Dear California Energy Commission,

We drive 2 EVs and have recently installed solar on our home, and we are so happy to have made this decision. The state should. While each individual makes an impact to move towards clean energy, the State's impact makes a major difference in both setting an example for other states and the people that live here. In this day and age, there is no need to rely on old technologies to power our needs - especially in a resource Rich state like we live in. Let's make this more away from methane now!

Dear Commissioner:

California has already pledged to generate all of its electricity through clean renewable energy by 2045. A quarter of California's greenhouse gas emissions are from homes and buildings, the majority of which come from onsite combustion of methane gas for heating. To meet its climate goals, the state must phase out the use of gas in our homes and buildings entirely.

California cannot afford to slow down its pace in transitioning from dirty methane gas to clean electricity in homes and buildings. Clean alternatives, such as solar and wind, are ready and are California's best hope for avoiding more devastating climate impacts.

I strongly encourage the Energy Commission to stay on track with California's climate targets and work towards phasing out gas entirely and rapidly.

Thank you.

Sincerely,

Alex Gutt
