## **Electrification Please!**

I support a major push to all electric buildings. As an Architect, I already advocate for high efficiency heat pumps and induction stoves in all buildings, both existing and new. We need an incentive structure that rewards the adoption of electric cooking, power and heating and that aligns tariff pricing and energy costs with green house gas emissions. Utilities should hook up 200amp power to homes free of additional charge to incentivize heat pump conversions and induction stove use. Especially for existing renovations. Biogas is not a sufficient option and supply is limited. Biogas with carbon capture and storage is not a mature technology and slowly increasing the supply of biogas in the supply is inadequate to address the problem. The earlier we start reducing greenhouse gas emissions, the easier. Lastly, it is not cost effective for a utility to only supply gas to a home for stove use if the rest of the house is already electric. Induction stove use needs to be promoted.
