Transition ASAP away from Methane Pollution

There are many risks from the continued use of natural gas--air pollution and explosions and climate temperature forcing. It is outrageous that CPUC lets reports of leaked methane carry over from one year to the next that accounts for 7-12% of natural gas transported. The sooner we kick this terrible habit the better. In my business we cut our natural gas use by 90% 7 years ago with solar hydronic heating of our production buildings. We continue to electrify more things. It is essential that businesses invest in electrifying everything. It is essential to convert all the LNG buses to electric. There is no information reaching people about how important this is. If CARB would put a real price on natural gas at the social cost set by the CPUC on May 16, people might finally start getting the message.
