
11 mean, one of the largest, you know, users, some
12 of the largest users of electricity. I'd say the
13 largest users of electricity are certainly, you
14 know, in that -- in our sector, so finding ways
15 to incentivize that is important. And giving
16 them access to some of those energy efficiency
17 dollars is critical to do that.

18 You know, anything that can be done to
19 help defer on some level or reduce the costs of
20 making those investments is -- you know, really
21 gets down to that issue of the return on
22 investment and the bottom line, and the capital
23 expenditure budgets are limited. So you know,
24 that program, you know, will help, we believe,
25 and that's why we supported, you know, that

1 particular piece of legislation to help get
2 there.

3 Looking at potentially cross, I don't
4 want to say pollination is not the right word,
5 but just cross benefits, really, between
6 programs, there may be something that we could
7 look at. I know that there's been discussion of
8 different programs, LCFS and Cap and Trade and,
9 you know, different things in the past. I'm not
10 necessarily suggesting that that's one to pursue.
11 But if there's a way to find, you know, between
12 programs, some benefits, if you do something here
13 you get a benefit over there, as well, that might
14 be an opportunity for us to pursue.

15 But ultimately it comes down to that
16 bottom line and what is going to help reduce the
17 cost of making that investment or finding some
18 way for that investment to pay out in other
19 scenarios, so again, if there's that cross
20 benefit between programs, you know, something
21 along those lines.

22 That also has the side benefit, I think,
23 of making compliance a little bit easier in some
24 places. Where this is more cost-effective
25 compliance on one side, you know, maybe that's

1 the place where you put the -- make your
2 investments versus another area, too.

3 So there's a couple of different
4 opportunities I think we could pursue in that
5 context.

6 CHAIR WEISENMILLER: So one last question
7 for Tiffany.

8 You had mentioned originally the
9 relationship between LCFS and carbon capture and
10 storage. Do you have specific ways to state to
11 help move that forward, other than the LCFS regs?

12 MS. ROBERTS: Yeah. I mean, I think the
13 LCFS reg is the natural place to start because
14 they've already included a protocol in that
15 rulemaking package. I would say we should be
16 having more conversation around what those
17 opportunities look like. I can tell you that our
18 industry is very excited about CCS, the prospect
19 of CCS long term. And I think that's a very good
20 conversation to start having. What do those
21 additional opportunities look like, especially in
22 the, you know, the 2040s, 2050s, that type of
23 time span?

24 In terms of specific projects, certainly
25 wouldn't be able to comment today about any type

1 of specific project. But I think what's most
2 important is to note that that is an area that we
3 continue to watch and continue to believe that
4 there's an opportunity there, for sure.

5 CHAIR WEISENMILLER: No, well, good.
6 Because obviously, there's quite a lot of
7 interest in reducing carbon intensity of the
8 enhanced oil production.

9 MR. SHAW: If I could -- I apologize,
10 Commissioner McAllister. I did want to add one
11 note to your -- my answer to your prior question.

12 The issue that we face going into making
13 use of those industrial energy efficiency
14 dollars, you know, as you well know, dealt a lot
15 with the standards against which we -- or the
16 metrics against which we were based. So the
17 benefit, you know, we hope to see come out of
18 1131 is that there will be a more defined
19 standard and not a moving target. And that was
20 the challenge that we faced under the prior
21 program. So we hope that that will, you know,
22 that that will be clear, you know, to the
23 companies.

24 And I think the clarity is very critical
25 in making sure that they have the confidence in

1 making the investment of going through the
2 process of applying for those funds and getting
3 the certifications, et cetera, that go along with
4 that.

5 So we'd appreciate, you know, your
6 leadership in that area, as well.

7 MS. BEDSWORTH: Well, thank you, all,
8 very much. I appreciate that.

9 MS. RAITT: Okay. Thank you. So this is
10 Heather Raitt. And we'll shift to the regional
11 perspective. So the panelists can come up to the
12 tables and we'll have a place for you.

13 And, Jeff, can you hear me?

14 COMMISSIONER SCOTT: Heather?

15 MS. RAITT: Yeah?

16 COMMISSIONER SCOTT: Before you get
17 going, this is Commissioner Scott --

18 MS. RAITT: Okay.

19 COMMISSIONER SCOTT: -- I don't know if
20 we wanted to see if there were any questions for
21 Part A of this Panel 2 here? Sorry.

22 MS. RAITT: So I don't know if folks in
23 the room had questions of Part A of the panel?

24 COMMISSIONER SCOTT: Okay. It doesn't
25 look like it. Thanks.

1 MS. RAITT: Okay.

2 COMMISSIONER SCOTT: Thanks.

3 MS. RAITT: So I believe that we're ready
4 to go on?

5 MS. BEDSWORTH: Move ahead? Okay.

6 MS. RAITT: Go ahead.

7 MS. BEDSWORTH: All right. So we'll move
8 into the second part of the panel, providing more
9 of a regional perspective. And I believe we have
10 Jeff Bellisario from the Bay Area Council on
11 WebEx. And then we're joined by John Cho from
12 Southern California Association of Governments,
13 Tracy Egoscue from the Port of Long Beach
14 Commissioner, Cyndee Fang from San Diego Gas and
15 Electric, Eduardo Martinez from Southern
16 California Edison, Tim McRae from the Silicon
17 Valley Leadership Group, and Karen Mills from the
18 California Farm Bureau, so a nice range of
19 regions to hear from.

20 And I know that some of you have topics
21 you want to spend a little more time on than
22 others, so we'll sort of, we'll go through a
23 similar set of questions, starting again with
24 hearing from each of you in your region and then
25 also -- within your region and/or within the

1 sector in which you work in your region, just get
2 your point of view on major trends that you
3 expect to see over the next ten years or so. And
4 you know, and if there are unique situations or
5 circumstances to be considered in your region, it
6 would be helpful to highlight those and maybe go
7 through that quickly, and then we can turn our
8 attention to talking more about their regulation
9 and policy environment.

10 And so maybe we'll just go right down
11 starting here.

12 John?

13 MR. CHO: Good afternoon. My name is
14 John Cho, a Senior Regional Planner at the
15 Southern California Association of Governments.
16 I'm pleased to be here and share what SCAG is
17 doing.

18 SCAG, as an NPO, produce regional close
19 focused. We expect to see in the next ten years
20 slow economic growth, low fertility rate, and
21 higher share of old population. In ten years,
22 baby boomers will completely move into 65 years
23 and older. And 65 percent of all population
24 growth will be for the age of 65 and above. And
25 we expect to see more out-migration. In 2006, 20

1 percent of the out-migrations noted that their
2 reason for moving was housing related. After ten
3 years, it increased to 37 percent. So with
4 increasing housing costs, we expect to see the
5 continuing migration.

6 And we also expect to see automation.
7 McKinsey and Associates predict that in ten years
8 about 23 percent of existing jobs can be
9 automated. So some jobs can be declined, some
10 jobs can increase, and some jobs that we don't
11 know yet will be created. So we see that
12 education and transition of educating the
13 workforce to get the new jobs will be important.

14 MS. EGOSCUE: Thank you. Tracy Egoscue,
15 Port of Long Beach. Good afternoon. Thank you
16 so much of the invitation, both to the Chair,
17 Members of the Commission, and also to the staff
18 for this afternoon. I've been here all day and I
19 am honored to be part of these expert panels,
20 both this morning and this afternoon. I'm going
21 to be very brief because we have such an esteemed
22 panel that joins us.

23 But from the Port of Long Beach's
24 perspective, our all-electrical terminal in
25 Middle Harbor, which is entering into its third

1 phase, uses approximately four times electricity
2 as a normal terminal. So for us being moved
3 towards electrification of terminals has
4 increased the demand on the infrastructure. We
5 are Edison's largest regional customer, and
6 without innovative strategies and support, both
7 from the state, including this Commission, thank
8 you very much, and also CARB, and also our
9 regional partners, we have quite a road ahead of
10 us in the next ten years to meet our zero-
11 emission -- near-zero-emission goals.

12 Thank you.

13 MS. FANG: Cyndee Fang from San Diego Gas
14 and Electric. And thank you for the opportunity
15 to participate in this workshop.

16 What I see are three big trends. First,
17 obviously, the state policies to reduce GHG
18 emissions, increase renewables, and the
19 aspirational goal of getting to carbon-neutral.
20 In addition, the growth and expansion of CCAs
21 will dramatically change the relationship of the
22 utility with our customers, as well as just the
23 nature of the utilities themselves.

24 Also, as far as general trends that we
25 see, what we see is over the last couple of

1 years, and we expect this to continue, declining
2 use per customer. And this ends up being
3 something that we see on the electric side, on
4 the gas side, residential, nonresidential. And
5 that does have significant implications,
6 especially when we look at what this means to
7 rates. So even with costs being flat, you know,
8 when we've got declining use per customer, the
9 rates are going to go up. And so this does have
10 significant implication as far as, you know,
11 being an important upward right pressure.

12 COMMISSIONER MCALLISTER: Do you mean
13 declining sales for customers or --

14 MS. FANG: So we have declining use per
15 customer. And our customer growth is slowing, so
16 it does result in overall being a declining sales
17 in general at the system level.

18 COMMISSIONER MCALLISTER: Okay.

19 MS. FANG: But the behind-the-scenes
20 driver is how our customers are using energy.

21 COMMISSIONER MCALLISTER: Okay.

22 MR. MARTINEZ: Eduardo Martinez from
23 Southern California Edison. I can actually echo
24 a lot of the comments from Cyndee.

25 I want to reiterate a little bit some of

1 the regional patterns that were identified this
2 morning. We do see the So Cal economy reaching
3 the mature phase of expansion. Job growth is
4 still positive year-over-year, however, each
5 month that year-over-year increase is continuing
6 to decline again, showing evidence of a slowdown
7 in that expansion, not quite a recession.

8 We're heavy users of the BIA data, the
9 permit data. We actually have seen, when you
10 take a look at just the service territory, when
11 you take out LADWP, the City of Anaheim, City of
12 Riverside, single-family has exceeded
13 multifamily. So if you look inland, the inland
14 parts of the Southern California service
15 territory, that's still primarily single-family.
16 There are parts, like Irvine, obviously, Tustin
17 Ranch, where you have a lot of multifamily. But
18 the service structure as a whole, you do see us
19 reverting a little bit back to that long-term
20 average.

21 Echoing on Cyndee's comments, especially
22 with that average usage, so the megawatt hours
23 divided by customers or square footage, that does
24 produce a modeling challenge for us, and I'm sure
25 it does for your modelers, as well, too. Because

1 what we've seen the last few years, there's a
2 decoupling from economic indicators.
3 Traditionally, as an economy expands or it
4 contracts with GDP output or employment output
5 you see a good relationship with consumption of
6 energy. Now, because of that decoupling, because
7 of the efficiency gains, DR penetration, we're
8 seeing less of that, so that does create a little
9 bit more of a modeling challenge for us.

10 MS. MILLS: Good afternoon. Thank you
11 for asking me to be here. Karen Norene Mills for
12 the California Farm Bureau Federation. Just a
13 minute about the Farm Bureau, the state's largest
14 farm organization.

15 We work with our 53 county Farm Bureaus
16 that are throughout the state, representing 56
17 counties throughout the state, so we really are a
18 statewide organization. So agricultural regions
19 and areas might have particular concerns that
20 they face; there are a number of overarching
21 impacts and trends that face everyone, every farm
22 and ranch throughout the state.

23 Three key drivers for trends that we
24 expect to see in the future are, of course, water
25 availability and policy, labor availability and

1 regulations and, of course, land use constraints
2 and impacts from various policies. Overlaying
3 those kinds of concerns are the fact that the
4 demographics for farmers and ranchers throughout
5 the state, and really throughout the country, are
6 an aging ownership trend. And these are largely
7 family farms, and over 90 percent of the farms
8 and ranches in the state are family owned, family
9 based. So it has -- the age demographic has an
10 impact as we move forward throughout the years.

11 MR. MCRAE: Good afternoon. I'm Tim
12 McRae with the Silicon Valley Leadership Group.
13 And we do an annual assessment of the economy of
14 Silicon Valley for our Competitiveness and
15 Innovation Project, comparing Silicon Valley to
16 other innovation regions around the U.S., like
17 New York and Boston, Seattle and Austin, and
18 Southern California.

19 The most recent data we have shows that
20 2010 to 2015, jobs increased 29 percent in
21 Silicon Valley. The population increased eight
22 percent. Housing stock increased four percent.
23 So median home prices in Silicon Valley now top
24 \$1 million.

25 Silicon Valley average roundtrip commute

1 times are now 72 minutes. So traffic and housing
2 are the big issues that we work on. And we have
3 led several transportation measures, like trying
4 to fund BART to Silicon Valley, which will come,
5 lots of Caltrans improvements. We
6 (indiscernible) campaign for (indiscernible)
7 statewide housing ballot measures, and we expect
8 this to continue. There will be other things
9 that I talk about that are impacting us from an
10 energy and the economic competitiveness of
11 tariffs and immigration policies. But we're
12 growing and we expect to continue to grow.

13 MS. BEDSWORTH: Great. And then, Jeff
14 Bellisario, can you hear us?

15 MR. BELLISARIO: Yes. I'm on the line.
16 Can you hear me?

17 MS. BEDSWORTH: Yes. Great. Would you
18 like to weigh in sort of around, you know, the
19 trends in, from your perspective, in the Bay Area
20 Region?

21 MR. BELLISARIO: Yeah. I'm with the Bay
22 Area Council. We represent 325 business
23 (indiscernible).

24 I think a couple of things that I'll
25 mention.

1 One, as you mentioned before, housing
2 affordability is key for us kind of driving
3 slower population growth, driving longer
4 commutes, kind of increasing the cost of doing
5 business overall in the Bay Area.

6 And then two, we look a lot at the
7 Northern California megaregion. We're seeing
8 population growth in places like Tracy and
9 Stockton, and even Sacramento to a very high
10 degree, higher than in the nine-county Bay Area.
11 But yet the majority of Northern California's job
12 growth is still in places like San Jose, Silicon
13 Valley, San Francisco.

14 So there's a growing disconnect between
15 where the people are and where the population is
16 growing fastest versus where jobs are growing
17 fastest. So that's definitely a trend we'll be
18 watching going forward.

19 MS. BEDSWORTH: Great. Thank you all.

20 So next we'll move to talk about more on
21 the regulatory and policy environment, and I
22 think we'll sort of combine the set of topics so
23 that you can each talk about the piece that's
24 most relevant, but just to give some perspective
25 on how environmental regulations are playing out

1 in your region, thinking specifically around
2 renewables and energy efficiency, you know,
3 things that are working, things that are not, you
4 know, and just sort of give that perspective from
5 where you sit.

6 We can go down the line again or we -- go
7 ahead.

8 MR. CHO: Yeah.

9 MS. BEDSWORTH: We're going to start with
10 (indiscernible).

11 MR. CHO: At an NPO perspective, we're
12 kind of in charge of implementing SB 375 which
13 reduce emissions from light- and medium-duty
14 vehicles by integrating land use (phonetic) and
15 transportation. And part of the plan is to
16 encourage transit-oriented development and
17 focusing development in high-quality transit
18 areas. So through that, we can improve
19 congestion which will enhance a region's
20 competitiveness.

21 But the concern is that we see a
22 declining trend in ridership, even though we
23 introduce transit (indiscernible) development.
24 And we also see displacement of low-income
25 families, which is opposite of what we are trying

1 to do.

2 So we see congestion pricing way of to
3 reduce congestion and take people from driving to
4 using transit. And also innovative funding
5 strategy to build more affordable housing, such
6 as tax increment financing, would be helpful.

7 Thank you.

8 MS. EGOSCUE: Tracy Egoscue, Port of Long
9 Beach.

10 Most of you know that we have had a Clean
11 Air Action Plan in partnership with our
12 neighboring port since 2006. And it was
13 something that the ports put together and
14 committed to early on. And we've, I hate to say
15 this, but we've picked a lot of the low-hanging
16 fruit.

17 We have an international asset in the two
18 largest ports of America, which means that we
19 have international assets that visit us and we
20 don't control their emissions.

21 So although we've seen great reductions
22 in the sources of emissions that we've been able
23 to encourage voluntary compliance, we are having
24 a bit of a struggle with our greenhouse gas
25 emissions. It's definitely going to be something

1 that I am calling the final frontier. We're
2 going to have to re-envision what it means to use
3 fuel to move trade internationally.

4 Having said that, when we did our 2017
5 update to our Clean Air Action Plan, we modeled
6 it after the Sustainable Freight Action Plan and
7 we did that very closely, so that regulation
8 helped us. It allowed us to say this is our
9 barometer.

10 But I will say that we do need, and it
11 would be helpful to understand, some more
12 direction on that front. We can't regulate
13 trucks; because it's across state lines, that's a
14 national asset. We can't regulate ships. And
15 unfortunately, those are our two largest sources
16 of our greenhouse emissions.

17 On a final note, the international
18 community has adopted a low-sulfur fuel standard
19 which will come into place in 2020. That is all
20 the talk. We just came back from Shanghai and
21 all of the major shippers are talking about that,
22 the impact that will have. It will mean more
23 LNG, which we should notably talk about at some
24 point, whether or not we actually have the
25 fueling capability in our port complex.

1 Thank you.

2 MS. FANG: And focusing on GHG and
3 renewable policies, I see three areas that we
4 just want to make sure are being covered. So as
5 we continue to progress with more renewables, you
6 know, the biggest challenge is going to be how do
7 you deal with the imbalances between supply and
8 demand? So just to make sure that, you know,
9 this creates a huge opportunity for storage to
10 play a huge role in addressing and being able to
11 avoid curtailments. And so just making sure the
12 technology is really going to be there and ready
13 to address the magnitude of this need I think is
14 important. And to make sure that we also
15 continue to explore other options, whether or not
16 maybe hydrogen or other technologies might be
17 able to also help sort of address that particular
18 issue.

19 From the utilities' perspective,
20 especially when we look at the electric
21 utilities, you know, the biggest -- the gap is
22 that with all of these policies the
23 transformation of how we provide energy to our
24 customers, the rate design is still archaic and
25 still lags behind that. So the comments I made

1 earlier about what happens as our customer use
2 decreases, as our sales decline, and we continue
3 to pursue those energy efficiency goals, the
4 rates go up. And how do we start to manage that
5 and how do we start to move that along into
6 something that will be more sustainable as we
7 continue to move forward with energy efficiency
8 and as we expect to actually get to something
9 closer to net zero?

10 In addition, the discussion this morning,
11 the thing that I was struck by is the discussion
12 about the commutes, about customers who work one
13 place, live somewhere else, have this massive
14 commute. And how do we start to really continue
15 to move towards the governor's goals when we look
16 at EV adoption? And so the charging
17 infrastructure to really support that
18 electrification is going to be critical.

19 MR. MARTINEZ: Ed Martinez from Southern
20 California Edison. Again, similar to Cyndee's
21 comments, I'm obviously supporting the state's
22 initiatives on greenhouse gas reduction. I'm
23 also supporting customer choice, especially in
24 this age of CCA adoption. We're a little bit
25 behind PG&E. The next few years, obviously, will

1 be critical mass for us. We obviously want to
2 work at the state level with our CCA partners,
3 ensuring that's a success.

4 Going back to some of the comments from
5 this morning, some of the risks that we wouldn't
6 have imagined just a few years ago, especially
7 when it comes to tariffs on the solar panels, and
8 also with the EV adoption, one challenge for our
9 modelers is just seeing where exactly are we on
10 that adoption curve? Again, a few years ago we
11 might have had a little bit -- we would have
12 thought we were a little bit more further along
13 with that adoption. Now as we get -- as the data
14 comes in and these new risks emerge that weren't
15 available, that we weren't available a few years
16 ago, there's just some sort of adjustment to
17 that. But that's obviously a short-term
18 challenge for us.

19 MS. MILLS: So it's difficult to know
20 where to start when you talk about environmental
21 regulations with respect to agricultural. It's a
22 resource-based business. They see it in every
23 aspect of their business.

24 But maybe a place to start, of course, is
25 with respect to water availability. And one of

1 the bit issues, of course, that everyone
2 throughout the state is looking at is a state
3 Groundwater Management Act that will be on the
4 path to being implemented as the agencies are
5 being formed.

6 And one of the questions that I've
7 pondered as it was enacted and then is being
8 implemented is the interrelationship with energy
9 use. Because as you all know, on-farm production
10 agriculture, energy use is very closely tied to
11 water movement throughout the state.

12 And so some of the policies that we see
13 with respect to water use, and then with respect
14 to energy use, in some ways conflict with one
15 another with respect to time-of-use rates where
16 it's -- where the mandate is incentivizing
17 farmers to pump water and to use water at the end
18 of the day -- in the middle of the day rather
19 than at the end of the day as has existed because
20 the water evapotranspiration, right, has
21 increased when you use it during the middle of
22 the day. So there will be, you know, there will
23 be conflicts as it's implemented. And the
24 implementation of it may prefer one aspect over
25 another in terms of saving water usage as,

1 perhaps, as opposed to energy usage.

2 There are a lot of opportunities for
3 energy efficiency in the ag sector and a number
4 of plans are in place. And people improve their
5 processes on a continual basis, not necessarily
6 using energy efficiency funds that are available
7 and pass through the utilities and the Public
8 Utilities Commission because sometimes those
9 programs are so cumbersome and the checks and
10 balances that have to be dealt with make it
11 difficult for them to utilize them, and so they
12 just do it on their own and --

13 COMMISSIONER HOCHSCHILD: Could you --

14 MS. MILLS: -- then take advantage of
15 that.

16 COMMISSIONER HOCHSCHILD: -- could you
17 say a little bit more about that? I mean, just
18 looking at the opportunities for energy
19 efficiency within the agriculture sector, what is
20 the low hanging fruit, for lack of a better --

21 MS. MILLS: Well, unfortunately, the low
22 hanging fruit has been used and dealt with over
23 the years. And I think one of the problems with
24 the way those programs are implemented is that
25 once, you know, a few people have used them and

1 seen that it works, it's assumed that everybody
2 can do that and implement it on a cost-effective
3 basis, which is not necessarily true. Keep in
4 mind, farmers and ranchers, as I said, are
5 family-based businesses. They make a strong
6 practice of keeping their equipment and making
7 use of it for a long period of time in order to
8 be cost effective.

9 But there are real opportunities, and
10 technology is helping with that. As you are well
11 aware, a lot of nut producers in the state, and
12 that's been increased in all those, you know,
13 almonds, walnuts, pistachios, they all have to be
14 dried and hulled. And there's a lot of
15 opportunities in that area to reduce, for
16 example, drying times and processing times, and
17 that can be done with technology.

18 COMMISSIONER HOCHSCHILD: You know, one
19 thing, I'm sure you're aware of it, but we could
20 certainly use your help in getting the word out,
21 we're launching, this month, Renewable Energy in
22 Agriculture Program and grants in the quarter-
23 million-dollar range for farms around the state.
24 So we need all the help we can get in getting the
25 word out on that.

1 MS. MILLS: Right. And I've been in
2 contact with your staff people and have --

3 COMMISSIONER HOCHSCHILD: Good. Thank
4 you.

5 MS. MILLS: -- sent it along to our
6 internal publication to do that. And I would say
7 that in working with the Energy Commission, I
8 mean, you all have been very receptive to
9 concerns about making it as easy as possible for
10 the end producer to take advantage of it and
11 figure out how to navigate that process for
12 requesting grants and implementing those
13 programs.

14 COMMISSIONER HOCHSCHILD: Okay. Well --

15 MS. MILLS: So we appreciate that.

16 COMMISSIONER HOCHSCHILD: -- thanks for
17 your help with that.

18 CHAIR WEISENMILLER: You know, I was just
19 going to ask you, in terms of getting feedback on
20 our EPIC Program, that's obviously queued more to
21 food processing.

22 MS. MILLS: So, you're right. And so
23 Farm Bureau, obviously, you know, our focus is on
24 production agriculture and, you know, a little
25 bit aware of how the food processor sector works,

1 so that's, you know, canners and processors --

2 CHAIR WEISENMILLER: Right.

3 MS. MILLS: -- are a little bit more
4 focused. So they're much higher energy users, I
5 believe, than production agriculture is in
6 looking at efficiency efforts. And I know that
7 you've done a lot of interesting things with
8 respect to those types of programs. But I don't
9 have a lot of knowledge in that area --

10 CHAIR WEISENMILLER: Okay. That's good.

11 MS. MILLS: -- Chair.

12 CHAIR WEISENMILLER: I just, I think both
13 of us would happy to get feedback on how the
14 programs are going.

15 MS. MILLS: Right.

16 CHAIR WEISENMILLER: Yeah. Well,
17 actually, all of us would.

18 Tim, do you have something?

19 MR. MCRAE: Great. So Tim McRae with
20 Silicon Valley Leadership Group.

21 On renewables, we have sort of a diverse
22 membership. We both have folks who provide
23 renewable energy and those who are end users of
24 that renewable energy. And as such, it's a
25 little bit of a complicated policy for us.

1 The Leadership Group did support SB 100
2 in its final form. But it's worth noting that
3 our position was to support if amended until the
4 bill included language about safety,
5 affordability and reliability. And this body,
6 along with the other agencies, will have to
7 contribute to a report every four years that
8 evaluates of SB 100 on safety, affordability and
9 reliability, and so we'll plan to watch that
10 closely.

11 It's worth noting that environmental
12 regulations often create opportunities for
13 Silicon Valley businesses. I'll cite two
14 examples.

15 This Commission mandated, generally
16 speaking, solar rooftops on new construction
17 homes. And our solar members are looking forward
18 to taking advantage of the growing market that
19 that will create. And similarly, the Air
20 Resources Board recently mandated that transit
21 districts buy zero-emission buses. And not only
22 do we have bus manufacturers that stand ready to
23 meet that mandate, one of them actually moved its
24 headquarters to California in anticipation that
25 California would be the best market for its

1 product.

2 MS. BEDSWORTH: Great. Thank you all.

3 And then I will now -- oh, sorry, go to the
4 phones.

5 Jeff, would you like to jump in on the
6 question around regulation and how it's playing
7 out in your region and any specific points around
8 especially renewables policies and programs or
9 energy efficiency policies and programs?

10 MR. BELLISARIO: (WebEx echo.) Yeah. I
11 guess I'll echo what Tim said. I mean,
12 communities, I think as earlier mentioned,
13 there's a big opportunity around energy storage
14 and electric vehicle charging infrastructure. I
15 think you'll hear a lot about Google and
16 companies in the Bay Area are already moving
17 towards autonomous vehicles. Obviously, there's
18 some overlap with EVs there. But I think that
19 the nearer-term story and bigger story is more
20 electric vehicle adoption and then charging
21 infrastructure being built out in the region.

22 And maybe on a second note, I'll shift
23 again to the megaregion. You know, when we poll
24 our members here in the nine counties, you know,
25 renewable policy, energy regulations generally

1 fall pretty low on the list of their concerns.
2 But when we start going out into the Central
3 Valley in places where there's a bigger
4 manufacturing footprint, maybe more logistics,
5 maybe lower margin of businesses, those
6 businesses tend to be very, very concerned about
7 their energy costs. And we're continuing to kind
8 of hear stories of businesses moving to Nevada or
9 Oregon or Texas due to lower costs overall. And
10 I think part of that is kind of the energy costs
11 that go into that.

12 So as we're thinking about the Northern
13 California megaregion and kind of growing the job
14 footprint, we're attempting to move those
15 manufacturing and logistics jobs into places like
16 the Central Valley. But increasingly, other
17 states are more competitive than we are here in
18 California.

19 MS. BEDSWORTH: Then we'll move on, I
20 think, then to the next set of questions, really
21 sort of as we look ahead to the future. And I
22 think I would ask each of you, and you've touched
23 on this a bit, sort of what sort of trends are
24 you anticipating within your sector or your
25 region around new investments as you look forward

1 and you're looking ahead?

2 MR. CHO: As an NPO, we do read housing
3 development and transportation plans. And in
4 L.A., we have a huge homeless population. And we
5 are expecting to see more affordable housing for
6 homeless population in L.A. And also, as online
7 shopping grows we're expecting to see more real
8 estate industry development in Inland Empire,
9 which is a big driver of job creation in SCAG's
10 region.

11 MS. EGOSCUE: This is Tracy Egoscue with
12 the Port of Long Beach.

13 We are, actually, right now a hotbed of
14 investment and technology. A lot of the zero-
15 emission equipment doesn't exist currently and so
16 we have a lot of investment, a lot of incentive
17 programs to try and encourage the development. I
18 would note that in terms of rebate programs,
19 Edison, I'm talking to you, some of our highly
20 specialized equipment doesn't entirely fit within
21 the mold. So I would also encourage maybe an
22 evaluation or examination, or maybe even an
23 analysis of how to encourage rebates and
24 incentivized action by our customers.

25 We have a bit of a yin and yang at the

1 port right now where we really want to advance
2 our goals for clean air. As you all know, we're
3 in a region of nonattainment. We have the highest
4 asthma rates in Long Beach in the entire county.
5 We are a responsible port. We want to make sure
6 that we listen to our community and take care of
7 our community, which we understand means lowering
8 emissions. But right now, quite frankly, most of
9 the technology doesn't quite exist. So calling
10 all inventors, entrepreneurs, wherever you are,
11 we are -- we have an open-door policy. I take
12 meetings all the time. And I very much encourage
13 the future in that regard.

14 Thank you.

15 COMMISSIONER SCOTT: This is Commissioner
16 Scott. I just want to jump in.

17 The Port of Long Beach is one of five
18 ports that have been working very closely with
19 the Energy Commission in a collaborative over the
20 last four years or so to look at some of the
21 equipment and also some of the charging
22 solutions. And so I would love to talk with you
23 and Edison a little more offline to see if we can
24 think about what projects in that space we might
25 be able to work on to at least nudge some of this

1 stuff forward a little bit. But we're always
2 looking for great opportunities like that.

3 MS. EGOSCUE: I very much appreciate
4 that, Commissioner. And I'm sure that we would
5 come up to see you, Edison and the Port, with our
6 staff; right? I'm not volunteering their
7 resources. But we are -- we want to all work
8 together and be sustainable together and
9 successful together, so I appreciate that.

10 COMMISSIONER SCOTT: We're usually
11 working with Heather Tomley on your team, so
12 let's make sure we bring her in, as well.

13 MS. EGOSCUE: She's amazing.

14 COMMISSIONER SCOTT: She's great.

15 MS. EGOSCUE: Thank you.

16 COMMISSIONER MCALLISTER: I wanted to ask
17 a question.

18 So you know, we've heard a number of
19 folks, Farm Bureau and Long Beach and industrial
20 sector a little while ago, I guess, about how
21 difficult it is to participate in the portfolio
22 programs or get, you know, rebates or, you know,
23 get incentives to be able to change out
24 equipment.

25 I was wondering if, you know,

1 representatives from SDG&E and Edison could sort
2 of comment on the -- why those constraints exist,
3 so of what the -- you know, help us unpack that
4 problem? I know it's a fairly, you know,
5 complicated problem. But if you could sort of
6 help us -- help everyone understand sort of
7 what -- why those constraints exist and sort of
8 what some of the barriers are and maybe propose
9 some solutions to helping get beyond them?

10 MR. MARTINEZ: I'm not the best person to
11 answer that. But I will follow up with Catherine
12 Hackney and our team up here, and also back down
13 in Rosemead. I'll follow up on that.

14 CHAIR WEISENMILLER: Actually, I was
15 looking for Heather, who just stepped around the
16 corner, I assume.

17 But anyway, written comments will be due,
18 so that might be something you could build into
19 those.

20 MR. MARTINEZ: Yeah.

21 CHAIR WEISENMILLER: And she will remind
22 us when they're due later.

23 UNIDENTIFIED FEMALE: Okay. Written
24 comments are due on Thursday, January 31st.

25 CHAIR WEISENMILLER: Thank you.

1 MS. BEDSWORTH: Cyndee, did you want to
2 pick up on sort of trends you're seeing for
3 investments or, you know, areas of growth in
4 your -- or SDG&E?

5 MS. FANG: So for SDG&E, we're always
6 striving to be the cleanest, safest, most
7 reliable utility, and so our investments sort of
8 follow along those lines. And some of those,
9 I've spoken to already as far as like how do we
10 also strive to get to that cleanest aspiration
11 while still being reliable and safe? So you
12 know, electrification, infrastructure,
13 renewables, energy storage, all of those are
14 going to be top of mind.

15 MR. MARTINEZ: For Southern California
16 Edison, ensuring reliability at the grid going
17 into the future, especially with projects like
18 the Clean Power and Electrification Pathway. And
19 even in the IEPR process, this will be my third
20 IEPR process, 2019, we've seen a focus from a
21 macro systemwide down to the circuit level. And
22 a lot of that circuit level focus is to ensure
23 adoption of DRs on PV, EV, and even with energy
24 storage. So that's obviously a big focus for us
25 and will remain a focus for us going on into the

1 future.

2 MS. MILLS: So I studied for this panel
3 by going through our news publication that comes
4 out each week, Ag Alert. And what might take
5 away from reviewing it is a lot of the
6 investments are driven by regulations.

7 One of the big investments that will be
8 taking place in the San Joaquin Air District is
9 new tractors because they're mandated because of
10 the air quality constraints that, you know,
11 12,000 tractors have to be replaced by 2024. Now
12 tractors and on-farm, in-the-field tractors
13 probably aren't the ones that are viable for
14 electrification. Some of the smaller, light-duty
15 vehicles are and they've got programs, some
16 experimental programs or pilot programs to do
17 that. And those, apparently, are fully
18 subscribed, so we're seeing investments in those
19 areas.

20 As I mentioned before, automation, one of
21 the constraints for automation and for
22 technologies and communication is broadband
23 throughout rural areas. And so it's served in
24 some areas. There's even parts of the valley
25 that have it available. It's not reliable and

1 consistent enough to depend upon or it's
2 oversubscribed. So it's an impediment throughout
3 the state to new investments and advancements and
4 things.

5 But you know, even with mandates and
6 looking for, you know, farmers are amazingly
7 creative and resilient and focus on new ideas.
8 And for example, one of the new things that was
9 addressed in one of the articles was someone was
10 using drip tape for seed germination in row
11 crops. So I think that people are constantly
12 looking through -- looking for ways that improve
13 their inputs and efficiency of their inputs, and
14 that, of course, has an impact on energy. And I
15 think they'll continue to change in the future.

16 MR. MCRAE: So I'll highlight two areas
17 of federal government-driven uncertainty for
18 Silicon Valley, tariffs and immigration.

19 We disagree with the president's approach
20 on trade, and that's putting it mildly, which
21 creates significant uncertainty for Silicon
22 Valley businesses. For example, Apple has stated
23 revised revenue projections and its recent
24 decline in market value is directly attributable
25 to the U.S.-China trade war and its intended

1 tariffs. Early this year the Dow Jones
2 Industrial Average dropped 2.8 percent, largely
3 caused by that news. Other companies have also
4 stated that the administration's trade policy is
5 forcing them to consider the unpalatable option
6 passing along the higher prices to consumers or
7 absorbing the higher import costs by eating into
8 their profit margins.

9 In the energy sphere, the tariffs
10 announced last year on foreign-made solar panel
11 manufacturing negatively impacted the solar
12 sector both in terms of our solar companies, many
13 of whom make their solar modules in other
14 countries, and for end users who have to pay more
15 for more of the solar panels that they.

16 And an immigration policy; immigration
17 policy uncertainty definitely impacts Silicon
18 Valley businesses who are eager to hire skilled
19 workers. We're growing. We need lots of skilled
20 workers. They come from all over. They come,
21 some from the United States, but we also need
22 them from outside the United States. We don't
23 know if there will be the usual quota of H-1B
24 skilled worker visas this year. And there's also
25 uncertainty with regard to H-4 visas. And H-4

1 visas are for spouses and families of H-1 visa
2 workers, which are also at risk. H-4 visas can
3 be as important as H-1 visas for convincing top
4 talent to come to Silicon Valley as two incomes
5 are almost a necessity for owning a home in our
6 high housing cost region.

7 MS. BEDSWORTH: All right. And, Jeff, do
8 you want to weigh in on, you know, trends that
9 you're anticipating around new investment or
10 growing areas of investment?

11 MR. BELLISARIO: (WebEx echo.) Yeah. I
12 think we're -- this is more of a hopeful area for
13 us in the Bay Area. I think we're hopeful for
14 discussions around housing design and alternative
15 housing designs and building methods.

16 A couple things that the Bay Area Council
17 has supported around mixed (indiscernible). They
18 also tend to be smaller and more affordable.
19 (Indiscernible) in San Francisco and
20 (indiscernible) more units (indiscernible)
21 multifamily dwelling.

22 Another thing that was mentioned in the
23 previous panel, modular construction, I think
24 that's a huge opportunity just to lower the
25 building costs. It would help the entire state

1 help fill that gap.

2 MS. BEDSWORTH: Thanks. And I know some
3 of this just came up in the last -- in the
4 answers to the last question but I'll just throw
5 it out again, if folks have other or significant
6 uncertainties that they see that could affect
7 either the work that you're doing in your region
8 or your region overall, if there are other items
9 that haven't been touched on?

10 MS. EGOSCUE: I feel like I need to weigh
11 in on the tariffs just because something has not
12 been widely reported. But the Port of Long Beach
13 broke our cargo record for last year because of
14 the tariffs. There was a rush to avoid them.
15 And our warehouses are full in the Inland Empire,
16 as well. So we might see a slowdown in the new
17 year, especially with the lunar new year. And we
18 might see a bit of a correction. But I just
19 wanted to let you all know that we broke over 8
20 million TEUs for the first time in the port's
21 history in direct response to the tariffs. A bit
22 of a twist of fate, of sorts.

23 MR. MARTINEZ: Southern California
24 Edison.

25 I'd echo some of the comments, certainly,

1 about housing, especially the lack of affordable
2 supply in this state. That's obviously going to
3 impact a lot of the goals that we have,
4 especially for -- on the solar panels.

5 I did reach out to the California
6 Association of Realtors yesterday, Oscar Wei.
7 And he confirmed for me that what we're seeing in
8 the Southern California region, at least, is
9 continuing price increases, declining sales
10 because of the lack of supply, and also that
11 combination of interest rates.

12 I think the demographic panel did a
13 really good job on talking about that more or
14 less consistent outflow of a domestic net
15 migration out of the state. So as the folks,
16 especially millennials, hit their prime earning
17 years, start earning families -- creating
18 families, if they can't afford to buy a house and
19 that housing market isn't responding to that
20 demand, then that demand is going to filled in
21 Arizona, Nevada, Texas, other states. That
22 obviously will have an impact on our planning
23 efforts from our end.

24 MS. MILLS: Well, so farming and ranching
25 is, by its very nature, uncertain. Much as we

1 crave predictability and certainty, it doesn't
2 happen a lot because so much is driven by the
3 weather.

4 But you know, that being said, some of
5 the uncertainties that much of the state's
6 agriculture is facing, one, of course, is with
7 respect to water supplies. As I mentioned, that
8 Groundwater Management Act, but also the higher
9 flows requirement for the San Joaquin River has
10 got people spinning a bit about what to expect in
11 the near future.

12 I'd agree about the tariff situation.
13 That has an impact, current impact, especially on
14 high-value crops and on the prices of some of
15 those crops. And there's a concern over losing
16 market share. So it's not just an immediate
17 impact, it's a future impact and, you know, how
18 quickly the markets will come back after, you
19 know, assuming that there -- this is especially
20 true with China which is a big market, especially
21 for a lot of the nut crops.

22 You know, there's other impacts, aside
23 from the tariffs, as well, some of the food
24 safety laws that the other countries are changing
25 and putting in place. So the markets here have

1 to adjust to that and predict, so there's always
2 something changing and folks are having to adjust
3 to. That's a constant process.

4 MS. BEDSWORTH: Any other uncertainties?

5 Jeff, I want to make sure, if you have an
6 option -- opportunity.

7 MR. BELLISARIO: (WebEx echo.) I think
8 right in the dimension of (indiscernible) energy
9 consumption is related (indiscernible).
10 Immigration, as I mentioned. The aging
11 workforce, as I mentioned. It will be
12 interesting to see if we can hit some of the kind
13 of demographic projections given some of those
14 headwinds, especially headwinds around
15 affordability. We're definitely seeing more
16 people moving out of the state than coming in.
17 Our growth in the Bay Area is basically on
18 international immigration. That kind of drives
19 us. We could be talking about a different future
20 in terms of growth trajectory for the Bay Area
21 and for the entire state.

22 COMMISSIONER SCOTT: Louise, can I -- I'd
23 love to jump in and ask a question. It goes back
24 to the housing theme.

25 And, Bob Raymer, I might give you a

1 little heads-up. You brought the chart for us
2 and mentioned it in the comments at the beginning
3 that were at about 120,000 units built this year,
4 and that you thought that that might be less for
5 next year. But I don't think you had a chance to
6 mention that. And just when I listened to Jeff's
7 comments and Eduardo's comments and Tim's
8 comments and others about housing, I'd love to,
9 if you wouldn't mind giving us a few more details
10 on that from earlier?

11 MR. RAYMER: Thank you for raising that.
12 Bob Raymer with CBIA again.

13 And, indeed, hopefully those who are
14 leaving will have a chance, I've left 50 or so
15 copies of this chart out on the front desk as you
16 get in. But as the Commissioner just mentioned,
17 in 2018, we now have a pretty good firm
18 understanding of what -- we always true these
19 numbers up after the fact to make sure that the
20 permits that got pulled got built and whatnot.
21 We'll be just under 120,000 for this year. And
22 you see the breakdown from the chart, that we're
23 still a tiny bit higher up on multifamily versus
24 single-family. So sort of the new normal is it's
25 not one-third/two-thirds, it's basically kind of

1 half and half now.

2 Having said that, what has happened in
3 certain areas of the Bay Area, in Los Angeles and
4 in San Diego, you've got pricing pressure that
5 we've been hearing about all day, sort of,
6 intermixed with the labor shortage. And without
7 those finished lots to move onto, even slowly,
8 we're seeing some major urban areas where -- and
9 when I say urban area, I mean, you know, the
10 buildout area, where the permits have dropped 50
11 percent, and that's stunning. That's not because
12 of bad weather or whatever else. These were
13 things that began happening back in August and
14 September and during the fourth quarter really
15 kind of blossomed.

16 And I can tell you right now, this --
17 well, not this time next year, but in October,
18 November and December of 2019, you're going to
19 see a whole bunch of permits getting pulled
20 because state law says you comply with the
21 building codes that are in effect. And there are
22 always those that, well, I'd rather put that off.
23 Well, you're going to see that again. But right
24 now, I would guesstimate that we'll probably be in
25 100,000 to 105,000. And we should be, you know,

1 to get out of here, we should be moving up.
2 We've plateaued at 65 percent of normal. That's
3 the new normal.

4 And the problem here is that we're
5 supposed to be building anywhere -- at a minimum
6 of 180,000 units a year. We would suggest about
7 200 to 210. But at 180, the number of 8CD and
8 LAOUs, that means we've got 1.2 million unit
9 deficit just from this chunk that we didn't build
10 here and add to that the 2 million unit deficit
11 that we had going into this, that's why housing
12 prices continue to skyrocket. And so we've got a
13 problem here.

14 So thank you.

15 COMMISSIONER SCOTT: Thank you for
16 providing that additional information. And just
17 for folks in the room, they are out on the -- the
18 chart is out on the table. And for folks who are
19 listening on the WebEx, I imagine our delightful
20 IEPR team will have that posted for you to be
21 able to see.

22 MS. BEDSWORTH: Well, I think I'll put
23 one more question out that shifts, maybe shifts
24 us a little bit. We've heard a lot about work
25 that's happening around renewables and

1 efficiency. And another question we wanted to
2 ask you all to think about was how your region
3 and your sector of work is thinking about
4 adapting to the impacts of climate change and
5 what the challenges there will be?

6 MR. CHO: Yeah. In transportation system
7 and infrastructure prospective, we're going to
8 need to develop a resilient transportation system
9 that can minimize the damage, and also minimize
10 PG&E's disruptions in case of earthquake, fire or
11 any kind of natural disasters.

12 And SCAG, as an NPO, is conducting
13 research with our university. And also to
14 educate our local jurisdictions, we have worked
15 with Lewis Jones, Dr. Lewis Jones, to educate our
16 planners and current jurisdictions. And then
17 that's, I think, a part of planning for climate
18 change.

19 Thanks.

20 MS. EGOSCUE: Thank you. Tracy Egoscue
21 from the Port of Long Beach. I actually have a
22 few points that I'm going to go very quickly, in
23 the interest of time.

24 Obviously, I've already talked about the
25 electrification. Just a little bit of a footnote

1 there, we have to be mindful of what it means for
2 our workers at the ports. That's definitely a
3 byproduct of the climate change goals that we're
4 seeing.

5 I've also had a lot of conversations with
6 environmental leaders in the region who like the
7 zero-emission goals, but they'd also like to see
8 us have some kind of interim goal, as well.
9 They're afraid that we'll spend so much time
10 trying to get to this big goal far out that we're
11 going to not do much in the interim. And they
12 are really pushing us, and most of their very
13 respected leaders are behind that.

14 Also, we've done a Climate Resiliency
15 Plan for the port itself, the infrastructure. I
16 can tell you that we're looking at needing to
17 raise the breakwater. We're seeing much more
18 intensive events. We've had some damage as a
19 result of some of the storms. And we need to
20 make sure that, obviously, these ships are safe
21 coming into the facility.

22 And then last but not least but really
23 important, we're looking at water reuse within
24 the facility. We're actually encouraging. And
25 we're doing a study right now about moving

1 forward with recycling all of our water, not just
2 our potable water use but also our stormwater
3 within our facility because we are becoming more
4 and more concerned with water supply in the
5 future, and not only in the city, but in the
6 region.

7 Thank you.

8 MS. FANG: I think the one concern, well,
9 not one concern, but the biggest concern when we
10 look at trying to get at the carbon-neutral goal
11 is the cost of electricity. So we hear from our
12 customers all the time. And as we continue to
13 pursue these mandates which are great things to
14 be supporting, the challenge does get to be, and
15 we've heard from several today, about how do we
16 get to these aspirational goals while still
17 addressing issues like affordability and so on?

18 MR. MARTINEZ: For Southern California
19 Edison, there's a lot of management interest in
20 planning for climate change. From a forecasting
21 perspective, that's been a big focus of ours in
22 the last few years, which it had been when I
23 joined the company five years ago. But we are
24 starting to flush that out as do our long-term
25 forecast. But also, needless to say, obviously,

1 from a safety perspective, as well, too, it's
2 just the changing conditions of the state, all
3 the utilities face. So that's obviously a big
4 focus of ours, as well, too.

5 MS. MILLS: Just a couple of points to
6 follow up on what Cyndee said. Yes, our members
7 do -- are concerned with the price of
8 electricity. And many of them have sought out
9 the ability to have their own solar or other
10 types of renewable generation onsite and look at
11 storage. And so that's an opportunity, in order
12 to minimize the cost of electricity, that in the
13 broader context with respect to the -- to
14 agriculture as a whole adapting to changes in
15 climate or changes in weather trends, too, that's
16 been a constant process over many years that
17 agriculture has had sight of. And that's
18 manifested a lot of times in part by crop choice
19 or varieties of the particular crop that you're
20 growing.

21 And so they're mindful, farmers and
22 ranchers are mindful of what they're planting,
23 whether it's peaches or orchards or walnuts or
24 almonds or something else, in selecting in
25 varieties that either mature at a time that

1 they're not bumping up against compromising
2 weather, like rain in the fall, or that they're
3 not blooming too early and so aren't subject to
4 frost.

5 So I think as trends change, that's part
6 of the research that's being conducted at the
7 various agricultural colleges and research
8 stations. They look at that and adjust as they
9 predict the trends.

10 One interesting fact and anecdote is one
11 of our members, I know, commented, it was a
12 number of years ago, the same date, in one year
13 there was a frost event on one of their orchards
14 that had a big frost impact and negative
15 consequence to the production of the orchard,
16 three years later there was a heatwave and had a
17 similar impact. And I don't know which came
18 first, the frost or the heatwave, but you can see
19 that it varies so much from year to year, and so
20 it's difficult to predict.

21 But larger trends, they do try to select
22 varieties that meet with their own operations and
23 adapt to the changes that they're seeing.

24 MR. MCRAE: So I'll talk about two
25 aspects of our changing climate and what we're

1 trying to do to adapt, rising waters and fires.

2 In the Silicon Valley, we have rising
3 waters, both the San Francisco Bay, we have
4 creeks rising, we have the water table rising,
5 and that's all relevant to things. I'll give a
6 couple examples.

7 One, we have this great map in which you
8 can show all the different Silicon Valley
9 businesses which are dotted right on the bay of
10 Silicon -- of San Francisco Bay. And I was at a
11 meeting yesterday in which it was noted that if
12 we were having this meeting in 2050, we would all
13 have to be wearing hip waders because it's just
14 going to keep going up.

15 And other anecdotal evidence. All of the
16 airports, all three airports in the Bay Area,
17 Oakland, San Francisco, San Jose, are all built
18 on under -- on land that is under the sea level,
19 so that's obviously a huge economic issue for us.

20 We co-led measure AA in 2016 to try to
21 address rising waters. That was a \$12.00 parcel
22 tax on homes in the nine-county Bay Area. It
23 raised the local share for building wetlands in
24 San Francisco Bay. There's a great -- a report,
25 I believe it's a Bay Area Council Report, which

1 shows how much wetlands that we have to build in
2 the San Francisco Bay to be able to be a sponge
3 to absorb that rising water, and a lot of green
4 infrastructure is going to be needed. We're
5 trying to raise the local share for that. We're
6 looking at both the state and the federal level
7 to match that. And that's a huge effort.

8 And just, even though we've raised the
9 money from the local side, there's just a lot of
10 permitting issues. There are literally 14
11 different agencies involved in permitting all of
12 those wetlands, so that is something that we're
13 working very hard to try to make happen.

14 On the fire side, we supported SB 901
15 which was the omnibus fire legislation that
16 Senator Dodd carried at the end of last session.
17 And I will simply say that it's going to be a big
18 conversation going forward. How are we going to
19 address fire? How are we going to adapt to fire?
20 How are we going to adapt to -- I mean, and a
21 piece of that is the utilities' reliability issue
22 and that will probably take up a lot of air
23 space. But how are we going to prepare ourselves
24 best for fires going forward?

25 And I don't think that SB 901 is the

1 final conversation, the final -- the end to that
2 conversation. And we hope that there's going to
3 be a tech aspect to that, but hopefully there can
4 be Silicon Valley businesses that can help
5 provide the technological solutions to solve
6 those problems. But there's just a whole host of
7 things that we're going to have to look at to be
8 able to adapt to fires as our climate continues
9 to change here in California.

10 MS. BEDSWORTH: Jeff, would you like to
11 weigh in on preparing for changing climate?

12 MR. BELLISARIO: Yeah. I think Tim
13 actually said it perfectly, so I won't say too
14 much.

15 I think a lot of the work that we're
16 doing, especially in Santa Rosa, on how to
17 rebuild post-fire, so thinking about not just
18 where to build but how to build and attempting to
19 build more density and fire safety around our
20 residential and commercial structures especially
21 will be important, not just here in the Bay Area
22 and Northern California but across the state.

23 MS. BEDSWORTH: Great. Thanks.

24 So now I want to leave time for you all
25 to ask additional questions.

1 CHAIR WEISENMILLER: Yeah. I'm just
2 going to start out.

3 Putting on your non-moderator hat but
4 your Strategy Growth Council hat, do you want to
5 answer the last question?

6 MS. BEDSWORTH: About preparing for --

7 MS. SPENCER: Yeah.

8 MS. BEDSWORTH: -- changing climate?

9 Well, I tend to think of it, you know, basically,
10 in a pretty integrated way. So I see a lot of
11 the work that we're doing around reducing
12 emissions as being a real part of that, but also
13 how we build our communities to be more
14 resilient. And that's the infrastructure but
15 also how we support people and economies to make
16 them as resilient as possible. And so that comes
17 in with addressing and thinking about equity
18 considerations, thinking about a lot of the
19 issues that were touched on here, to me, strike
20 me as a lot around resilience issues, so having a
21 workforce that is capable, you know, is trained
22 and capable and available.

23 You know, so I see it as, really, as a
24 holistic issue that really ties together a lot of
25 the topics that were raised here, housing and

1 transportation and workforce and water. And so I
2 think -- so that's how I think about an approach
3 on how we start preparing for climate impacts.
4 And I think it's really important that we're
5 thinking about how our investments are supporting
6 people and economies, as well, because ultimately
7 that's such a key part of our long-term
8 resilience.

9 CHAIR WEISENMILLER: So I was going to
10 say, obviously, you and I were both at the
11 National Academy event. And the thing we learned
12 in terms of -- one day was California and one day
13 was other states. But certainly states which we
14 would think are fairly conservative and don't
15 acknowledge climate change that, you know, have
16 major agricultural production, people know
17 something's changing. And you know, that a lot
18 of those and, you know, some studies being done
19 by -- at their universities were implying really
20 massive changes in the crops they can grow, just
21 from what's happening now.

22 MS. BEDSWORTH: Yeah.

23 CHAIR WEISENMILLER: Again, I don't know
24 if you want to supplemental what I've said on
25 that but --

1 MS. BEDSWORTH: No, I think -- yeah, we
2 heard, if I recall, we heard from Montana and
3 Kansas. I think both --

4 CHAIR WEISENMILLER: Yeah.

5 MS. BEDSWORTH: -- participated in that.

6 And also what struck me about those is
7 how important that bottom-up information is. And
8 so this was an event at the National Academy
9 where we were talking about large-scale climate
10 assessments, which tend to be often very research
11 driven. And then some of these other states,
12 you're really seeing that information coming up
13 from folks on the ground, informing how they're
14 approaching an assessment.

15 So I thought that was, also, an
16 interesting piece of how you really need to marry
17 the experiential, you know, what's happening on
18 the ground with information that we're getting
19 through models and measurement and monitoring.

20 CHAIR WEISENMILLER: Yeah. I think the
21 other question, although again, this may be more
22 for Heather in the follow up, you -- basically,
23 Tracy had mentioned the change on environmental
24 requirements on tankers and basically moving away
25 from bunker fuel. And certainly, one of the

1 questions that means is it can have pretty
2 significant impacts on, well, the petroleum
3 market, particularly in terms of the mix of, you
4 know, stuff coming in of the certain mix, and
5 then you need parts coming out. And as you
6 change dramatically, you know, what's happening
7 to the bunker crude?

8 Then that has implications back on your
9 refinery mix and the products. And certainly,
10 there have been some studies done
11 (indiscernible), anyway, there have been people
12 who have said there's going to be phenomenal
13 price spikes in our oil market as that goes into
14 effect, in part, depending upon how the tankers
15 respond.

16 So it will probably be good for us to,
17 you know, follow up with WSPA just on what do
18 they see the implications in California of that
19 new requirement on tankers? Unfortunately, she's
20 gone, but I was going to ask Heather to do the
21 follow-up on that with her, you know, in terms of
22 the written comments.

23 And I guess, actually, both Edison and
24 San Diego raised questions about rate design. I
25 was going to ask generally, what would be your

1 ideal rate design, realizing that some of the
2 other participants at the table may shudder at
3 this idea, or may want to respond?

4 MS. FANG: Well, I think when we look at
5 some of the things that we identified as sort of
6 the main trends that we see, I mean, the
7 transformations that are happening in the
8 electric industry, it's crazy. It's moving
9 super-fast. And I don't know that the existing
10 rate structure, I mean, we've still got shared
11 (phonetic) rates in place where our residential
12 customers is really right when we talk about sort
13 of the evolution, you know, the very quick and
14 broad expansion of CCAs and all of these
15 renewable objectives. And how do we continue to
16 pursue energy efficiency goals and avoid these
17 sort of, you know, rate shocks?

18 And in particular for San Diego, this
19 past summer, we had a crazy hot summer. It was
20 like the hottest August that we've ever seen. We
21 had ocean temperatures that were, I think, in the
22 80s, which was crazy. So we actually had
23 humidity, which we never have humidity in San
24 Diego. And so what happened there is that we saw
25 just huge issues with our customers based on the

1 existing rate. So you know, obviously, customers
2 were increasing their -- you know, turning on
3 their ALISO CANYON.

4 And the unique thing about what happened
5 this past summer is usually we have a couple of
6 hot days and then it goes back to the typical San
7 Diego weather. But this was a persistence of hot
8 weather upon hot weather and so we had customers
9 turning on their AC. And everybody understands
10 that when they increase their usage their bill is
11 going to go up. But if -- what we had were
12 customers who would double their usage but their
13 bills went up way more than that because of the
14 exaggerated impacts that the shared rate
15 structure set in.

16 And so we also have the issue of
17 declining sales. I believe, and correct me if I'm
18 wrong, it's happening far more rapidly in San
19 Diego than it is at Edison and PG&E. So the CCA
20 issue is separate from that, but when we look at
21 the sales decline, solar penetration is happening
22 much faster. Our average residential usage is
23 like among the lowest across the country when we
24 look at other IOUs. And so what that does is it
25 does inflate our rates and so you end up with

1 situations where bill volatility becomes a huge
2 problem. And if CCAs are going to become a
3 prominent feature of San Diego's service
4 territory, the question starts to become, is this
5 all an energy rate really the best thing if it
6 creates bill volatility for our customers, you
7 know?

8 And the volatility ends up being a big
9 problem because customers can't predict,
10 businesses can't predict. And so trying to
11 consider something different I think is going to
12 be really important to sort of help manage this
13 future path.

14 MR. MARTINEZ: I would echo a lot of
15 those comments from Southern California Edison.
16 But I think that balance between grid
17 reliability, resource adequacy, and customer
18 choice, and also with the challenge that we just
19 faced this past summer where we hit an all-time
20 system peak on July 6th. And if that is going to
21 be the future for us, that's a lot of balls for
22 us to have up in the air and juggling. So I
23 think that's, like San Diego, like PG&E, that's
24 going to be a challenge.

25 CHAIR WEISENMILLER: Yeah. I was going

1 to say, the answer is that we'll be -- I think
2 again, if you look at the fourth climate change
3 assessment, the Scripps temperature
4 distributions, we're not just talking of
5 temperature rising, but we're talking a very
6 volatile, you know, very persistent spikes. And
7 you know, that has -- you know, certainly you've
8 seen much more air conditioning in the coastal
9 areas than people ever thought necessary.

10 And at the same time, that sort of
11 persistent heatwaves and, to some extent, more
12 persistence in the drought side means again, in
13 terms of fires, a lot worse fires coming. I
14 mean, that's certainly in the projections, the
15 wildfires.

16 So again, it's not a pretty picture going
17 forward. But we certainly have to figure out
18 ways of adapting to that and having more
19 resilient communities, just to deal with the
20 realities. Obviously, reduce greenhouse gas is
21 the less of an issue. But even from where we are
22 now and what's, you know, in some respects, quote
23 unquote, inevitable in the next few years as we
24 try to bend the curve, it's -- you know, as I
25 said, you're going to see a lot of spikes, so

1 yeah, in heat and wildfires.

2 COMMISSIONER MCALLISTER: So as a comment
3 and a question, and we're going to run out of
4 time here and I want to have a few minutes for
5 Bob to speak, and also for public comment, but I
6 guess we've talked a little bit about equity,
7 probably not enough. But one of the tasks that
8 this Commission has is to figure out ways to
9 improve the performance of our existing
10 buildings. That's part of our energy efficiency
11 policy for the most part.

12 But it strikes me that many of the
13 problems that you're talking through in this
14 integrated way, that Louise was referring to and
15 your own -- you know, each of your comments in
16 their own way has understood that there are
17 integrated -- there are multi-benefits, multiple
18 benefits to some of the -- actually, the best
19 policies are the ones that have multiple
20 benefits; correct?

21 So improving the performance in our
22 existing buildings, and we're talking about
23 people who own and rent, you know, not the
24 homeless population, but it has all sorts of
25 benefits. Like this volatility, if you actually

1 -- if your need for capacity for AC in your
2 building goes down because you have better
3 insulation, well, your volatility goes way down;
4 you stay in Tier 1 and Tier 2, and you don't go
5 up into Tier 3.

6 So I guess I'm hoping that some of you,
7 maybe with South Coast -- I'm sorry, SCAG can
8 maybe have some experience. I know that South
9 Coast AQMD has some experience with this, maybe
10 some others for your particular regions. Are
11 there sort of templates, model programs that, not
12 necessarily in the efficiency or even energy
13 space, but that have impacted the housing stock,
14 the existing housing stock in a positive way that
15 could serve as models for pumping some resources
16 into that to improve that piece of our
17 infrastructure, which is, you know, a quarter to
18 a third of our climate problem? SDG&E or Edison,
19 do you have existing building programs that have
20 had a big impact?

21 MS. FANG: The one I'm aware of is our
22 ESAP program, so the Energy Savings Assistance
23 Program. So what that does is it helps support
24 energy efficiency investments, specifically for
25 our low-income customers. I don't have specific

1 details about it but we can follow up with more
2 information.

3 COMMISSIONER MCALLISTER: Great. That
4 would be great. And I'll note that there's a
5 couple hundred million dollars that's underspent
6 statewide in that program, so what can we use
7 that money for?

8 MR. MARTINEZ: Certainly, I'll follow up,
9 as well, too. I'm actually a Pasadena Water and
10 Power Customer. I know they actually do have
11 water programs, especially for their older homes,
12 too, and their historic areas, which is where I'm
13 present. I'll follow up on that, if you'd like?

14 COMMISSIONER MCALLISTER: In terms of the
15 NPO, is there any of this on your radar at all?

16 MR. CHO: We are in charge of RHNA,
17 Regional Housing Needs Assessment --

18 COMMISSIONER MCALLISTER: Um-hmm.

19 MR. CHO: -- so we focused on production
20 of household increase in the future, and then
21 consulted with HUD (phonetic). But we have not
22 embarked in energy efficiency and related to
23 housing stock.

24 COMMISSIONER MCALLISTER: Well, maybe
25 there's a way to relate those two and sort of

1 talk about quality of housing and, you know,
2 quantity of housing, see if they'll intercept.
3 So maybe there's a theme we can follow here.

4 MR. CHO: Yes. Yes. One of the changes
5 we received just around RHNA is overcrowding. So
6 it's related to the household health issues, and
7 so I think we can touch on that.

8 MS. BEDSWORTH: There are some
9 interesting pilot programs in Southern California
10 that you probably are aware of that have looked
11 at insulation and networked thermostats in low-
12 income communities.

13 COMMISSIONER MCALLISTER: That's the
14 South Coast --

15 MS. BEDSWORTH: Yes.

16 COMMISSIONER MCALLISTER: -- funded
17 stuff?

18 MS. BEDSWORTH: Yeah.

19 COMMISSIONER MCALLISTER: Yeah, that's
20 really interesting.

21 MS. BEDSWORTH: Yeah.

22 COMMISSIONER MCALLISTER: Bob, did you
23 want to --

24 MR. RAYMER: Thank you, Mr. Chair and
25 Commissioners. Earlier today, we were sort of

1 going through the panelists very quickly and
2 perhaps I didn't get enough into the weeds.

3 The community solar program that I'm
4 referring to, when the Energy Commission adopted
5 the new regulations back in May, in addition to
6 doing the solar mandate, in Part 6 of our energy
7 regs, they adopted a page-and-a-half of sort of
8 skeletal regulatory structure that sets up a new
9 option for the builder, known as community solar.
10 Those administrative regs do not limit it to --
11 it's not a requirement that the builder own and
12 operate the solar farm. It could be a city or
13 county. It could be a third-party solar entity.
14 Most importantly, it could be the utility.

15 And case I point, SMUD is already kicking
16 off what they call a SolarShares Program. The
17 regs require that there be up-front financial
18 advantage to the homebuyer from day one. So
19 there's a financial commitment that the builder
20 makes to SMUD, I think it's to the tune of \$400 a
21 kilowatt. So in Sacramento, we've got to do
22 three kilowatts on average.

23 The bottom line, though, is this is an
24 opportunity for the electric utility to continue
25 to be the electric utility. It makes it far less

1 difficult from a logistics standpoint for the
2 builder to have to worry about this and that and
3 ordering this and making sure it's the right
4 price over here. At the same time, the utility
5 already has the infrastructure. They get to
6 remove a credit, et cetera. So there's so many
7 advantages to this. What we're trying to do is
8 now look at the IOUs for this.

9 But more importantly, if we can get this
10 to work, for new residential, this is the
11 blueprint for existing housing, existing
12 commercial and new commercial. There's no way,
13 you know, for a 15-story commercial building in
14 Oakland that may need nine-and-a-half acres of
15 solar, you know, we calc'd it out, you're not
16 going to be able to do that, and so we've got to
17 figure out how to get this done.

18 We would love to see the utilities
19 continue to be the utilities. That's probably
20 the easiest business model here. So we'll be
21 working on that for the next 12 months.

22 MS. BEDSWORTH: Okay. Well, then with
23 that, I will thank all of the panelists in both
24 rounds. We really appreciate all the
25 information. Thank you.

1 MS. RAITT: Thanks.

2 CHAIR WEISENMILLER: Thanks for your
3 participation.

4 MS. RAITT: This is Heather. And so I
5 think if Commissioners are ready, we could move
6 on to the public comment period. So I don't have
7 any blue cards, but I don't know if there's
8 somebody in the room who would like to make
9 comments?

10 Do we have anybody on WebEx? All right.
11 All right.

12 Okay, it looks like we don't have anybody
13 in the room who wanted to make comments. And
14 nobody on WebEx.

15 Can we open up phone lines, just quickly?
16 So if you're on the phone, please mute your line,
17 unless you wanted to make a comment. Okay. I
18 think we're hearing background.

19 So I don't think we have any public
20 comment.

21 And then I'll just remind everybody, the
22 written comments are welcome and they are due on
23 January 31st, two weeks from today.

24 CHAIR WEISENMILLER: All right. And I
25 wanted to thank people for helping us kick off

1 the new IEPR. Certainly, interesting
2 conversation today, really highlighted we need to
3 deal with and do better co-locating housing and
4 workplace and reducing transportation. All
5 right. Yes. So we just wanted -- yes.

6 Anyone else? Meeting is adjourned.

7 (Off the record at 3:09 p.m.)
