PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

1	PROCEEDINGS
2	2:05 p.m.
3	PRESIDING MEMBER PFANNENSTIEL: I'm
4	sorry we're a few minutes late, but I think we can
5	get moving. This is the Efficiency Committee
6	workshop on energy efficiency standards,
7	specifically for televisions, that we will address
8	today.
9	And we have an agenda that's been
10	circulated and do some technical discussion at the
11	outset. So, why don't I turn it over to Melinda
12	to get us started.
13	MS. MERRITT: Okay. Good afternoon,
14	everybody; I'm Melinda Merritt with the appliance
15	efficiency program staff. And I'm the Project
16	Manager for the 2008 appliance efficiency
17	rulemaking.
18	First and foremost, I guess I need to go
19	over the standard housekeeping items for
20	everybody. For those of you not familiar with the
21	building, the closest restrooms are located out
22	the door and to the left. There's a snack bar on
23	the second floor.
24	Lastly, in the event of an emergency and

the building is evacuated, please follow our

1 employees to the appropriate exits. We would

2 reconvene at Roosevelt Park, which is kitty-corner

3 to our building. And please proceed calmly and

4 quickly, again following the employees with whom

5 you are meeting, to safely exit the building.

have received this afternoon.

23

So, with that requirement handled, there are copies of the agenda and the workshop notice for today in the foyer, and a limited number of copies of the documents that have been posted to date, and some copies of the presentations that we

All comments on this subject that we've received so far have been docketed on our website, and we will be posting the slide packs used in today's presentations, along with any additional comments received following today's workshop.

This workshop is being recorded and a transcript will be posted within the next two weeks. This meeting is being broadcast over the internet, and anyone wishing to participate by phone may call in the following number: 1-888-283-3870; the passcode is appliance; call leader Melinda Merritt.

Without further ado, this workshop is considering possible appliance efficiency

```
1 standards for televisions in the active mode. And
```

- the agenda I have up here on the screen for
- 3 reference. Our first presentation this afternoon
- 4 will be from PG&E and Energy Solutions on their
- 5 analysis of standard options for televisions.
- 6 With that, Alex Chase.
- 7 MR. FERNSTROM: So before Alex starts,
- 8 if I may, I'd like to give a brief introduction.
- 9 This is Gary Fernstrom representing PG&E. And we
- 10 all know that California has ambitious
- 11 environmental and energy efficiency goals for the
- 12 state.
- 13 We also know that consumer electronics,
- 14 particularly televisions, are representing a
- growing end use in the state of increasing
- 16 electrical demand and relatively long hours per
- day of usage resulting in considerable energy use.
- 18 So, PG&E, the Sempra Companies, San
- 19 Diego Gas and Electric, NRDC are advocating
- 20 collectively for what we believe are some modest
- 21 appliance efficiency expectations for these
- 22 products. And Alex is going to talk about this in
- 23 detail.
- MR. CHASE: Thanks, Gary; and thanks for
- 25 the opportunity to present today. I have a number

of slides today. We're going to officially submit

- 2 them so they're on the docket. Due to time
- 3 constraints I won't be able to get into every
- 4 single one of them. So, for some of them I'll
- 5 spend some time on. For others, I will simply
- flash, but they will be available online.
- What I'd like to do is to give a quick
- 8 background on the PG&E proposal and endorsed by
- 9 the other IOUs, provides -- spend some time on the
- 10 market and energy trends for televisions.
- 11 Then I'd like to get in specifically
- 12 talk about some efficiency developments, both for
- 13 LCD and plasma tvs currently on the market.
- 14 The next section focusing on LCDs and
- plasmas, talk about some of the efficiency
- developments that are being showcased today that
- 17 as trends continue, it seems will be available on
- 18 the market within the next couple years to months.
- Then I'll spend a little bit of time on
- 20 retail programs and incentive programs. Won't
- 21 spend a whole lot of time on that because Tim
- 22 Michel from PG&E will be giving a presentation
- 23 after me giving some details on the utility-
- 24 sponsored incentive programs for televisions and
- other consumer electronics.

Then, time considering, we will -- I'll 1 step back and kind of give a broader motivation, 2 as Gary mentioned, the California energy 3 4 efficiency goals and the greenhouse reduction 5 goals, and try to provide some context for this 6 television standard. Then we'll have some conclusions. I 8 have a full appendix with additional slides that will be available online, as well. 10 Starting out with the television proposal background, PG&E first indicated that it 11 was working on a television case report at the 12 13 January 15th workshop. Submitted a formal 14 proposal, case report, April 1st of 2008. 15 July 3rd we submitted a revised proposal that is endorsed by all the IOUs. The case report 16 focuses solely on mode power since California 17 already has a standard for maximum standby at 3 18 19 watts. 20 Just to give a broader sense of what 21 data we relied on to inform our analysis, 22 initially for the April 2008 case report, we were

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

23

24

25

primarily relying on two sets of tv test results.

One from the EnergyStar and another set of tests

that were performed by ECOS Consulting for the CEC

- 1 PIER project.
- 2 Between those two datasets there's about
- 3 245 datapoints. Since then we've gotten
- 4 additional datapoints from CNET and then of some
- 5 datasets from Europe. All total, there's about
- 6 762 datapoints.
- 7 Now, I think it's important to note that
- 8 all the datasets are different. They all have
- 9 different distribution technologies between LCD,
- 10 plasma, rear projection, CRTs. The screen sizes
- 11 are different between all the different datasets.
- 12 For the most part they all have used the
- 13 internationally accepted IEC test procedure, with
- 14 the exception of CNET. The manufacturing date and
- the availability date, there's a difference
- 16 between all the different data sets probably
- 17 ranging anywhere from 2005 all the way to models
- 18 that aren't available on the market right now.
- 19 So, all attempts have been made to
- 20 represent what's available on the market now, and
- 21 what's available in the near future We're using
- these datasets plus some of the efficiency
- 23 developments that are being showcased by many of
- 24 the major brands and manufacturers to inform the
- 25 analysis.

```
The revised proposal is a two-tier

standard. We're recommending that tier one is

effective January 1, 2011; and tier two is

effective January 1, 2013.
```

It is based on the screen area of the television, and it's separated into non-high-definition televisions and high-definition and full-high-definition tvs. The breakpoint there is 480 native vertical resolution.

With the exception of these proposed levels all the other recommendations in the April case report stand, and continue to make -- to support those recommendations, specifically for using EnergyStar's guidelines for testing and certifying tvs with automatic brightness control and its guidance for testing tvs at factory default settings.

This is a graphical representation of the proposal. It also includes the EnergyStar specification which is finalized and will become effective November 1, 2008. So I'll spend a bit of time on this.

On the vertical axis is maximum on-mode power. And on the horizontal axis is screen area in square inches. The green line is the

```
1 EnergyStar line. And you'll see it's kind of a
```

- 2 lightning-bolt shape. It starts up, and once it
- 3 hits about roughly 40 inches, there's a step up in
- 4 power. And then it's another straight line. And
- 5 then a greater-than-50-inches, there's another
- 6 step up.
- 7 What we've done for tier one is to take
- 8 kind of the segment for the smaller screen sizes
- 9 and have continued that slope all the way up.
- 10 For tier two, again this is just for
- 11 high-definition televisions. For tier two it's a
- 12 bit advanced and we're recommending that it
- becomes effective January 1, 2013.
- 14 Getting to some market trends, primarily
- 15 line from a leading market research firm, Display
- Search. This graph here shows 2006 through 2012,
- and then unit share is the vertical axis.
- 18 The green line here that kind of ramps
- 19 up and then levels off is Display Search estimates
- 20 for LCD televisions. They show that it's rapidly
- 21 growing and they estimate that it will flatten out
- 22 roughly below 90 percent. Plasma displays are
- showing a relatively flat market share at roughly
- 24 10 percent. CRTs and rear-projection televisions
- 25 have been declining and their market shares are

1 minimal. OLEDs are showing opposite trend. Their

- 2 marketshare is growing, but it's still at a
- 3 relatively small percentage.
- 4 So, therefore, when we were assessing
- 5 energy savings we primarily looked at LCD and
- 6 plasma televisions since they represent, you know,
- 7 close to, by Display Search estimates, you know,
- 8 roughly 97 percent or more of the market
- 9 specifically when our proposed standards were
- 10 taking effect 2011 or beyond.
- 11 The screen size projections, this again
- is from Display Search, for different regions
- 13 across the world, North American is the top blue
- 14 line showing from 2006 to 2012. Display Search
- 15 estimates that the average screen size is roughly
- 16 35 inches today.
- 17 There's some competing views on this.
- 18 The figure on the left shows a press release from
- 19 Sharp. They said that they anticipate the average
- 20 tv size would be up to 60 inches by 2015. The
- 21 figure on the right is a press release from LG,
- 22 and they see strong demand for smaller tvs,
- 23 particularly for second tvs that would kind of fit
- 24 in places that CRTs normally would not. But now
- 25 that they have the smaller form factor that, you

1 know, you can put these in the kitchen or in a 2 secondary room.

1.3

Won't spend a whole lot of time on this graph. This shows television end use growth rate, its various residential end uses. The size of the bubble indicates the relative portion of the end use in a residential application. This is all for the United States based off of EIA 2008 data.

The horizontal axis is kind of the average annual growth rate for the last three years, 2005 to 2008. The vertical axis shows projected growth rate between 2008 and 2030.

So, generally, the further it gets in the upper right-hand quadrant, shows larger growth. I've highlighted -- the red segments here are largely dominated by consumer electronics, televisions is this dot here. You'll notice that lighting is showing a negative growth between 2008 and 2030, largely due to the impacts of the 2007 EISA federal energy bill.

Based off of an analysis of the dataset, we tried to choose televisions that were available in 2007 or later. This is a linear regression of LCDs in blue, and plasma in red. The yellow dotted line is the proposed tier one level.

You'll see the plasmas appears in the
red here, generally trending as a much larger band
in terms of spread of efficiencies between various
models. Of course, plasmas generally tend to be
larger size televisions. And the dataset trends
show that on average the on mode power is greater
than LCDs.

1.3

LCDs are shown here in the blue. They tend to be a bit more tighter in terms of the spread of offload power as a given screen area.

And, again, this is just for plasma and LCDs that do not meet the tier one standard. So we used this as the basis for calculating energy savings.

This shows the opposite. This shows televisions that qualify for the proposed tier one level. Right now just LCDs are shown. You can see that there's a number of LCDs that fall below the tier one line. And we use this, again, to estimate savings for LCDs in tier one.

Now, I have in bold and red, the figure does not fully reflect the energy efficient tvs, specifically both for LCD and plasma technologies that are currently entering the market and/or being publicly promoted and showcased by several major manufacturers, which is what I want to get

- 1 into next.
- There's a balance between assessing the
- 3 dataset that we have, which relies on tvs that
- 4 were tested. The tvs were available in 2007 or
- 5 later. But it doesn't reflect some of the tvs
- 6 that are entering the market now, and some of the
- 7 more efficient technologies being promoted.
- 8 So, this particular section, I want to
- 9 just briefly touch on just a couple examples of
- 10 LCDs entering the market now. Philips, the EcoTV.
- 11 This was awarded the best in show at the January
- 12 consumer electronics show.
- 13 They currently estimate a 90 watt on-
- mode power, which is roughly 56 percent better
- than EnergyStar and 50 percent better than the
- original -- or 50 percent, that should say, better
- than the tier one Title 20 level.
- 18 Philips -- this EcoTV is now available
- in three modes -- three models in 42 inch
- 20 televisions. It's also available in 47 inch and
- 21 52 inch.
- 22 Sony released a 32-inch tv that it says
- 23 achieves industry's highest energy efficiency in
- 24 the Japanese market. I believe it's referring to
- the Top Runner program. They claim that it's 89

1 watts power consumption, which is roughly 25

- percent beyond the tier one level.
- 3 The plasmas on the market today, I want
- 4 to spend some time on this section because it's
- 5 important for some of the recommendations that
- 6 we're making. Particularly on screen setting
- 7 impacts of plasmas.
- 8 So, again, I want to reiterate, these
- 9 are -- the next couple slides will show plasma tvs
- 10 that are currently available on the market today.
- 11 Typically the default screen setting for
- tvs, also knows as kind of the out-of-the-box
- setting, is set to have a high light output which
- 14 generally results in a correspondingly high power
- 15 consumption.
- 16 Informally, sometimes, this mode is
- 17 referred to as torch mode. Different
- 18 manufacturers have names for this. They may refer
- 19 to it as vivid or dynamic. It's generally ideal
- for a retail shop setting because it needs to
- 21 compete with the other tvs in the shop. But it's
- 22 not necessarily calibrated for the optimal home
- viewing.
- 24 So, if you look at specific tvs on the
- 25 market today, and the difference between kind of

1 this quote-unquote torch settings and some of the

- 2 better calibrated settings for home use, the
- 3 difference is significant. It can range anywhere
- from 27 to 65 percent for the nine plasma tvs that
- 5 I'm going to show.
- 6 This is one pathway that plasma tvs on
- 7 the market today can meet tier one. It's a zero
- 8 dollar hardware cost pathway. The televisions
- 9 that I want to show are available from all the
- 10 leading manufacturers, Panasonic, Samsung, LG,
- 11 Hitachi, Pioneer, Vizio, Insignia. I'm going to
- show a couple of them in this presentation, and
- the rest are shown in the appendix slides.
- 14 The slides are based off of CNET test
- 15 results in about 100 or so tests that they've been
- doing, tv power consumption tests, all the way
- 17 back to 2006. They started about mid 2007 testing
- 18 at various screen settings. Right now they call
- 19 it default-calibrated power save, if there is a
- 20 specific power save screen setting available on
- 21 the television.
- 22 As I noted before, CNET didn't use the
- 23 IEC test procedure. Primarily because they
- 24 started testing before it was finalized. But the
- 25 results are valuable primarily because it's one of

1 the few datasets that we can look at to make some

- assumptions in terms of what tvs are on the market
- 3 today. The majority of the datasets we don't know
- 4 the brand name or model number because that has
- 5 been scrubbed, particularly for the EnergyStar
- 6 dataset.
- 7 So this is useful information. We
- 8 recognize that the test results haven't been --
- 9 the tests haven't been collected using the IEC
- 10 test method. So what we did is we went to CNET
- 11 and asked them if we could test some of the same
- 12 televisions using the IEC test method. And we
- 13 just did that on Monday, and we confirmed that
- 14 there is a difference.
- 15 For the plasmas, the trends that we're
- seeing is generally, if anything, the CNET test
- 17 results overstate power consumption relative to
- 18 IEC if they were tested in the IEC test procedure.
- 19 So these results may overstate, which is generally
- 20 a good assessment in terms of making some
- 21 assumptions about whether plasma tvs on the market
- 22 can meet the tier one levels.
- 23 As I mentioned, CNET tested about 104
- 24 tvs. Fifteen plasmas have been tested in these
- various screen settings, and that's what we based

- 1 the results off of.
- 2 Nine of those, 60 percent, would be able
- 3 to meet the EnergyStar level in a kind of a lower
- 4 power picture mode, or kind of a better calibrated
- 5 picture mode. Roughly half, 47 percent, seven out
- of the 15, would be able to meet the tier one
- 7 proposed level for Title 20.
- I won't spend a whole lot of time on
- 9 this, but if you want to get the specific details
- in terms of how we're drawing our conclusions, we
- 11 have it in table form here.
- 12 A quick example. This is a 50-inch
- 13 plasma from Hitachi. I should note all the slides
- 14 I've tried to provide links to where I got the
- data, so folks can double check.
- But this is just screen shots from CNET.
- 17 Shows the product review and then what they've
- 18 labeled their juice box. At the bottom of each
- 19 review is the picture setting. So in this
- 20 particular one you can see on the right there's
- 21 the onmode watts for default calibrated power
- 22 mode.
- 23 And CNET has indicated -- they test
- roughly between 60 and 80 televisions per year.
- They've indicated they're going to start using the

1 IEC test procedure going forward. So that will be

- 2 beneficial in terms of customers understanding
- 3 power consumption of televisions.
- 4 I spend a couple -- on this graph so you
- 5 can kind of get a framework of what we're trying
- 6 to show here. Again, this is similar to the
- 7 levels that I showed before. Again, screen area
- 8 on the horizontal axis, and on-mode power on the
- 9 vertical axis.
- I show the EnergyStar tier one level in
- 11 the blue line; the yellow dotted line is the Title
- 12 20 tier one. In essence, any television that
- 13 falls below these lines would qualify for those
- 14 corresponding levels. If it falls above that
- line, it would not meet that specific level.
- So show you the range of how the screen
- 17 setting impacts on some plasmas. This Hitachi in
- 18 default mode, the brightest mode or the torch
- 19 settings, kind of falls just above the EnergyStar
- 20 level. At a calibrated mode, you know, CNET tried
- 21 to calibrate this for optimal home viewing. It
- falls below the EnergyStar level and below the
- tier one level. At a power-save mode it's
- 24 significantly less than the tier one mode.
- This is a 50-inch plasma from Vizio.

```
1 This one doesn't have a power-save mode, so it's
```

- just the default and the calibrated. You'll see
- 3 in the default mode it falls right on the
- 4 EnergyStar line. In the calibrated mode it falls
- 5 a fair amount below the tier one line.
- 6 And, again, as I mentioned earlier,
- 7 preliminary results using the IEC test method
- 8 would probably drop these points even further
- 9 below the lines.
- 10 Panasonic has released a 50-inch
- 11 television in May of this year, I believe. And
- this is one of the first televisions that's kind
- of addressing the screen-settings mode. And I
- think they can be commended for it.
- 15 When you first plug it in, you know, as
- 16 a typical user if I went out and bought this
- 17 television I'd plug it in. And the first screen
- 18 shot that would come on would ask if I'm in a
- 19 store or home environment.
- 20 If I choose a home setting then it puts
- it in a calibrated mode that's best for home
- 22 settings. If I choose a store setting it would
- 23 default to this vivid preset, which would be the
- 24 brightest mode.
- So, here's the difference now. Now that

1 it has this forced menu, this home settings kind

- of becomes the default settings. And clearly it's
- 3 well below the tier one level. Even at the vivid
- 4 settings it's below the EnergyStar, but doesn't
- 5 quite meet the tier one level.
- 6 So this is, as I mentioned, kind of a
- 7 zero dollar pathway to meeting tier one levels for
- 8 plasmas. It's not the only way they can get
- 9 there, of course, but I just wanted to highlight
- 10 some of the plasma tvs currently on the market
- 11 that are starting to do this. As I mentioned
- 12 earlier there's, I think, six other examples that
- 13 we show in the appendix.
- 14 The LCD efficiency developments, I want
- 15 to showcase some products from major brands.
- 16 Largely this is taken from the Display Week 2008
- 17 Conference that was held in L.A. back in May of
- 18 this year. Manufacturers were proudly displaying
- 19 their latest televisions and promoting the energy
- 20 efficiency in those.
- 21 Here's a couple photos from the
- 22 conference. And generally, you know, these were
- 23 prominently displayed right when you walked in.
- In general, what the manufacturers did was show
- 25 kind of their conventional television compared to

```
1 their more advanced energy efficient television.
```

- 2 And typically they would show the on-
- 3 mode watts. And it was a dynamic display. So,
- 4 depending on the content on the screen, this would
- 5 adjust. They're showing the same settings. So
- 6 this isn't necessarily indicative of the test
- 7 results for if it was tested in the IEC test
- 8 procedure, but it does show you the dramatic
- 9 advances in energy efficiency.
- 10 This is a Samsung 52-inch LCD green tv.
- 11 You can see the conventional, at this moment in
- 12 time it was 210 watts compared to 122 watts in the
- advanced. AUO is a panel maker. They had a 46-
- inch ecofriendly LCD tv; 252 watts compared to 122
- 15 watts. Showing the same content.
- Samsung had a 46-inch LCD with three-way
- dimming. In this particular content it was 184
- 18 compared to 48 watts. This is the same tv
- showing, you know, 184 compared to 109 watts.
- 20 So the content certainly does impact the
- 21 onload power, but the relative difference is
- 22 significant.
- 23 Upper right is a 40-inch LCD using the
- 24 3M Vikuity display enhancement. On the left it's
- 25 showing 195 watts, both -- on the right it's

```
1 showing 92 watts. On this particular one the
```

- 2 brightness remains the same at 350 nits. This is,
- 3 again, a 32-inch using the same 3M technology
- 4 showing 60 watts for a 32-inch panel. CMO had a
- 5 non-high-definition 31.5-inch LCD. Again, about a
- 6 50 percent reduction, 106 watts for the
- 7 conventional and 52 watts for the more advanced.
- 8 Here's another slide of the Vikuity
- 9 showing kind of what the technology is aiming to
- 10 do. It's a brightness enhancement film that
- 11 allows more light out of the LCD and can, in
- 12 essence, eliminate some of the backlights, and
- subsequently reduce the power supply power.
- This is a press release from AUO
- 15 promoting the ecofriendly LCD tv panel. Due to
- 16 time I won't get into all the specifics on this,
- 17 but you can go back and read this.
- 18 Some folks may not recognize some of
- 19 these names. AUO is a panel maker. You know,
- some of their top customers are a bit more
- 21 familiar to the average person out there. You
- 22 know, they sell the Sony, Samsung, Philips, LG.
- 23 CMO was highlighted. Samsungs. These
- 24 are definitely some of the major panel makers out
- 25 there and the major brands are buying panels from

- 1 these folks.
- 2 So I wanted to show roughly how these
- 3 televisions would compare to our proposed tier one
- 4 and tier two levels. These next generation LCDs
- 5 exceed the tier one level by roughly 28 to 58
- 6 percent. So, in essence, they're more efficient.
- 7 And they exceed our tier two levels by 8 to 33
- 8 percent.
- 9 So, again, a similar graphic with the
- 10 EnergyStar level, the tier one level and the tier
- 11 two level. The small dots are LCD tvs. You see
- there's a range of them that fall above and below
- 13 the tier one level, and some below the tier two
- 14 level. These are all tvs on the market today.
- 15 These large green dots all represent the
- 16 televisions that I just showed. So, again,
- 17 roughly anywhere from 28 -- I'm sorry, for the 28
- 18 to 58 percent improvements beyond tier one, and
- anywhere from about 8 to 30 percent improvements
- 20 beyond tier two.
- 21 The next section I want to get into some
- of the showcase products and efficiency
- 23 developments on the plasma side. Again, we
- focused primarily on LCD and plasma, as I
- 25 mentioned earlier, because they definitely are the

dominant players with LCD approaching 90 percent

- 2 market share, and plasma stands steady around 10
- 3 percent.
- 4 So then the slides I want to show in
- 5 particular are the double efficiency technology,
- 6 also known as the neo PDP, being promoted by
- 7 Panasonic, the leading plasma brand.
- 8 Shows similar comparisons of how it
- 9 would match up with EnergyStar and the proposed
- 10 Title 20 levels. And then some additional plasma
- 11 efficiency developments.
- 12 In the January consumer electronics show
- 13 Panasonic introduced their next generation plasma
- 14 displays. In this particular press release it
- says, the 42-inch prototype has twice the
- 16 luminance efficiency and provides the same
- 17 brightness as the existing 42-inch -- full high-
- definition plasma display panel while cutting the
- 19 power consumption by half.
- This is available on the Panasonic
- 21 website. This is a reference year to 2004. They
- 22 said, you know, in roughly 2007 they've reduced it
- 23 almost to a half. And eventually the reduction
- 24 will reach about one-fourth.
- 25 Again, this is from the Panasonic

1 website. The footnote says these are expected to

- 2 be available after the new plasma display panel
- 3 factory is completed in 2009.
- 4 So, we did an assessment assuming that
- 5 the manufacturer claim is correct, that they can
- 6 reduce the power by 50 percent compared to their
- 7 current models, we plotted that. So, again, since
- 8 CNET is really the only dataset that we have that
- 9 we can particularly pick out a specific brand and
- 10 model number, we picked out the three 42-inch
- 11 plasmas that have been tested from Panasonic.
- 12 They all fall above the EnergyStar and tier one
- 13 lines today.
- 14 If you plot a 50 percent power
- 15 reduction, as they claim, all of them would fall
- below the tier one level easily.
- MR. FERNSTROM: Alex, this is Gary from
- 18 PG&E. Just a clarification question on that last
- 19 slide.
- 20 That would mean that in addition to this
- inherent energy savings, if these sets were
- 22 factory default to home environment, rather than
- 23 store environment, the power demand would be even
- 24 lower?
- MR. CHASE: That's my understanding. If

a representative from Panasonic wants to clarify 1

that, that'd be helpful.

2

16

17

18

19

20

21

There's been certain claims, I'm trying to get a better understanding in terms of what the true reference is. They've made some claims that it's 50 percent beyond current models. So, presuming it's 50 percent, from 2007, another slide I'll show that, you know, 50 percent improvement from 2008 models.

> So the combination of this technology that they're promoting, with the more calibrated screen settings, you're correct that it probably would drop these results even lower.

This is, you know, one of the points that I just showed here, you'll see that, presuming it can get a 50 percent improvement compared to models on the market today. And again, this is potentially over-stated, because as I mentioned earlier, these are CNET test results. And the trend is it's a little bit higher than what you would get using the IEC test procedure.

22 So they're basically sitting right on the tier two level And this is four and a half 23 24 years before the proposed effective date for tier two of January 1, 2013. So we thought carefully 25

```
1 about this, and we recognized the great
```

- 2 improvements of efficiency, but wanted to, you
- 3 know, give adequate time to industry to meet this
- 4 level. Which is why we chose 4.5 years from now.
- 5 This is the panasonic television being
- 6 displayed about two months ago during the CHI-Tech
- 7 (phonetic) 2008, which is the international high
- 8 tech expo in China.
- 9 Similar to some of the previous photos I
- 10 showed, although the only thing you can read is
- 11 the 42-inch here. But the conventional on the
- 12 right, and the more efficient model on the left.
- 13 The CNET released a story saying, you
- 14 know, you may have read about Panasonic's Neo-PDP
- 15 plasma technology, may even have caught a glimpse
- of the prototypes at January's consumer
- 17 electronics show in Las Vegas. Well, we now have
- 18 news that they could be coming to an electronics
- store near you as early as June 2009, according to
- 20 a spokesperson at the recent Panasonic Tokyo/Osaka
- 21 tour that CNET-Asia was invited to.
- 22 Again, if anyone's from Panasonic here
- that wants to correct that, that would be helpful.
- 24 But again, indications are that these new
- 25 efficient panels will be available basically next

1 year. Several years before tier two would become 2 effective, as we're recommending.

This is a slide from a President of

Panasonic, given in February 2006, highlighting

the same technologies I just showed. A couple

things I just want to mention is they're promoting

that this, you know, they're using new materials,

new processes, new design and new drive. And, you

know, they're claiming that it results in energy

savings, higher image quality, ultra-large screen,

thin profile and lower cost.

1.3

Pioneer and Panasonic just merged a couple months ago. And in this particular article the partners hope to create, by 2010, a large-screen, PDP tv whose power consumption will be slashed by two-thirds, compared to PDP's tvs of 2007. While infinitely increasing contrast and reducing thickness to less than an inch.

So, again, this is, you know, some press releases say 50 percent beyond 2007. This particular one says slashed by two-thirds compared to 2007. So, it's not complete clear what the baseline is, but it's pretty evident that they have some pretty commendable efficiency developments that they're showcasing.

1	There's more slides in the appendix
2	showing efficiency developments across the
3	industry, as well, if you're interested in seeing
4	those.
5	So, how do retailers fit into this? You
6	know, our sense, looking at the trends, is some
7	will use their purchasing power to move the market
8	towards higher efficiency. And others will be
9	incentivized to sell these energy efficient
10	televisions by participating in incentive
11	programs, which will be discussed in the next
12	presentation by PG&E Program Manager Tim Michel.
13	One example is WalMart. This is taken
14	from the CEO of WalMart, Lee Scott, in his address
15	to the company in early 2008. They've announced
16	some pretty dramatic goals in terms of where they
17	want their suppliers to be by 2010.
18	One of those they specifically mentioned
19	that they want by 2010, the flat panel televisions
20	will be 30 percent more efficient. So, again,
21	some of the major retailers are pulling the market
22	this way, as well, which will kind of pave the
23	way, so to speak, for industry to meet these

25 Stepping back to provide some kind of

proposed tier one and tier two levels.

```
1 higher level motivation in regards to the
```

- 2 California efficiency goals, and the greenhouse
- 3 reduction goals. Wanted to provide some context
- 4 of where this television standard could help the
- 5 State of California to meet those goals.
- As a lot of folks know, and, of course,
- 7 the Commissioners know, AB-32 established that
- 8 California would need to be at 1990 levels by 2020
- 9 in terms of emission levels. The electricity
- 10 sector is going to be responsible for about a
- 11 quarter of those goals.
- 12 Interesting fact that I pulled out of a
- 13 recent report, on a per capita basis this would
- 14 basically mean we're generally around 14 tons of
- 15 carbon dioxide per person right now. To meet this
- goal we'd need to get down to about 10 tons per
- person by 2020. Fairly ambitious.
- 18 Again, a lot of folks know, CARB is
- 19 responsible, the California Air Resources Board is
- 20 responsible for developing a plan of how
- 21 California's going to get to AB-32 goals. This
- 22 was released in June 2008. It's the discussion
- 23 draft. It's called The Climate Change Draft
- Scoping Plan, pursuant to AB-32.
- In the executive summary they list some

```
of the key elements of the plan to reach 1990
```

- levels by 2020. It's notable that the first
- 3 bullet point is the expansion and strengthening of
- 4 existing energy efficiency programs and building
- 5 and appliance standards.
- 6 Getting a bit more detailed, they lay
- 7 out on a sector-by-sector basis what the reduction
- 8 goals are. Total across California there needs to
- 9 be 169 million metric tons of CO2 equivalent by
- 10 2020.
- 11 26.4 or 15.2 percent of that total goal
- is roughly slated from energy efficiency,
- including appliance standards. Doing some
- 14 potential statewide energy savings from this
- 15 recommended tier 1 and tier 2 levels. If tier 1
- and tier 2 become effective, there's a potential
- to get about 3.5 million metric tons of CO2
- 18 equivalent reduction.
- This 3.5 is roughly 2 percent of the
- total AB-32 goal, and about 13 percent of the
- 21 energy efficiency component of that total.
- 22 Some folks have seen this slide, as
- 23 well. This is a study conducted by McKinsey in
- 24 2007. This is particular for the U.S., but it,
- 25 you know, certainly applies to California.

They did an assessment of all different strategies to reduce greenhouse gases. And they did it based off of total potential in terms of CO2 reductions. And then the actual cost to achieve that.

Anything that falls below the horizontal line they indicate could be achieved at a negative cost to society. Residential electronics and commercial electronics are notably on the very far left there. So, McKinsey is recognizing this as one of the most cost effective pathways to greenhouse gas reductions.

The California long-term energy efficiency strategic plan which was finalized just recently in July, they lay out a vision for codes and standards providing a broad range of aggressive and continually improving energy codes and standards.

They lay out some goals to achieve that.

One of the near-term goals in 2009 through '11

specifically is to expand Title 20 to cover

additional plug loads such as copy machines,

printers, battery chargers and televisions. So,

again, this falls in line with some of the

statewide goals here.

```
1 Some of the broader goals. They have a
```

- 2 three-part vision, all cost effective, reliable
- 3 and feasible energy efficiency measures and
- 4 actions are implemented in integrated systems, the
- 5 whole-building approach.
- 6 Strategies, programs, measures,
- 7 institutional structures must provide long-term
- 8 energy savings and energy efficiency will generate
- 9 significant reductions in greenhouse gases.
- 10 We feel the television standard
- 11 addresses all three of these strategic visions
- 12 laid out by the state. There's --
- 13 PRESIDING MEMBER PFANNENSTIEL: May I
- just check something?
- MR. CHASE: Yes.
- 16 PRESIDING MEMBER PFANNENSTIEL: On this
- 17 slide, before you say the energy efficiency
- 18 strategic plan is final. I thought it was just a
- 19 draft; I thought it came out in draft yesterday.
- Or a couple days ago.
- 21 MR. CHASE: You're probably correct. On
- the website it says final.
- PRESIDING MEMBER PFANNENSTIEL: Oh,
- 24 okay, thank you.
- 25 MR. CHASE: Part of that plan, there's

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

four big bold initiatives. Two of them, I think,

- tie into this proposed tv standard. One is that
- 3 all new residential construction in California
- 4 will be zero net energy by 2020. And all new
- 5 commercial construction in California will be zero
- 6 net energy by 2030.
- 7 A majority of these savings will be in
- 8 residential applications, but the trend is, as
- 9 most people probably know, is more and more
- 10 commercial applications, bars, hotels, are buying
- 11 televisions. Usually they're the larger size
- televisions, and they're operated for longer.
- Just some quick conclusions.
- 14 Televisions represent prominent and growing source
- of end-use energy consumption. Current growth
- 16 rates indicate that televisions are on a
- 17 trajectory to become a dominant, and in some
- 18 cases, the leading residential end use.
- 19 Addressing this load growth with
- 20 performance standards is a necessary approach for
- 21 California to achieve its ambitious energy
- 22 efficiency and greenhouse goals.
- 23 Tvs on the market today can meet and
- 24 exceed the proposed tier one level. This includes
- 25 tvs at various sizes, functionality and technology

Adopting a two-tier standard enables

1	types.

17

20

21

3	California to take advantages of the advanced
4	technologies entering the market and currently
5	being promoted, as I showed.
6	These technologies can meet or exceed
7	tier two levels today. And, as I mentioned
8	earlier, industry would have about 4.5 years to
9	prepare for those effective dates in 2013.
LO	So, in sum, by implementing this two-
L1	tier standard, California will certainly lead the
L2	nation and the world in advancing market
L3	transformation towards the most efficient
L 4	televisions.
L5	And that concludes my presentation.

16 PRESIDING MEMBER PFANNENSTIEL: Thank

you, Alex. Excellent. Questions?

18 ASSOCIATE MEMBER ROSENFELD: Excellent

19 presentation. I just wanted to make a

philosophical comment. These are very encouraging

numbers; the fact that power uses are coming down.

In 1974 when people first started

thinking about energy efficiency, a 15-foot

24 refrigerator used 200 watts. The standard that

came into effect in the late '90s was 18 cubic

```
feet and 40 watts. So it came down to a quarter.
```

- 2 Let's sort of hope this is a challenge to the
- 3 manufacturers that we can see the same sort of
- 4 wonderful progress in tvs.
- 5 But it's interesting now we're
- 6 discussing a field in which refrigerators are
- 7 almost insignificant compared to tvs.
- 8 PRESIDING MEMBER PFANNENSTIEL: Tim.
- 9 MR. TUTT: Yeah, Alex, I just had a
- 10 couple of questions. First, related to the whole
- 11 concept of changing settings, it's my
- 12 understanding, can you confirm, that the energy --
- 13 the IEC test procedure requires televisions to be
- 14 tested in the default setting?
- MR. CHASE: That's correct. .
- MR. TUTT: And who determines the
- 17 default setting?
- 18 MR. CHASE: If anyone in the room or on
- 19 the phone can correct me, but my understanding is
- 20 when a television is taken out of the box, that's
- 21 the default settings.
- MR. TUTT: So it's determined by --
- 23 MR. CHASE: If the lab technician is
- 24 using a television that the screen settings have
- 25 already been adjusted, then they need to put it

```
1 into what they determine as most likely the
```

- 2 default screen settings.
- MR. TUTT: So the --
- 4 MR. CHASE: Looks like a gentleman here
- 5 had a more specific answer on that.
- 6 MR. SHARP: My name's Mark Sharp with
- 7 Panasonic. My understanding is that the IEC test
- 8 procedure allows you to use, as a default setting,
- 9 the lower consumptive mode. It doesn't require
- 10 you to use that, but in order to meet EnergyStar,
- as a practical matter most manufacturers will opt
- to use the lower consumptive mode in order to help
- 13 them achieve that level.
- MR. TUTT: Okay. I guess my other
- 15 question there was how many different settings are
- there typically. And you mentioned in one slide,
- 17 you know, calibrated at home.
- 18 Is there a bar setting? Or does it vary
- by manufacturer?
- 20 MR. CHASE: It varies by manufacturer.
- 21 You know, some folks have movie settings, vivid,
- home, store, standard. I imagine some of the
- 23 folks from industry here could probably give a
- 24 better answer in terms of how many different
- 25 settings there are, and how those are determined.

MR. TUTT: And presumably there is a 1 lowest setting for each television that might 2 correspond to home, or might correspond to power 3 4 save. Is it PG&E's proposal that the default 5 should be established at that lowest setting? 6 is it some other version of the default? MR. CHASE: Well, you know, we 8 highlighted a couple plasmas on the market today that could meet the tier one level by just simply 10 adjusting those screen settings. We're not saying that's the only pathway that they need to achieve 11 that. 12 The research, in my understanding, is 1.3 14 that in the dynamic or the vivid or the torch

settings it might be ideal for retail, but it's generally not ideal for a home setting.

15

16

17

18

19

20

21

22

23

24

25

So, I think generally what we would like to see as one of the things that comes out of this is that kind of industry follows Panasonic's lead where when you plug it in it asks you if you're in a home or store environment. And then if you choose home, it puts it in kind of an optimal home requirement. It turns out that it's generally a lower power setting and can achieve the tier one levels.

1 MR. TUTT: You talked about the settings

- 2 issue in relation to plasma tvs. Is there a
- 3 similar kind of setting structure for LCDs, or
- 4 not?
- 5 MR. CHASE: There is. Good point.
- 6 Based off of the analysis that I've seen is screen
- 7 settings don't impact LCDs as much as plasmas.
- 8 Although it certainly could be a pathway, as well,
- 9 for LCDs to get there.
- 10 ASSOCIATE MEMBER ROSENFELD: Can you
- amplify that? I mean, as much as, doesn't quite
- tell you whether they're very insensitive, or half
- or -- I just don't have a clue what you're --
- 14 MR. CHASE: Sure. This is a slide that
- shows on the left-hand column there's clusters,
- one, two, three, four, five, six, seven. These
- 17 are all different plasma televisions. These are
- 18 LCD televisions, and these are rear-projection
- 19 televisions, tested at factory default, kind of a
- low power factory preset. And ISF calibrated,
- 21 that's Imaging Science Foundation, which generally
- is the experts in calibrating televisions.
- 23 Generally see, I believe, with plasmas
- 24 we were seeing spreads of anywhere from 28 to 65
- 25 percent between the higher power mode and the

```
lower power mode, based off of CNET test results.
```

- 2 For LCDs I think generally in the range
- 3 of zero to 10 percent. And I can get more
- 4 specific figures for you.
- 5 We didn't highlight the screen
- 6 setting --
- 7 PRESIDING MEMBER PFANNENSTIEL: Excuse
- 8 me, Noah, did you have a comment on that?
- 9 MR. HOROWITZ: Why don't you finish
- 10 alex. I just wanted to talk about the settings.
- 11 I've got the EnergyStar spec that talks about
- 12 that.
- 13 PRESIDING MEMBER PFANNENSTIEL: Okay,
- 14 Alex, why don't you --
- MR. CHASE: We didn't highlight the
- 16 impacts of screen settings on LCDs in this
- 17 particular presentation. Generally because it's
- less of an issue in terms of a pathway to achieve
- 19 to tier one, since a large majority of tvs already
- in the highest default settings could meet tier
- 21 one levels.
- MR. TUTT: So, Alex, before we get to
- Noah, it appears on this slide that the changes on
- 24 most power consumption from changing settings for
- 25 plasmas aren't as dramatic as the ones you showed

```
1 earlier. Is there an explanation for that?
```

- MR. CHASE: This is, again it's model-
- 3 specific. So I think a large part is these are
- 4 different plasmas than what I showed earlier.
- 5 PRESIDING MEMBER PFANNENSTIEL: Thank
- 6 you. Noah.
- 7 MR. HOROWITZ: Noah Horowitz with NRDC.
- 8 Real quick, Tim, I think you're right on. The
- 9 settings is a big deal. The IEC gives some
- 10 flexibility to the tester.
- 11 EnergyStar built from IEC, and I'll read
- 12 two parts real quickly. It says, tests in
- 13 measuring the power consumption of the model
- 14 should be tested as shipped from the factory. TV
- 15 models that do not make use of a forced menu at
- startup and are shipped in retail must be tested
- in the retail mode.
- 18 So that would give you a much higher
- 19 number than the IEC might. So, I encourage people
- 20 to look at what EnergyStar did; take a look at
- that and modify it as necessary.
- 22 They also say for products shipped with
- 23 a forced menu where the customer must select,
- 24 blah, blah, blah, the testing must be conducted in
- a standard mode, and a standard well enough

defined. These are the issues offline I think we

- 2 should all take a hard look at.
- 3 ASSOCIATE MEMBER ROSENFELD: I'm sorry,
- 4 Noah, what does standard mean to you?
- 5 MR. HOROWITZ: That's the question. So-
- 6 -
- 7 THE OPERATOR: This is the operator. If
- 8 anyone has any questions or comments, please press
- 9 star one. Star one for questions or comments.
- 10 PRESIDING MEMBER PFANNENSTIEL: Go
- 11 ahead, Noah, were you finished?
- 12 MR. HOROWITZ: So we need to dig into
- 13 this a little more deeply. Because even if Alex's
- 14 numbers are off by a little bit, the settings
- makes a huge difference.
- 16 PRESIDING MEMBER PFANNENSTIEL: Thank
- 17 you very much.
- 18 MR. TUTT: But, Noah, it sounded like in
- 19 what you read that unless there was that forced
- 20 menu at startup that you were forced to test at
- 21 the retail mode.
- 22 MR. HOROWITZ: The out-of-the-box or
- 23 retail, yes.
- MR. TUTT: Okay.
- MR. HOROWITZ: Which tend to be the

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

MR. TUTT: I had one last question for

-	
1	same.

	1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
3	Alex. You can see in your slides and where you
4	derived the tier one standard, based on the
5	EnergyStar IEC specification. How did you derive
6	the tier two standard?
7	MR. CHASE: Pull up a slide here. If
8	you look at the equations you'll notice that the
9	tier two level is actually, it's tied to the
10	EnergyStar tier one for non-high-definition
11	televisions, which becomes effective in 2008.
12	And I thought it would be nice to anchor
13	it against that at least for consistency of
14	numbers.
15	But, in general, looking at the LCDs
16	that I highlighted that were showed at the Display

But, in general, looking at the LCDs that I highlighted that were showed at the Display Week Conference in L.A., we said, okay, industry is showing efficiencies in this range. So we know that multiple panel makers would be able to achieve that based on the technology that they're showing today.

So we tried to make sure that the line fell above those. And it generally skirts above the least efficient of the advanced LCD televisions. And it obviously gives them some

```
1 room.
```

2	For the plasmas, you'll see that it's
3	wanted to pick a point where presuming the 50
4	percent power reduction claims of Panasonic, the
5	leading plasma maker, were correct, would be able
6	to meet today. Presuming, of course, that they

- 7 have four and a half years to kind of advance and
- 8 bring that to the market.
- 9 PRESIDING MEMBER PFANNENSTIEL: Thank
 10 you very much. Other questions? Okay. Thank
 11 you, Alex.
- 12 I'm sorry, a question on the phone?
- 13 THE OPERATOR: We do have a question
- 14 from the phone line.
- 15 PRESIDING MEMBER PFANNENSTIEL: Go
- 16 ahead.
- 17 THE OPERATOR: Jon Fairhurst, your line
- is open.
- 19 MR. FAIRHURST: Yeah, actually this is
- Jon Fairhurst; I'm from DR Labs of America
- 21 (phonetic) and I'm also the IEC Project Leader for
- the TV power standard.
- 23 And I just wanted to confirm that both
- 24 the IEC standard and the EnergyStar specification
- 25 are very consistent. Rather than giving

1 flexibility to the tester, which was the term that

- Noah had used, it really gives some flexibility to
- 3 the manufacturers to provide both a retail and
- 4 home setting. But it's very specific for the
- 5 tester so that you will get the same results while
- 6 testing -- flexibility to the tester.
- 7 It specifies very clearly that if
- 8 there's a forced menu to select standard mode or
- 9 home mode or the first one on the list. And
- 10 that's consistent with EnergyStar.
- So I would expect that the EnergyStar
- 12 televisions that we're going to see, and that, by
- 13 the way, goes into effect on November 1st, many of
- 14 these tvs will be using this forced menu in
- 15 startup -- by consumers to choose the more
- 16 effective settings.
- 17 And this is really based on the research
- 18 that was done that found that televisions in homes
- 19 remain in the setting as they were shipped. And
- 20 so something like over 80 percent of the
- 21 televisions at retail -- or excuse me, at repair
- centers were found to not have been adjusted.
- So, once the consumer selects home in
- startup, then there's a good chance that that
- 25 energy savings will exist pretty much for the life

```
1 of the television.
```

- 2 PRESIDING MEMBER PFANNENSTIEL: Thank
- 3 you very much.
- 4 MR. FAIRHURST: You're welcome.
- 5 PRESIDING MEMBER PFANNENSTIEL: Other
- 6 questions? All right.
- 7 THE OPERATOR: There are no more audio
- 8 questions.
- 9 PRESIDING MEMBER PFANNENSTIEL: Thank
- 10 you, Alex.
- 11 Tim Michel from PG&E.
- 12 MR. MICHEL: Good afternoon, everyone.
- 13 Thank you for having me here. As you heard, my
- 14 name is Tim Michel; I'm a Senior Program Manager
- 15 with Pacific Gas and Electric Company,
- 16 representing our customer energy efficiency mass
- 17 market group.
- 18 My specific role is I'm in charge of
- 19 electronics at PG&E. So, a major component of
- 20 what I'm going to be looking at is televisions,
- 21 along with EnergyStar 4.0 computers, monitors, and
- 22 we see a variety of other categories folding in
- 23 under this umbrella category as we move forward in
- the future.
- 25 Before I jump into the program design, I

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

want to recognize and thank a few instrumental

- 2 parties that have helped us get to where we are
- 3 today. And first and foremost that's primarily my
- 4 partners with the other major utilities in
- 5 California.
- 6 The effort that we're about to embark
- 7 upon this November is going to be an effort where
- 8 we're combining efforts between Southern
- 9 California Edison Company, San Diego Gas and
- 10 Electric Company, and just recently the Sacramento
- 11 Municipal Utility District.
- 12 So, we, as a group of major California
- 13 utilities, will be among the first in this country
- 14 to embark and initiate and launch a tv program
- with an advanced specification on televisions.
- 16 I'd also like to recognize Hewan
- 17 Tomlinson with the national EnergyStar program for
- 18 helping our group of utilities better understand
- 19 the markets that we're about to impact; help us
- with branding issues, as well as program design.
- 21 I'd like to also recognize Rebecca
- 22 Foster and Margie Lynch with the Consortium for
- 23 Energy Efficiency for their efforts in
- 24 establishing and hopefully finalizing within the
- 25 next 30 days, the advanced specification process

for televisions that will serve as a platform for

- 2 many other utilities around this country and
- 3 Canada, to adopt and implement their own programs
- 4 from.
- 5 Finally, I'd like to recognize Noah
- 6 Horowitz who we met with a few times, who's been
- 7 instrumental in helping us get a better
- 8 understanding of where we wanted to set our
- 9 program design. Get his feedback, that has been
- 10 very helpful in terms of making and fine tuning
- 11 adjustments. So, thank you, Noah.
- 12 As I said, we're looking to and
- 13 anticipate that we will launch a program this
- 14 November 1st. We anticipate the program will be
- in place through the end of 2011, or essentially
- on the IOU side of the equation, our next
- 17 regulatory cycle.
- 18 This is a program that will feature
- incentives that go to the retailer, as opposed to
- 20 a customer or manufacturer. We've chosen the
- 21 retailer as the target for our incentives because
- 22 we believe that's where the money is going to be
- best used to make a change in the energy efficient
- 24 television market.
- 25 Essentially a few other reasons why it

1 is that. The dollar incentive that we can apply

2 on a per-unit basis is so small that the impact on

the customer would be minimal. Also, it would

4 have, we would have significant issues putting

5 forward a nominal dollar fee on a per-unit basis

for the customer in terms of getting redemptions

to come back, which are our vehicle to claim

8 savings.

So we think that focusing a program at the retailer is really the right choice. And as you can see, we've targeted a number of retailers and there's more than just this list. And I can tell you I've met with all of these folks in the last 90 days.

And there's significant interest by the majority of these players on the screen, and others that you don't see, to support this type of program.

Our biggest issue up to this point is where do we set our incentive level. And just within the past couple weeks we have set the mark for the program at 15 percent above the Energy -- or better than the EnergyStar standard. I sometimes forget if you say above or below. But more efficient than the EnergyStar standard.

So, essentially when you looked at 1 Alex's lines and you saw EnergyStar had the 2 lightning bolt, ours will be a parallel lighting 3 4 bolt 15 percent more efficient than that standard. 5 Beyond just from an energy savings 6 standpoint we think that's the right way to go. Using EnergyStar as a platform provides for us 8 some significant branding efforts that can be adopted, not just at the retail side of the 10 equation, but also the manufacturing side of the 11 equation. And we think it's something --12 13 EnergyStar has significant consumer, I was going to say satisfaction, but recognition. So we think 14 15 that's an important platform for us to launch the programs with and synergize with EnergyStar at 16 17 that level. 18 I think it's also important to note that as we move forward over the course of this 19 20 program, because technology changed so swiftly 21 within this particular category, that this is 22 something that, as a group of utilities in California, we will continually be looking at. 23

So, you know, what we don't want to be

doing is offering incentives on half the tvs that

24

- 1 are sold through retail.
- 2 What we do want is we want to look at a
- 3 more finite group of those. And that's one of the
- 4 reasons why we go beyond the EnergyStar standard.
- 5 Because it represents a smaller market share of
- 6 the overall tv market.
- 7 But because of the technology changes
- 8 occur so swiftly, it's something that we will need
- 9 to look at like every three, four, six months out,
- 10 to say are we at that kind of, you know, optimal
- 11 band, you know. I think Noah would use the term
- 12 best in class, within EnergyStar.
- 13 And that means that I don't think it's a
- 14 matter of if; I just think it's a matter of when,
- over the course of the program, we make
- 16 adjustments to try to stay within that best of
- 17 class band. And I would say that's most likely
- 18 around 20 percent of the qualifying tvs, plus or
- 19 minus a few percent.
- We think, as a group of utilities, we
- 21 also think that this -- please keep in mind, this
- 22 is a voluntary program -- as a group of utilities
- we're going to be putting up major resources to
- 24 make this program successful. We want to have an
- 25 impact in this particular area, and it's one of

```
1 the prime focus for all of our collective
```

- 2 utilities that will be participating in this
- 3 program.
- 4 We think that this voluntary program
- 5 does one other important thing. And that really
- 6 helps kind of spur the innovation of the market to
- 7 synergize with the standard changes that the
- 8 Energy Commission will be thinking about
- 9 deploying.
- 10 We think, as we put forward voluntary
- programs, retailers adopt these and stock, promote
- and sell these products, that it will bring on
- more innovation in terms of energy efficiency
- 14 within the tv category. And we're excited about
- 15 what we think we can accomplish in this particular
- 16 area.
- So, California utilities, as we've
- 18 embarked on this process to engage retailers to
- 19 discuss what we want to do at the end of the year,
- we really think that we're well positioned to
- 21 collaborate not just with the national EnergyStar
- groups or the CEAs, but have stronger
- 23 collaboration with folks like the Consumer
- 24 Electronics Association.
- In fact, a couple months ago, see Bill

1 Belt with the group here, we reached out to Bill

- and his organization to discuss what we're doing.
- 3 And we hope to have ongoing dialogue and to garner
- 4 the support of their important group and their
- 5 constituency. Because I think without them we're
- 6 not going to be as successful as we otherwise
- 7 could. So it's important to involve them in this
- 8 equation.
- 9 Because this program is a retail- or
- incentive-focused program, we can't leave out
- 11 maybe the most important part of this equation,
- that we're all trying to impact. Either through
- 13 voluntary programs or through the standards that
- 14 you're going to consider for adoption. And that's
- 15 the customer.
- The customer either being the
- 17 residential or business customer that would be
- 18 purchasing these televisions, that would qualify
- in our program.
- 20 So, what we're going to be doing, as a
- 21 group of utilities, and we're going to use our
- resources to help achieve this goal, is that we
- think customer education is a prime component of
- 24 what we need to be looking at here.
- So, we want to make the customers in

these particular products from the retailers.

both segments, aware of these more efficient

televisions; promote it to the point where we're

getting them to go into the stores and ask for

We think in the absence of doing that we're not really closing the loop on the matter. Because, you know, in the end we really want the customers to make the right type of purchase; the purchase that we will provide the retailer the incentive on. So education is going to be key in this particular area.

We also think that the education goes beyond that of the customer, and that the education needs to go actually to the retailer, themselves. And promote what this program is, what it's trying to accomplish for the salespeople that would be selling these products. And we recognize that there's high turnover in many of the retailers in these particular areas. And that's why our efforts will be ongoing at the retail front through the course of the program.

As the last bullet says, you know, the incentives will be available for any television regardless of its particular category or classification within the tv category. So DLP,

```
1 rear-project or LCD, plasma, if any of those
```

- 2 technologies can get to that 15 percent mark they
- 3 will qualify -- the retailer will qualify for the
- 4 incentives that they sell through their stores.
- 5 And just to sum it up, -- I'm sorry, is
- 6 there a question? No. Okay.
- 7 We think -- we don't think, we're pretty
- 8 confident that what we're setting up here in
- 9 California is going to serve as a model for other
- 10 utilities in the country.
- On a weekly basis I get multiple calls
- 12 from utilities, not just within the United States,
- but also Canada, wanting to know what we're
- 14 setting up, why we're setting it up in the fashion
- that we're doing, so that they can either band
- 16 with, you know, come into our program, or set up a
- 17 program that will synergize along with the same
- 18 efforts that we're putting forward.
- 19 So, we're really excited about what's
- going to happen here. In fact, EnergyStar is
- 21 anticipating in September that they're going to
- 22 have a national workshop around electronics where
- we're going to be working with other major
- 24 utilities in the United States and Canada around
- 25 this area.

What is the program design; why did it 1 get set up this particular way; how do we hope to 2 impact it; what are the engineering calculations 3 4 connected up with this program? 5 How are you going to market and 6 advertise this program; how are you going to engage the education components of your program; 8 how are you working with retailers; how are you working with industry to make this thing 10 successful? We think that that is really important 11 for this particular reason, that if you think 12 13 about it, if you're a major national retailer and 14 you're selling appliances, there are hundreds and 15 hundreds of utility programs for appliances out there. 16 17 But there aren't too many synergized 18 efforts that that retailer can get, you know, stand behind and promote on a national scale. 19 20 Because we all administer the program differently. 21 There's different rules, different requirements, different rebate amounts. 22

go on around the country.

to get behind those very fragmented efforts that

23

24

25

So, it's very hard for national players

```
So we're really hoping to set up a

platform that will allow for more significant and

greater engagement for national players in the

electronics game.

So, to accomplish that our goal is to

work with groups like NRDC, the national

EnergyStar program, the Consortium for Energy
```

8 Efficiency, CEA and others so that we can really

have -- so that it isn't a fantasy kind of thing.

We want to see a harmonized, synergized program so

that we can develop the scale and commonality

necessary to really drive the results that we

think can be achieved through this particular

14 category of programs.

10

11

12

13

15

16

17

18

19

20

21

22

23

24

25

So, really, for me the bottomline is I think California is really well positioned to do a couple of important things to transform the tv marketplace.

One, through the use of utility
incentives and a voluntary program will help, you
know, essentially prime the pump for future
standards that could take hold here in California.
And we think both the customer and retailer
education components are equally important in this
process to really achieve the results that can be

```
1 accomplished through this type of effort.
```

- 2 So, I appreciate everybody's time, and
- 3 I'm happy to take any questions.
- 4 PRESIDING MEMBER PFANNENSTIEL: Thank
- 5 you, Tim. Are there questions?
- 6 ASSOCIATE MEMBER ROSENFELD: Yeah. What
- 7 sort of size of your rebate? Is it going to be 20
- 8 percent of the sales price or --
- 9 MR. MICHEL: No.
- 10 (Laughter.)
- 11 MR. MICHEL: Industry would love that.
- 12 No, the reason that we're going at the retail
- 13 level is that the dollar value is nominal. We
- 14 haven't set the amount. It will be somewhere in
- the \$10 to \$20 per-qualifying-unit range.
- And that's why we're not going to the
- 17 customer to do this, because rebate breakage
- 18 levels or the redemptions at that value would be
- in the 90-plus percent category, meaning 90
- 20 percent of the customers might do what we want
- 21 them to do, but they won't submit the rebate
- 22 application for that low of a dollar value.
- PRESIDING MEMBER PFANNENSTIEL: Tim.
- 24 MR. TUTT: Yes. You mentioned that you
- 25 have to look at this on a continual basis, and

1 also that the anticipated program dates last

- 2 through 2011.
- 3 One reason you might want to look at
- 4 this is if we, presuming we did adopt a tier one
- 5 standard effective at the beginning of 2011, that
- 6 might affect your rebate program in that year.
- 7 MR. MICHEL: Without a question, it
- 8 would. As you may have imagined, I've had several
- 9 hours of discussions with Alex Chase about this
- 10 particular issue.
- 11 And, by the way, we should thank Alex
- 12 and Ted Pope from Energy Solutions for their
- efforts here, because they've been working both
- 14 with Pat Eilert's codes and standards group, as
- well as our mass market group for the voluntary
- 16 program. And they've put in way more hours than
- you can imagine into this process.
- 18 So, for us, if California adopts a
- 19 standard that takes hold in 2011, we would have to
- look at moving our program beyond that standard.
- 21 We couldn't offer it at the same standard because
- that's what has to happen in California anyway.
- So we view the role of the voluntary
- incentives programs to push beyond whatever
- 25 standards are in place, either really here in

```
1 California, or on a national basis through the
```

- 2 EnergyStar program.
- 3 PRESIDING MEMBER PFANNENSTIEL: Thank
- 4 you very much.
- 5 MR. MICHEL: Thank you.
- 6 PRESIDING MEMBER PFANNENSTIEL: Noah.
- 7 MR. HOROWITZ: I'm going to sit down
- 8 here if that's okay. Is this on?
- 9 PRESIDING MEMBER PFANNENSTIEL: If the
- 10 green light -- should be a green light
- 11 illuminated.
- MR. HOROWITZ: Okay, there we go.
- 13 Good afternoon; I'm Noah Horowitz and
- 14 I'm a Senior Scientist with NRDC, the Natural
- 15 Resources Defense Council. I want to acknowledge
- all the hard and excellent work by PG&E and their
- 17 consultant, Energy Solutions; and for the
- 18 opportunity to address everybody today, both from
- 19 the Commission and many of the manufacturers and
- other stakeholders in the room.
- 21 We've been looking at tvs at NRDC
- 22 probably as long as anyone has. I travel a lot
- and I kept seeing these flat screen tvs appearing
- 24 in airports and hotels. And how much power do
- 25 these use? It's a better tv; it's a bigger tv.

1 And some of our initial data helped result where

2 we are today.

I'm pleased to say the world is

changing. We took our first report to the

consumer electronics show. I walked around to

every booth with a two-page summary and said, can

you tell me how much power your tv uses. Nobody

could tell me. A few of them looked at the back

of the tv and said, oh, it's 400 watts or

something. That was the UL rating of how much

power can this tv use without exploding.

12 (Laughter.)

11

20

21

22

13 MR. HOROWITZ: Now, where we are today
14 is Philips proudly announced they were the winner
15 of a competition; they had the most efficient tv
16 at the show. And we're seeing all these major
17 panel producers and tv makers touting their tv as
18 more efficient than the next. And we're seeing
19 savings, 10, 20, 50 percent and beyond.

So I think now we're ready to start to begin to talk about standards, the industry is catching up.

23 Mainly I'm here to support the proposal 24 that's been put forward by PG&E that does it in a 25 two-step process. The only difference we have,

1 and we think it's a respectful one, is to consider

- 2 moving up the timelines. And I'll share some
- 3 alternates.
- 4 I'm going to focus on the big picture,
- 5 and I'm going to give a couple of different
- 6 options. And whenever I say picture it's not
- 7 meant as a pun, but we can't help ourselves here.
- 8 Perspective-wise, the savings that Alex
- 9 showed, once we have a full turnover of the fleet
- 10 of tvs, we're looking at 600 megawatts. That's a
- 11 decent sized power plant the way we look at
- 12 things.
- 13 And I'm also very active, as many of you
- are, in the building code, the energy code, which
- is Title 24 in California. We worked awfully
- hard, as they did a great job at the CEC and the
- 17 builders. We're looking at first-year savings of
- 18 120 megawatts from the building code simply by
- 19 adopting a sufficiently stringent standard for
- 20 tvs. Look at the equivalent of five years of
- savings that we get from the building code.
- 22 So this is a really big deal, and I
- encourage everybody to be open minded and let's
- 24 make sure we get this right.
- So, let me go to my formal comments

1 here. And, Melinda, if you can keep track with

- 2 me. Next slide, please. One after that.
- 3 Okay, tvs from a really high level, it's
- 4 one of the biggest remaining unregulated
- 5 electricity uses in the home. As Commissioner
- 6 Rosenfeld aptly pointed out, if you have a 200,
- 7 300 watt tv that's on five-plus hours a day, and
- 8 the Nielsen data comes in at about seven hours per
- 9 day, believe it or not, for the main tv in the
- 10 home, you're easily exceeding today's new
- 11 refrigerators that peg in at around 450 kWh per
- 12 year.
- And why is tv energy use growing? The
- screens are getting bigger every year. The 30
- inch was the sweet spot, now 42, 47 inches are the
- sweet spot. And it continues to grow.
- 17 They're on more hours per day. You have
- 18 roughly 100 stations available for you if you have
- 19 a pay tv. People are watching movies in the form
- of DVDs or downloaded movies. They're playing
- video games. So the hours people are in front of
- 22 tv is growing. We won't talk societally whether
- that's a good thing. That's not our job today.
- 24 There's also the move to high definition
- 25 tv which results in slightly greater energy use,

- 1 as well.
- 2 As we've heard, EnergyStar has set their
- 3 first spec. Their approach, which often makes
- 4 sense, is they walk before they run. Their spec
- 5 had a glaring hole in that it didn't include on-
- 6 mode until this most recent version. And they
- 7 intend to ratchet it up considerably in a tier two
- 8 that would go into effect in 2010. So let's keep
- 9 track of that.
- 10 We're looking at EnergyStar today, but
- 11 the EnergyStar of the future will likely be much
- more stringent.
- 13 Very big picture, why do we care about
- 14 tvs at NRDC. It's roughly 1 percent of national
- 15 electricity use, just for this one widget.
- 16 There's been a whole lot of interest and
- 17 study on datacenters. If you add up all the
- 18 servers that are the backbones, the Googles and
- 19 the internet and your email and your office
- 20 intranets, that's a little more than 1 percent, as
- 21 well. So tvs are a really big deal and we need to
- get our arms around it.
- When are we ready for a standard? I
- think we would all agree there are four key
- 25 elements. We need a reliable test method. We

didn't have that till earlier in the year, so it

would be premature to have this discussion. I put

- 3 a checkmark there.
- We didn't have data for a new test
- 5 method due to the EnergyStar process and other
- 6 things. We have a wide amount of data, both from
- 7 the U.S., Europe and other sources. Even the
- 8 CNETs of the world are starting to measure tv
- 9 energy use.
- 10 We also need to see a spread between the
- 11 best- and worst-performing models. And what we're
- 12 here advocating today is we should be setting
- 13 floors that will increase to remove the least
- 14 efficient models from the market.
- 15 You need evidence that you can meet
- 16 that, either with models that are on the market
- 17 today, or will be introduced relatively soon. And
- 18 Alex blew me away with manufacturer after
- 19 manufacturer's plans to bring models that are 25,
- 20 50 percent more energy savings. And that's just
- 21 today, many years before these standards would go
- 22 into effect.
- 23 ASSOCIATE MEMBER ROSENFELD: In fact,
- 24 many years before we even discuss labels where the
- consumer knows that the tv draws power.

1 MR. HOROWITZ: Exactly. I'll be talking

2 about labeling in a minute, so, thank you.

so, we're talking about on or active mode, depending what term you prefer. This is an old slide I pulled up. So, yes, it's true the tv is probably off or in standby mode the majority of the time, call it 18, 20 hours or so a day. And it's only drawing a couple of watts, and good for everybody for agreeing to that standby standard.

But during those five hours a day it's drawing so much more power than cumulatively this is 85, 90 percent of the annual energy use. And we're not addressing that yet, and we need to, as a state.

Next slide, please. So, real quick, on test methods. There is a DOE test method on the books. It's 30 years old. It uses static black-and-white test patterns that don't sufficiently stress today's digital tvs.

The industry, to their credit, recognized the shortfall with a little prodding. And they worked through the international standard setting body, IEC. And Jon Fairhurst from Sharp, who's on the phone, did an amazing job and in record speed. We now have a test method that the

1 whole industry has embraced. And it uses a

- standardized set of clips to replicate the average
- 3 brightness levels of tv images.
- 4 That doesn't have the IEC pedigree.
- 5 It's a big international institution. It's passed
- 6 the technical committee, and we understand it's
- just a question of several weeks, you know, well
- 8 into the fall or so we should have the final
- 9 version. That may slip a few weeks based on some
- of the bureaucracy there. But, consider that
- done.
- 12 EnergyStar has relied on this IEC test
- 13 method. The Europeans are relying on it. The
- 14 Australians, and the Chinese might, as well. So
- 15 we have an international industry consensus test
- method, and that's essential.
- 17 Then we have a whole bunch of data and
- an increasingly growing dataset based on that test
- 19 method.
- The EnergyStar dataset, a couple of
- 21 things I want to point out is most of the test
- 22 data there was using the settings that were
- 23 retail. So, it's the higher end, and these tvs
- are capable of drawing a whole lot less power. So
- 25 that's kind of a worst case dataset. And it

1 doesn't reflect any of the models that Alex has

- been talking about.
- 3 It's part of a longer conversation, but
- 4 CEA did a great job polling their members and
- 5 submitting the data to EnergyStar for the IEC test
- 6 method. But for reasons unbeknownst to me they
- 7 refused to include the make and model number. So
- 8 we have a hard time distinguishing our basecase to
- 9 where we're moving if this is a representative
- 10 dataset. So, we'll talk, in a minute, about CEA's
- offer to provide data which we think is a great
- 12 idea.
- 13 Let's talk about the data spread. There
- is a wide spread within the plasma-versus-plasma,
- 15 within LCDs and between the different families of
- 16 technology.
- Go to the next slide. Yellow is what
- 18 you and I would call an LCD. Green is the plasma.
- 19 And interestingly enough we haven't spoken bout,
- 20 but we shouldn't lose sight of, DLPs -- what's the
- 21 acronym DLP -- digital light processing. Yes.
- 22 And some rear-projections.
- The red is that stairstep line that
- 24 EnergyStar has. And here's the plotted data. And
- it's interesting to note, 42 inches, which is a

```
very common dataset, we've got a plasma that's
```

- 2 doing better than some LCDs. This is why we need
- 3 technology-neutral, performance-based standards.
- 4 Let all these different technologies fight it out
- 5 to win the battle here.
- 6 Also, there's been a lot of emphasis on,
- 7 hey, you're going to kill the plasma industry.
- 8 Well, we heard from Alex that simply by changing
- 9 the settings they could dramatically reduce their
- 10 energy use. And sometimes they're the clear
- 11 winner.
- 12 Plasmas are roughly 10-plus percent of
- 13 the market. Those really low levels that people
- 14 haven't focused upon, those represent almost a
- 15 similar sized marketshare. To be fair, though,
- those are fatter models that you can't hang up on
- 17 the wall. So it's not apples-and-apples.
- 18 ASSOCIATE MEMBER ROSENFELD: To show my
- 19 confusion on the plasmas, are the plasmas on your
- 20 plot there at the higher brightness level?
- 21 MR. HOROWITZ: Yes. That was the data
- that was submitted to EnergyStar.
- 23 ASSOCIATE MEMBER ROSENFELD: The old
- 24 EnergyStar.
- MR. HOROWITZ: Those are the datapoints

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

1 that EnergyStar chose to use. So I think again we

- 2 need to circle back after this meeting of what
- 3 settings are being used and how to base policy
- 4 around that.
- 5 So, for a market background point of
- 6 view, there's a term of art called the panel
- 7 maker. So imagine the glass that you see in
- 8 front, so that's the screen. The backlight units
- 9 are defusers. That whole package, if you will, is
- 10 the panel. That's the guts of the tv.
- 11 And there are five major panel makers,
- most of them based in Asia, that are making the
- vast majority of LCDs. All five of them are
- 14 developing energy efficient or eco-tvs. They have
- their own name. And Alex did an amazing job
- 16 talking about them.
- 17 My understanding is they're not
- 18 represented in this proceeding, and I think we
- 19 should reach out to them. The tv makers, the
- 20 Panasonics and Philips and the Sonys, buy panels
- 21 and then add tuners and the chassis -- or, I'm
- 22 sorry, the enclosure and the speakers and things
- 23 like that. And have their name on it.
- 24 But it's the AUOs and the CMOs that Alex
- 25 mentioned, those companies, they're the ones that

1 are driving this innovation in part. And if

- 2 there's an incremental cost. We need to hear
- 3 directly from them, as they seem to be pushing
- 4 this pretty hard.
- 5 As has been shown earlier, Alex had some
- 6 amazing stuff, so I'm embarrassed by my text-based
- 7 PowerPoint here, but we're seeing energy and power
- 8 savings of roughly 30 to 50 percent without any
- 9 attribution to reduce the picture quality.
- There's a big potential to optimize
- 11 these models. And we're trying to get more direct
- 12 cost information because we fully understand
- incremental cost is part of this discussion. But
- 14 if you can optimize by using a film or some other
- 15 technique that allows the light to transmit more
- 16 efficiently, you could eliminate some lamps. That
- 17 saves some cost.
- 18 For each lamp you have an inverter
- 19 eliminating the need for some of those inverters.
- 20 Your overall power budget goes down so you can buy
- a smaller power supply, which means you bought a
- less expensive power supply.
- So, I think, at the end of the day,
- these incremental costs will be near zero costs.
- 25 If not today, in the near future, for these LCDs.

Next slide. There's a well-kept secret
that's not so secret anymore is manufacturers ship
their tvs overly bright, for two reasons. They
don't want to have to rely on the technician on
the floor at WalMart or BestBuy when they open the
box. That's the one people look at in the store.

1.3

The stores are overly lit in many cases, so they need the tv to be brighter. And all other things being equal, people buy the brightest tv that's available. So these things are over-tuned-up, Alex used the term of art, torch mode.

So all tvs are shipped historically in that mode, even though we're talking about, you know, a couple of thousand sites retail where these are sold. And we're all being penalized for that. The millions of people at home, some of them may be keeping their tv at that over-bright setting. We need to fix that, and I think we've just started to discuss how to do that. And Panasonic has led the way on the plasma side. We think we should take a hard look at that.

Next slide, please. Alex pointed out the double efficiency that Panasonic and their joint venture, Pioneer, are pursuing. Those are clearly the one and two in the plasma industry.

```
And it's their words, not mine, that they said in
```

- the consumer electronics show over half a year
- 3 ago, that these new innovations would cut annual
- 4 power consumption approximately in half. So, this
- 5 isn't fiction, this is real.
- And, again, we should be thoughtful
- 7 about plasma, but not over react to that because
- 8 it's currently a relatively small part of the
- 9 market.
- 10 I'm going to quickly go over various
- 11 policy options that I think many of us are
- 12 considering, starting with no standard at all,
- just testing and list, all the way down to a two-
- 14 tier standard like PG&E has proposed.
- 15 Let's take a look at test and list. The
- 16 CEA, in their letter to the Energy Commission,
- said let's do test and list and let's begin
- 18 2/19/09, which is when the nation is shifting from
- 19 analog broadcast to digital only.
- 20 From our point of view why wait. We
- 21 think there's going to be a media blitz before
- 22 then, particularly around the holiday season. Get
- 23 ahead of this digital transition, buy this new
- 24 flat panel tv. Let's get that information in the
- 25 hands of consumers or more available. Let's not

- 1 wait till 2/19 is our point of view.
- 2 Also, there's this massive EnergyStar
- database of models provided by CEA members. It's
- 4 puzzling to us why we can't have the model number
- 5 and the manufacturer name. That would be a great
- 6 first start and a good faith effort by the
- 7 industry well before 2/19. There's nothing
- 8 confidential in our mind of the energy use of a
- 9 tv. We're not asking for sales data or price. We
- 10 understand the sensitivity of those.
- 11 Also, if we just stop to test and list,
- 12 we're going to get that from the Federal Trade
- 13 Commission anyhow, as one of the requirements of
- the federal energy bill called EISA. Tvs are
- 15 going to be required to have a label just like the
- 16 yellow energy guide that's on a lot of other
- 17 goods.
- 18 Most importantly, while test and list is
- 19 a valuable thing, and we do need to let consumers
- 20 know how much energy a tv uses so they can build
- 21 that into their choice if they'd like to, but we
- 22 need to remove the least efficient models from the
- 23 market. We need to set a floor, and that's what
- 24 standards do. And that's where the CEA proposal
- falls short, in our opinion.

```
So, some people may say why don't you
 1
         just wait a little while and then adopt
 2
         EnergyStar. Is that good enough? Well, as Alex
 3
 4
         pointed out, we're going to see very high
 5
         compliance rates, probably 50 plus percent, simply
 6
         by changing the settings. So we're well on our
         way to EnergyStar.
 8
                   And those stairsteps that you saw in the
         EnergyStar, that was a concession due to a lot of
10
         industry pressure. And that worked for
         EnergyStar. But the reality is we're adding 50 or
11
         so watts to what the data typically follows a
12
13
         straight line. Why are we doing that?
14
                   And also those really big tvs, those are
15
         the biggest energy consumers. If anything, that
         line should be flattening, not increasing. And
16
         many of these tvs are on 12 hours a day if it's in
17
18
         the hotel lobby or a bar or something like that,
         where the really large ones tend to wind up.
19
20
                   Next slide. So we agree, as a good
21
         first step is to take the up to 40 inches, the
```

25 In terms of an effective date, based on

lot of sense.

part of the EnergyStar line that is straight, and

just continue with that. We think that makes a

22

23

1 the anecdotal information Alex has provided, and a

- lot of the web-based support for that, and the
- 3 information on the settings, PG&E has proposed an
- 4 effective date for tier one of 1/1/2011. That's
- 5 three and a half years from now.
- 6 Given the challenges California's facing
- 7 in terms of meeting its energy and carbon goals,
- 8 we don't think we need to wait that long. And we
- 9 respectfully submit an earlier date of November 1,
- 10 2009. And we picked that because there's a big
- spike in tv sales just before the holidays. Let's
- 12 catch that holiday season.
- 13 Next we talked about the tier two, which
- 14 we recognize is more ambitious than the EnergyStar
- 15 levels we've been talking about. Given all the
- information received today, many years before a
- 17 standard would go into effect, we think we should
- 18 set a firm line, and set a clear target for the
- 19 industry, and help solidify these investments.
- 20 Also, PG&E and the other statewide
- 21 utilities, and hopefully other leading utilities
- in North America and elsewhere will offer rebates
- 23 at this tier two level to help jump-start this
- 24 market, and bring those models to the market
- 25 earlier, and smooth out this transition.

There's some other benefits here. don't have enough time to talk about them, but more efficient tvs, and I think it was on the Panasonic slide, they're thinner tvs. So what does that mean? You're going to have less packaging materials; you're going to be able to get more on the container coming from Asia; and there will be reduced shipping costs from the manufacturer. So there's some other incremental

and environmental benefits here.

Next slide, please. So, to wrap up, being respectful of time here, what if we were to be really creative here. Why don't we adopt both the PG&E and the environmental proposal and CEA's proposal. We say let's do that. Let's do the test and list, and let's adopt the two-tier standard that PG&E's proposing.

I think Tim previewed a very important issue. Getting the settings right is critical. Let's take a harder look at what IEC did, what EnergyStar recommends, and if necessary, we'll have some language, use the IEC test method with an addition, here's what you should do on the settings.

We think Panasonic showed greater

1 leadership here, the way they set it up, and
2 that's a model to look at.

Why am I so concerned and encourage

other people? We heard that tvs often stay as

they're shipped. Many tvs today are shipped in

this retail mode. We don't want the tvs to stay

there.

1.3

Also, we want to make sure these savings are real, not just paper savings. Yes, the tv could use this much power, but it also could use this much power. Where is it going to stay a month after it's in the consumer's home.

So, in conclusion, we recommend the two tier standard with the dates that we've shown, 11/1/2009 for tier one, which is a full year after the EnergyStar spec has been in effect. And tier two would be two years later, roughly three years from today, which we think gives plenty of time for these various manufacturing improvements to take hold at the factories.

So, we want a technology-neutral, performance-based standard. We think it would be a big mistake to set a different spec for plasmas, a different spec for LCDs, a different spec for DLPs and so forth.

We think it's crucial to include a tier
two spec now. If we just stop at tier one, we're
leaving on the table a lot of the savings, and
will delay setting that standard in the future.

Again, for the PG&E's consultant's

1.3

numbers we're looking at 600 megawatts of demand savings. And I was looking at the paper yesterday and on the front page of the San Francisco

Chronicle was a big article: Look how great our

PV program has done; we've saved 60 megawatts in terms of putting new PVs on people's homes. We're going to deliver ten times that with a standard.

And that program, which is a good one, don't get me wrong, we're investing hundreds of millions and millions of dollars in that. So, here's our way to get close to a free power plant for California.

Last slide. Changes will be needed to meet the tier two, and for some manufacturers tier one. We recognize that and we look forward to a real dialogue with the industry to figure out these dates.

We think roughly three and a half years from today is sufficient to attain those. We're willing to talk to industry about this and the

```
1 levels.
```

19

20

21

22

23

24

25

And I want to make crystal clear and leave with people, we've heard all sorts of horror 3 4 stories. If you set a standard there won't be tvs 5 available, or this type of tv won't be available. 6 Whether you want an LCD, a plasma, rearprojection, after tier two goes into effect, 8 there's clear indications there'll be wide choices for everybody. 10 Thank you. PRESIDING MEMBER PFANNENSTIEL: Thank 11 you, Noah. Questions? Art. 12 ASSOCIATE MEMBER ROSENFELD: Yeah. 1.3 14 Noah, has there been any discussion with you or 15 within the industry, I'm harking back to this point that the average consumer, I guess, knows 16 17 that you can dim an incandescent light. And 18 there's some reason, partly money.

Any way of conveying the wattage in the on-mode, in the active mode, as a little decal thing at one corner of the screen saying, this unit is now using 500 watts, or 400 watts? Any discussion of that?

MR. HOROWITZ: I would pose that to the

industry, if that's something they will be willing

1 t	0	entertain.	Ι	think	it's	а	great	idea	, arming

- 2 people with information. Some sort of slider
- 3 scale, if I move the brightness or contrast this
- 4 way, how does my carbon footprint or my operating
- 5 costs or power change. There are lots of creative
- 6 ways to do this.
- 7 One thing we did talk about, which is
- 8 another technological innovation, is sometimes
- 9 you're watching a movie in your house at night.
- 10 The room is darker, so you're seeking a certain
- 11 contrast ratio. The tvs have sensors and will dim
- the picture accordingly and use less power. That
- capability is in many new tvs.
- 14 ASSOCIATE MEMBER ROSENFELD: Well,
- that's very interesting. Thank you.
- 16 PRESIDING MEMBER PFANNENSTIEL:
- 17 Excellent. Other questions?
- 18 MR. TUTT: Just one question, Noah. You
- 19 mentioned a couple of times that you think we
- 20 should set standards as floors to remove the least
- 21 efficient models from the market.
- I don't know that we have a complete set
- of data, but it doesn't -- what do you mean by
- 24 least efficient? Are you talking 20 percent, 25
- 25 percent of the models? Does it differ by

```
1 technology?
```

- MR. HOROWITZ: As high as we can go with
- 3 cost effectiveness and availability of product.
- 4 PRESIDING MEMBER PFANNENSTIEL: Thanks,
- 5 Noah.
- 6 MR. HOROWITZ: Thank you.
- 7 PRESIDING MEMBER PFANNENSTIEL: Now
- 8 let's hear from Consumer Electronics Association.
- 9 Who's going to do that?
- 10 Hi, Doug. I think we have given you
- 11 some -- the prior presenters have given you some
- good information, and now we'd like to hear how
- 13 you'd like to approach it.
- 14 MR. JOHNSON: Thank you. For the record
- my name is Doug Johnson; I'm Senior Director of
- 16 Technology Policy for the Consumer Electronics
- 17 Association.
- 18 And as you acknowledge, Commissioner,
- we've been set up quite well with some material in
- 20 a couple of presentations.
- 21 First, though, I'd like to reference one
- of the opening comments made by Mr. Fernstrom of
- 23 PG&E, characterizing PG&E's proposal as a modest
- 24 proposal, like the Jonathan Swift essay in the
- 25 1700s. This is anything but a modest proposal,

Gary. And we'll get into the details of this 1 2 shortly.

4

5

6

8

13

14

15

16

17

18

19

20

21

22

23

Next, in acknowledgement to Mr. Chase 3 with Energy Solutions, I'd like to thank him for showcasing in a very good way with a lot of pictures and stories, the fact that industry is already introducing and promoting energy efficient tvs. So as the Commission tries to understand what is going on with televisions, the transition 10 to digital television and energy use, a lot of this explains that the market is transforming even 11 as we speak here this afternoon, and delivering 12 more efficient products one after the other.

> So, it is a very good-news story, and it's all the more reason why detrimental approaches, as the one that's being suggested by PG&E, are unnecessary.

Then one reference to the zero dollar cost figure. I've been engaged in discussions with the Commission. As you know, we've worked closely with you to remedy the problems encountered with the regulation for external power supplies.

And I remember, during those 24

discussions, the Commission's consultants said the 25

1 solutions are practically free. And subsequently

- we heard from a number of industries; they were
- 3 here to explain there are no free solutions.
- 4 There were costs that were certainly not
- 5 considered during the regulatory process leading
- 6 up to the initial external power supply
- 7 regulations.
- 8 So the zero dollar cost, you know,
- 9 moniker, is really nonsense. There are real and
- 10 significant dollar investments behind materials
- and design innovations. And I encourage Mr. Chase
- 12 to take a careful look at his own presentation,
- 13 slide number 51, and understand what's behind some
- of those statements and innovations.
- 15 As I open here I'd just like to give a
- 16 quick background of CEA. Many of you know, some
- of you may not, we're a high tech trade
- 18 association representing about 2200 companies
- 19 across the spectrum of the industry really. All
- the brands and products you see in your local
- 21 electronics retailer, including the retailers of
- those products.
- The industry is about \$161 billion. Our
- 24 membership is diverse, as I mentioned. It
- 25 includes a lot of small- and medium-sized

1 businesses, as well, in addition to the large

- brands you've heard about today.
- A note for the record, as well. You see
- 4 a number of empty seats in the room today. And we
- 5 do want to note that industry takes this
- 6 proceeding very seriously, however we know that
- 7 the Commission was quite interested in holding
- 8 this on July 16th, as we learned about a few days
- 9 ago.
- 10 There are a number of conflicts for
- industry this particular week. The Commission
- 12 Staff knows that. So I'd just note for the record
- 13 that we have a small delegation here, but a great
- interest in what's transpiring.
- 15 PRESIDING MEMBER PFANNENSTIEL: Thank
- 16 you, Mr. Johnson. And I would say that it is
- 17 likely that we will hold another workshop on the
- 18 subject. I think we wanted to kick it off and get
- it started, but we understand that there's a lot
- 20 of information here, and we should be scheduling
- 21 our next one shortly.
- MR. JOHNSON: Oh, thank you,
- 23 Commissioner. Let's work collaboratively and find
- 24 a date that really works for industry.
- 25 PRESIDING MEMBER PFANNENSTIEL: Yes

MR. JOHNSON: Our contributions are

diverse and quite involved. And I just wanted to

review how we're approaching energy efficiency in

general. We're going to talk about the proposal

with regard to tvs and what we're doing, specific

to tv energy efficiency.

But in general, we're out there in a very comprehensive way, trying to do the right thing by reducing power consumption, improving efficiency, delivering to consumers the products that they desire.

We are, as you know, very supportive of market-oriented approaches such as EnergyStar.

And we'll talk about the merits of what they've recently done for televisions in a moment. And obviously we'll get into the details. My colleague, Bill, will step up shortly to talk about the details of our proposal that we've put on the record.

I would like to explain in a little bit more detail our comprehensive approach to energy efficiency. On the policy side, as you know, we are strong supporters and advocates here and abroad of voluntary market-oriented programs such as EnergyStar.

On the research and analysis side we've made contributions to fill gaps that have existed.

3 From our initial engagement with you, it was very

4 clear that you did not have good data to work

5 with, you and other policymakers in this country

6 and around the world.

11

12

1.3

14

15

16

17

18

19

20

21

22

23

24

25

7 So we've completed two major studies.

The first one did address primary energy use of consumer electronics products. And it was a study

10 completed and disseminated last year.

More recently we have done a study to help policymakers and consumers understand the energy savings and emissions-reducing benefits of using technology products for telecommuting and ecommerce. So, not only do we want to look at prime energy use, we want to look at ways in which energy is saved and emissions are reduced by the use of these products, including televisions and home theater environments.

On the standards side you've heard from

Jon Fairhurst in particular about the industry-led

effort to develop a new standard for measuring tv

power consumption. This is almost complete,

actually; in essence it's complete, but near

official. And that was a result of a broad effort

at the international level involving a number of industry and nonindustry stakeholders.

1.3

Industry also delivered a new specification for measuring set-top box power consumption. Set-tops are another important category with regard to energy consumption.

On the consumer education side, it's very important, as the gentleman from PG&E noted earlier with regard to reaching out to consumers, we launched a website last year based on that energy use study we did to at least give consumers today an understanding of the categorical level how much power is being used by products in the home. And understand terms of watts and dollars, how much it costs to power these things.

Yes, our ultimate goal is to get down to the model level with a figure that we can present to the consumer. And we work closely with policymakers on Capitol Hill to develop that language that was in EISA 2007 last year.

We have used our trade show, the largest gathering of the industry in the world, to promote energy efficient products. Design, we've rewarded products, as you heard referenced earlier. We promote energy efficiency and environmental issues

```
in general at this trade show. There's a lot
```

- 2 going on and the trade show tries to bring that
- 3 together in a way that's, you know, understandable
- 4 to media analysts and others who are
- 5 participating.
- 6 Outreach and coordination efforts have
- 7 included obviously outreach to policymakers, NGOs,
- 8 researchers, as well as utilities.
- 9 So the EnergyStar program for
- 10 televisions, itself, was a broad-based,
- 11 collaborative, two-year effort that has resulted
- in a first-ever specification for televisions that
- includes active mode in addition to standby power.
- 14 It's quite an accomplishment. And it was the
- 15 result of input by a number of many factors, as
- 16 well as NGOs such as NRDC.
- 17 We have regulators at the table and
- analysts and others. And it was a great outcome.
- One of the merits of this, of course, are that tvs
- 20 will be tested in factory default settings, and
- 21 this will have the impact of encouraging shipment
- of tvs in lower energy-consuming modes. And so
- this is a great outcome, a result of this new
- 24 specification.
- 25 As you heard earlier it's effective this

fall. Importantly, a compliant product will be

- 2 available for the upcoming high-demand sales
- 3 periods that you heard Mr. Horowitz reference
- 4 earlier.
- 5 We have the holiday selling season; we
- 6 have the superbowl; we have the transition to
- digital television broadcasting in February.
- 8 EnergyStar is ready for those selling periods.
- 9 The tier two effective date, or a tier
- 10 two effective date has been built into this
- 11 specification. The new specification for tier
- 12 two, that is a number to be attached to that
- 13 effective date, will again be vetted through this
- 14 broad stakeholder forum.
- 15 So, EnergyStar has an existing forum in
- 16 which the Commission Staff has participated, along
- 17 with all these other stakeholders. So that is the
- 18 appropriate venue for bringing parties together to
- 19 take a look at what's happening with the market
- 20 for tv energies and addressing it in a way that's
- 21 not detrimental for the market.
- The merits of EnergyStar are several.
- 23 They certainly include it's voluntary market-
- 24 driven and increasingly international acceptance.
- 25 It is a partnership, a public/private partnership

```
which is really important as we address not only
```

- 2 energy, but environmental issues in general.
- 3 It captures tvs, along with a wide range
- 4 of other products, as the Commission knows. There
- is strong participation by manufacturers. It's
- 6 well recognized by consumers, more than 70
- 7 percent, I understand from EPA.
- 8 It offers a competitive incentive. In
- 9 other words, it's transforming this market in a
- 10 way that's competitive. This industry is
- inherently very competitive. The EnergyStar
- program provides one more qualification on which
- 13 to compete.
- 14 And as I mentioned, importantly it's
- 15 transitioned now to address a more holistic view
- of energy consumption, active and standby power
- mode together.
- 18 Beyond tvs, EnergyStar has tackled set-
- 19 top boxes with a new specification, revised
- 20 specification power supplies. We'll be looking at
- 21 computers, monitors, and imaging equipment for
- revised specifications in the near future. So,
- it's a growing program and it's more active than
- ever.
- 25 It is a success story. And to the

1 state's goal, to California's goal of reducing

- 2 carbon emissions, the EnergyStar program offers a
- 3 comprehensive solution. And within the EnergyStar
- 4 program, as this slide illustrates, electronics
- 5 are an EnergyStar success story.
- 6 Electronics offer the greatest amount of
- 7 savings, whether measured in kilowatt hours, or
- 8 emissions reductions, as indicated here in this
- 9 chart.
- 10 So this program called EnergyStar has,
- over time, proven to be the best and most
- 12 effective approach for reducing emissions, saving
- energy. And it's doing this, and I emphasize,
- 14 without harming innovation, without sacrificing
- 15 consumer choice, and without impeding product
- 16 convergence in a way that artificial limits and
- 17 regulations would.
- Now I'd like to address in the next
- 19 couple of slides the specifics and some concerns
- 20 about PG&E's revised proposal. In its opening, in
- 21 its introduction to its proposal PG&E states that
- 22 its report is a comprehensive technical, economic,
- 23 market and infrastructure presentation of
- 24 comprehensive information on technical issues,
- 25 economics and market issues.

It, in fact, is not. It's missing a
large amount of information which is very relevant
to making a decision about this proposal.

Particularly with regard to data there's deficiency. This data that's presented in the PG&E proposal is neither a fair nor an accurate representation of what is on the market now, let alone what will be in the market in the near or medium term.

As PG&E, itself, admits, all of its datasets are different. There are many relevant variables behind this dataset, including display technology, test procedures, test conditions, display resolution, date of manufacture and so forth.

PG&E fairly characterizes the data sources it has cited, but the fact of the matter is there are inconsistencies. And as PG&E again admits, tv models may be represented more than once in this dataset. So you could have duplication or triplication of information.

Nobody knows. As they say, it's impossible to distinguish how many unique models there are in this dataset.

Further, PG&E acknowledges that there is

```
1 no accounting in their proposal or in their
```

- 2 analysis for natural market improvements. And
- 3 that would be improvements in existing technology
- 4 as well as the introduction of new technology. We
- 5 know for a fact that this goes on in our industry
- 6 constantly. It is part of the energy efficiency
- 7 story.
- 8 Innovation is a driver for energy
- 9 efficiency. EnergyStar program complements that.
- 10 Both are working. Both are working now. But,
- again, the proposal and the analysis offered by
- 12 PG&E does not account for the dynamic of those
- 13 approaches.
- The proposal obviously mandates an
- 15 arbitrary power limit for televisions in active
- 16 mode. In its effect it would ban noncompliant
- 17 products at the expense of innovation,
- 18 convergence, consumer choice and consumer
- 19 preference.
- 20 We noted in the revised proposal that
- 21 the specification line indicating the EnergyStar
- 22 program was removed from the graphs. I think they
- 23 meant to include it. I noted that they included
- it in their presentation materials today.
- 25 But the point is, with regard to

```
1 EnergyStar in comparison to PG&E's proposal, that
```

- 2 the PG&E proposal would undermine the very
- 3 successful and recently developed EnergyStar
- 4 specification for televisions with further impacts
- 5 and implications on the EnergyStar program, in
- 6 general.
- 7 Again, EnergyStar resulted from a broad
- 8 collaborative stakeholder effort. The PG&E
- 9 proposal comes from PG&E and its consultants.
- 10 I'd like to briefly go over some
- 11 considerations and issues here and emphasize for
- the Commission that there are a number of serious
- issues that are not addressed in this mandatory
- approach that need to be examined thoroughly.
- 15 PG&E's proposal, based on our initial
- analysis, would include 50 to 65 percent of
- 17 televisions available to consumers today. It
- 18 would impact all sizes of televisions. But
- there's a particularly large impact on two classes
- 20 of tvs, inexpensive flat panel tvs over 40 inches,
- as well as feature-rich sets over 40 inches.
- 22 Each of these impacts and all impacts
- pose particular problems for the consumer market.
- 24 And I'd like to get into some of those issues in
- 25 particular.

PG&E's proposal does not give thorough
analysis or consideration to major issues such as
how this would affect consumers, at home, in the
store, et cetera. PG&E's proposal does not
address potential adverse impacts on retailers,
independent dealers, distributors or custom
installers whose businesses and livelihood rely on
these latest innovations.

1.3

There's no analysis of adverse impact on commerce, whether that be interstate trade or overseas trade. There's no analysis of adverse impact on innovation.

There's also no analysis on tax revenue loss impacts that could affect the state. Taking a few figures here in this slide, we estimate that the impact could be very significant, in the hundreds of millions of dollars annually over the next ten years.

If you take the figure of 1.2 million tvs sold in California annually that are over 40 inches, and an average selling price of \$1500 for those models over 40 inches, and you apply the sales tax rate of about 7.5 percent, you end up with a figure of \$135 million. And this does not include lost sales tax revenue resulting from lost

1 opportunities to sell accessories for those

- 2 impacted televisions.
- 3 This slide is meant to be illustrative,
- 4 but this is not what we want to see in the
- 5 marketplace. This is characterized as the impact
- of the PG&E proposal. It's a view of the store
- 7 shelf, if you will, under this rather Draconian
- 8 way to address energy efficiency.
- 9 It's not the outcome that's appropriate.
- 10 There are better ways. I think all of us in this
- 11 room, I hope all of us in this room agree that the
- goal is energy efficiency. There are different
- 13 paths to get there. For the tech sector we must
- look at what is the most appropriate path for
- 15 transforming the market and getting us to that
- 16 goal.
- 17 At this point in the presentation I
- 18 would like to turn the microphone over to my
- 19 colleague, Bill Belt, who will review in some
- 20 detail the proposal that we have put on the record
- 21 earlier this month. Bill.
- 22 PRESIDING MEMBER PFANNENSTIEL: Thanks.
- 23 Before you do that, let me ask a question. I'm
- 24 not sure if it's best directed to you or to Bill,
- so help me with this.

1	You	did	mention,	in	describing	the	PG&E
---	-----	-----	----------	----	------------	-----	------

- 2 proposal, you critiqued the data sources and
- dataset that they were using. And yet, what we
- 4 heard from Noah a minute ago was that when the
- 5 data went to EnergyStar it did so without
- 6 reference to manufacturer and model number.
- 7 Now I don't know that those are the same
- 8 issue, but I do think that I'm really curious
- 9 about why you took manufacturer and model number
- off of the data that went into the EnergyStar
- 11 data.
- 12 MR. JOHNSON: Sure. I think we can
- address that through Bill's presentation in a
- 14 moment.
- 15 PRESIDING MEMBER PFANNENSTIEL: Okay,
- 16 great.
- 17 MR. JOHNSON: I don't want to leave that
- 18 hanging out there, either. But I think it will
- 19 come forth in Bill's comments.
- 20 PRESIDING MEMBER PFANNENSTIEL:
- 21 Terrific, thank you.
- MR. JOHNSON: Thank you.
- MR. BELT: Good afternoon. I'm Bill
- 24 Belt and I'm Senior Director of Tech Standards at
- 25 CEA.

```
1 Let me go straight to your question,
```

- 2 actually, so that I don't --
- 3 ASSOCIATE MEMBER ROSENFELD: Could you
- 4 just spell that, please.
- 5 MR. BELT: -- don't forget it.
- 6 ASSOCIATE MEMBER ROSENFELD: Could you
- just spell that, please. I'm trying to write --
- 8 MR. BELT: Yeah, Bill Belt, B-e-l-t.
- 9 ASSOCIATE MEMBER ROSENFELD: Thank you.
- MR. BELT: Thank you.
- 11 The data that we collected when first
- 12 asked by the EnergyStar folks to do that, that was
- in, I'm going to think it was late 2006, early
- 14 2007. We were very pressed for time. Our goal
- 15 was to get the folks at EPA that data as quickly
- 16 as possible.
- 17 At that point in late 2006 it occurred
- 18 to us that the quickest way to get that data was
- 19 to promise manufacturers that we would not release
- their names and their model numbers.
- 21 So the issue that Doug refers to about
- 22 the dataset, it isn't the missing manufacturer and
- 23 model numbers that concern us with the dataset.
- 24 Because, in fact, I have that information in my
- desk, you know.

```
It is that there is very little data
 1
         there relative to what's being sold in the
 2
         marketplace. It is that much of that data is
 3
 4
         actually old, the stuff on the market in 2006 is
 5
         not on the market today. You'd be hard-pressed to
 6
         find a CRT tv anywhere. There are CRT tvs in
         there. You'd be very hard-pressed to find the
 8
         number of DLP tvs that you will see in that
         dataset. That's a sort of falling segment of the
10
         market.
                   This market is characterized by very
11
         very rapid innovation. We'll talk some about that
12
13
         today. And so that dataset, of which a third of
14
         which was provided by CEA from our members, is
15
         generally old, you know.
                   What we care about, what you care about,
16
         what Noah cares about, what everybody cares about
17
18
         is not what was sold last year or last month or
         last quarter. What's going to sell tomorrow, next
19
20
         month a quarter from now, next year, that's the
21
         information that we care about. So, --
                   MR. TUTT: So, Bill, --
22
                   MR. BELT: Yes.
23
24
                   MR. TUTT: You say that data is
```

generally old.

```
1 MR. BELT: That portion of the data
```

- 2 provided by CEA.
- 3 MR. TUTT: Right.
- 4 MR. BELT: Okay.
- 5 MR. TUTT: It seemed, from the
- 6 presentations earlier this afternoon, that the
- 7 natural trend in the industry was for more
- 8 efficient televisions to be produced and sold as
- 9 you move forward in time.
- 10 So, if that data is old, would current
- data actually yield lower points on those charts?
- I mean that's what I would guess, but --
- 13 MR. BELT: That is one trend, Tim, is
- 14 for the tvs to become more efficient, all other
- 15 things being equal. But all other things are not
- 16 equal. One other trend is that the tvs are
- 17 growing in size. And that that is the consumer
- 18 choice of the day.
- 19 ASSOCIATE MEMBER ROSENFELD: But that's
- taken care of in the database.
- MR. BELT: I'm sorry?
- 22 ASSOCIATE MEMBER ROSENFELD: But that's
- 23 taken care of, all the plots that we saw today
- 24 were as a function of size.
- 25 MR. BELT: They are, of the sizes

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

selling, let's say for the data that was provided

- 2 by CEA, for the sizes being sold in 2006. And
- 3 those sizes are growing, and continue to grow.
- 4 ASSOCIATE MEMBER ROSENFELD: But there's
- 5 a disconnect here because the proposed tier one
- and tier two do increase with size.
- 7 MR. BELT: They do. Tim was asking
- 8 about a trend, and I'm just addressing a counter-
- 9 trend to that downward trend. I hope that
- 10 answered it.
- Okay, I do want to say one thing before
- 12 I actually start on my thing, is that I'm grateful
- 13 that PG&E did the right thing, you know, by me at
- 14 least, which is to describe what we are seeing in
- improvements in energy efficiency, improvements
- that are coming absent of government mandates.
- 17 They're coming because energy efficiency
- is, in fact, in the interests of this industry.
- 19 It's in the interest of all electronic products.
- 20 The less energy you use, the longer your product
- 21 is going to last. That's how it works. The less
- 22 hot it's going to be, the longer it's going to
- 23 last.
- 24 And it is a natural trend, natural
- 25 evolution of products, to become more energy

```
1 efficient on their own.
```

2	So, as I said, I'm Senior Director of
3	Tech at CEA. I wanted to talk to you about
4	CEA's proposal. We haven't spent a lot of time
5	talking about this today, but we know, sort of the
6	800-pound gorilla is, we're talking about taking
7	tvs off shelves in California. And not much has
8	been said about it at all.
9	CEA has a completely different proposal.
10	Our plan, which we submitted on July 1st, would do
11	the following three things. It would allow
12	utilities to save energy, that's their goal.
13	It would allow consumers to be able to
14	go and buy what they want when they want it with
15	the features that they want; that seems like a

the features that they want; that seems like a logical consumer goal.

And finally, it would allow the

Commission to be a leader in consumer education and in market analysis. Those are the three goals of the plan that I'm going to describe today.

The plan, itself, has three points.

Mandatory reporting of energy use data by

manufacturers. And I'll spend most of my time

talking about that. Energy use disclosures, which

is extremely important for consumers. And then an

- 1 educational campaign.
- 2 First, and probably most importantly,
- 3 any manufacturer, our plan is that any
- 4 manufacturer intending to sell in the State of
- 5 California a digital tv must submit an energy use
- 6 declaration for each model prior to sale. That
- 7 would include the model number, the display
- 8 technology, the active mode power draw under the
- 9 IEC standard.
- This is going to improve market
- 11 surveillance; it's going to improve the
- 12 understanding of energy use trends in this state.
- And it's not going to be mouse data.
- So, one side -- you know, you'll be able
- to collect data, lots of data about what is being
- sold here, how many are being sold here, what's
- going on in the market. We won't have to guess
- 18 and second guess data going forward.
- 19 Disclosure. CEA's already started to
- 20 work on disclosures. It's in the interest of our
- 21 industry, we know that, to tell consumers as much
- as they can about, you know, as much as we can
- about the product that they want to buy. So we
- 24 welcome your involvement in letting us know what
- 25 you think consumers need to know when they go out

and buy sets. And how they need to get that information.

We use disclosures here because there's 3 lot of ways that people can get their information. 4 5 They might get it from their set; they might get 6 it from the internet; they might get it from Consumers Report; they might get it from a sticky 8 on the back of the tv. I mean there's lots of ways people can get data and information. And 10 we're interested in learning what you guys know 11 about how people want their data, when they want their data, and what it is they want to know so 12 13 that they can make informed decisions.

14

15

16

17

18

19

20

21

22

23

24

25

And finally, it goes hand-in-hand with education. We want you to partner with us and industry and the rest of the stakeholders on a campaign in California, specific to California, directing consumers at this important and critical time towards EnergyStar-compliant tvs. Especially in advance of the DTV transition.

As Doug noted earlier, the time is right. We're heading quickly into major selling events, and that includes the holiday season. It also includes superbowl, that's always a really big time. And, of course, the transition, itself,

```
in February of 09. So those are the key main
```

- 2 elements, pretty simple, hopefully, to understand.
- 3 So, in summary, the key drivers for our
- 4 market in energy efficiency are innovation and
- 5 technology advancements that come naturally.
- 6 Voluntary market-oriented programs and initiatives
- 7 seem to be the most successful.
- 8 Our industry is characterized by rapid
- 9 innovation, a dynamic marketplace, highly
- 10 competitive industry, significant time-to-market
- 11 pressures, significant cost pressures, rapid rates
- 12 of market penetration and rapid transitions from
- one technology to another.
- I bring this up because I think it
- 15 points out some of the key differences between us
- and white goods.
- 17 And the problems with regulation of
- 18 technology is government regulation and mandatory
- 19 limits can never keep pace with innovation.
- 20 Product definitions change often. Products
- 21 converge. New products emerge. Technical
- 22 complexities, particularly in the consumer
- 23 electronics industry, makes it harder. And
- operating modes and functions change often.
- That's it for our presentation. We're

PRESIDING MEMBER PFANNENSTIEL: Thank

```
1 happy to answer questions.
```

- you, Mr. Belt. I just want to say something both 3 4 to you and to Doug Johnson, and that's that I 5 think it should be real clear that we really 6 support EnergyStar. We are really big believers in EnergyStar; we work with them closely. We 8 think that they have accomplished an enormous amount in brand that works well for American 10 consumers. And so it's not us or them, in fact. 11 And I think that I further want to say that I 12 13 support your idea of a market-transforming set of 14 working with customers and working with retailers, 15 I think that's fundamental to anything that we're planning to do. 16 So your proposal is fine. We're with 17 18 you. We're just not sure it's enough. And I
- you. We're just not sure it's enough. And I
 think maybe Noah said, let's do both. And I think
 it really is a question of what is the minimum
 that we want to do in California, that we should
 be doing from a technology standpoint.
- So, with that, I want to thank you.
- 24 Are there questions?
- 25 ASSOCIATE MEMBER ROSENFELD: Yeah. I

```
1 have a very general question for either of you.
```

- 2 You may both want to answer. But I'm following up
- 3 on Commissioner Pfannenstiel's point of view.
- 4 I'm used to living in a world in which
- 5 we have both -- in which we have three things,
- 6 actually. We have energy guide labels which apply
- 7 to everything. We have EnergyStar brand. And we
- 8 have standards.
- 9 Over the years, as I said at the
- 10 beginning, under these conditions with many
- 11 revisions, I think we're at our probably seventh
- 12 refrigerator standard, refrigerators have gone
- from 180 kilowatt hours a year to 400, even though
- they grew in size.
- 15 Lighting comes under standards, so when
- I got in this business typical commercial lighting
- was 4 watts a square foot; now it's about .8.
- 18 Cars have gone from 14 miles per gallon
- 19 to 28, leaving out the fact that we invented a
- 20 loophole for the SUV.
- 21 Can you give me a pep talk on why these
- two concepts are so inconsistent?
- MR. JOHNSON: Thank you, Commissioner
- 24 Rosenfeld. Doug Johnson, again, for the record.
- I think what you're addressing is what

1 we touched on earlier, in that there are different

- 2 paradigms here that reach toward the same goal.
- 3 The Commission's experience, your
- 4 experience, I believe that you're referring to,
- 5 has, in large measure, a lot to do with the
- 6 appliance sector, the white goods sector.
- 7 Their paradigm supporting transformation
- 8 toward more energy efficient products, is one in
- 9 which government regulators play the significant
- 10 role. I mean, obviously there's manufacturers
- 11 innovating in certain ways, but the dynamics of
- that industry, the products, themselves, in many
- instances are single-function or -feature type
- 14 products --
- 15 ASSOCIATE MEMBER ROSENFELD: Well, let
- me just say, I tried to mention a pretty broad
- 17 spectrum. I mean I went all the way from
- 18 automobiles to lighting.
- 19 MR. JOHNSON: Sure. Then I would expand
- 20 this to say that for each of these sectors where
- 21 we need to address energy conservation, energy
- 22 efficiency, we have to take a careful look at
- 23 industry dynamics and make a judgment about what
- 24 paradigm is most appropriate for them.
- 25 And our position, our argument, our

```
1 contribution is through the EnergyStar program.
```

- 2 That has proven, over time, to be the best way of
- 3 transforming the electronic sector, encouraging
- 4 energy efficiency improvements over time, without
- 5 harming, as I mentioned earlier, innovation,
- 6 consumer choice, product convergence or other
- 7 characteristics or qualities that are really
- 8 important to this sector and to the state.
- 9 PRESIDING MEMBER PFANNENSTIEL: Do you
- 10 have a question, Tim?
- 11 MR. TUTT: If Art's finished.
- 12 ASSOCIATE MEMBER ROSENFELD: I quess I
- 13 will make one friendly remark. I think, whether
- 14 it's an exaggeration or not, I think your picture
- of a store with lots of black screens is
- 16 compelling.
- In the case of automobiles, of course,
- 18 we have not an individual miles per gallon, but we
- 19 have a fleet average.
- I can conceive of permitting in
- 21 California a limited number of televisions with
- 22 any load whatsoever. They would have to be
- labeled. As long as the volume is kept down to a
- hundredth of a power plant or something like that.
- But, anyway, Tim, go ahead.

1 MR. TUTT: Thank you, Doug and Bill.

- 2 May I say I really appreciate you coming. I know
- 3 that this was not a great day for you guys and
- 4 it's wonderful to have your participation here.
- 5 Doug, you mentioned the EnergyStar
- 6 specification and how tvs will be shipped at
- 7 factory default settings. I think we're going to
- 8 get to that issue as we get written comments and
- 9 as we think further about this.
- 10 But, it sounded like, from the
- 11 discussion today, that tvs might have to be
- shipped in the retail setting unless they have
- 13 this forced menu innovation, is that correct, do
- 14 you think?
- 15 MR. BELT: Tim, I'm going to give what I
- think is the accurate answer, and then I will go
- 17 home and double-check it.
- 18 Tvs can be shipped in any setting the
- 19 manufacturer chooses to ship it in. And that
- setting which it chooses to ship it in is the
- 21 setting in which you will make measurements,
- 22 unless it has a forced menu option, which forces
- 23 the consumer, on its first use, to do something
- 24 different. And then it's sort of default or the
- 25 first choice that becomes the one that has to be

```
1 fixed.
```

2	And if Jon Fairhurst is still	on the
3	phone and correct me, that'd be great.	Otherwise,
1	Tim, I will double and triple check all	this stuff

5 for you.

It's more EnergyStar, your question is
more about EnergyStar than it is about the IEC
standard.

MR. TUTT: Okay, we will hopefully double check that as we move forward.

Doug, you mentioned the PG&E proposal doesn't take into account issues like a negative impact on consumers. And I think that was right after talking about one of the classes of tvs that are impacted are large-size, inexpensive tvs.

I presume they're impacted because they don't meet the standards, they use more energy.

And they're inexpensive in part because of, you know, they haven't taken some of the innovations that cost some money to reduce energy use.

But, given a first-cost versus a full-cost implication for consumers, wouldn't it actually benefit consumers to remove some of those inefficient tvs from the market?

MR. JOHNSON: Let me answer it this way.

```
1 The impacts are more than just one. And the
```

- 2 impact on large screen televisions is more than
- 3 just an impact on the less expensive. There is an
- 4 impact on the more expensive feature-rich sets, as
- 5 well.
- 6 The impact that the missing analysis
- 7 here does, in fact, have to do with consumers,
- 8 inasmuch as retailers and other segments of the
- 9 marketplace. What's in the consumer's best
- 10 interest is to deliver energy efficient products
- in such a way as the consumer has a choice at
- 12 retail; has options for features that they desire;
- 13 has a chance to receive the latest and greatest
- innovations from manufacturers.
- 15 So that the benefit to the consumers has
- 16 to do with the delivery of energy efficient
- 17 products that also meet these other
- 18 characterizations. There is already a very strong
- 19 driver in place for reducing costs in our
- 20 industry, reducing prices for consumers. That is
- 21 true.
- 22 And believe me, we will be doing further
- 23 analysis along the lines of some of these
- 24 arguments we've illustrated today. But the
- 25 consumer does benefit in more than one way by the

1 delivery of energy efficient products that do meet

- 2 these other considerations, too.
- 3 MR. TUTT: You also then had a slide
- 4 which indicated you thought there might be some
- 5 tax revenue impacts. Are you implying from that
- 6 that there would be less televisions sold in
- 7 California if we had standards?
- 8 MR. JOHNSON: PG&E's proposal is, in its
- 9 impact, would remove a large number of products
- 10 from the market. And that has significant
- 11 consequences, not only for consumers, as we just
- 12 discussed, but for the distribution chain in our
- industry; for businesses in California; for the
- manufacturers who are based and located here.
- 15 These are significant costs that need to
- 16 be considered. And aren't considered in the
- 17 PG&E's analysis and proposal.
- 18 MR. TUTT: Sure, but if those
- 19 televisions were removed from the market, I mean
- 20 wouldn't consumers still buy a different
- 21 television probably --
- MR. JOHNSON: Sure --
- MR. TUTT: -- that is on the market?
- 24 MR. JOHNSON: To your point about tax
- 25 revenue, if you're reducing the number of sets

```
sold, setting aside the concerns about consumer
```

- 2 choice and preferences, if you're reducing the
- 3 number of sets sold, you're going to see a dropoff
- 4 in revenue. Sure, there'll be purchases of a
- 5 smaller subset, but there'll be a loss to the
- 6 state of the sales tax revenue associated with
- 7 those purchases. Larger tvs that are foregone by
- 8 this proposal, so --
- 9 ASSOCIATE MEMBER ROSENFELD: Doug, can
- 10 you give an idea how big an effect you think this
- is? That is, let's supposing the consumers were
- 12 to buy -- tvs. They go out to the supermarket and
- a few brands are missing.
- 14 They went out to buy a tv. My hunch is
- 15 they're going to buy a tv. And --
- MR. TUTT: That's what I was indicating,
- 17 yeah.
- 18 ASSOCIATE MEMBER ROSENFELD: And they --
- MR. HUNGERFORD: Using the same budget.
- They would have the same budget for a tv, spend
- 21 the same amount of money.
- ASSOCIATE MEMBER ROSENFELD: Yeah,
- they've got money burning a hole in their wallet
- 24 and my impression is that it's a very small number
- of people who are going to come home and say,

```
1 golly, I just couldn't find what I wanted.
```

- 2 MR. JOHNSON: Well, let me -- at the
- 3 expense -- I don't want to be repetitious here,
- 4 but I see a hand in the audience from somebody who
- 5 can comment on this question. Please.
- 6 PRESIDING MEMBER PFANNENSTIEL: Yeah,
- 7 let's see if we can resolve this --
- 8 MR. SHARP: My name is Mark Sharp with
- 9 Panasonic. To directly address that question,
- 10 yes, I don't believe there would be fewer tvs
- sold, but there would be a lot more sold online
- from neighboring states. And these all would
- impact negatively the tax revenues.
- 14 MR. TUTT: I see. Then returning to
- your proposal, one part of our proposal is
- 16 suggesting that we mandate testing and submittal
- of data by February 17th of next year, which is
- 18 when the digital transformation happens, right?
- MR. JOHNSON: Yes.
- 20 MR. TUTT: And Noah mentioned that, you
- 21 know, there's going to be a lot of tvs purchased
- 22 prior to that digital transformation. Why don't
- we get the data before that? Why that date?
- 24 MR. JOHNSON: I think that was the
- 25 initial thought, let's tie it to something that's

```
1 major and meaningful, and the transition to
```

- 2 digital. So, I think that's why we fixed on the
- 3 February 17th date.
- 4 I think we have an interest in gathering
- 5 data sooner than that at CEA, in any case. That's
- 6 something we should further discuss.
- 7 MR. TUTT: Okay.
- 8 MR. JOHNSON: It was an initial date; it
- 9 made sense in a couple of ways. We can talk about
- 10 it further.
- 11 MR. TUTT: And then part two of your
- 12 proposal involved disclosures to consumers of
- 13 energy use information. But it doesn't sound like
- there's a standard being proposed there, or a
- 15 mandate to do that. It's more of the working with
- industry to find out the way to do it, is that
- 17 correct?
- 18 MR. JOHNSON: Yes. We want, obviously,
- 19 to give the Commission a seat at the table along
- 20 with some other parties we're reaching out to now,
- 21 in the discussions that we're having with regard
- to a proposed approach.
- We're operating under, as you know, the
- 24 federal energy legislation from last year, which
- 25 does require energy disclosures, but not labeling,

1 per se, but energy disclosures for five categories

- 2 of products and potentially more.
- 3 One of those categories is televisions.
- 4 And so we're suggesting in the second point of our
- 5 proposal, given your interest in the television
- 6 category in particular, let's sit down and, you
- 7 know, get your ideas and thoughts about which
- 8 direction we should go, based on what you know and
- 9 the research you've done.
- 10 For us there's certain elements that
- need to be in our recommendation. We'd like to
- build consensus around an approach and deliver
- 13 that to the Federal Trade Commission, which has
- 14 the ultimate authority in this case.
- 15 But it is another opportunity for
- 16 collaboration.
- MR. TUTT: Yes.
- 18 PRESIDING MEMBER PFANNENSTIEL: Thanks.
- 19 MR. TUTT: Do you know when the Federal
- 20 Trade Commission is expected to adopt the labeling
- 21 disclosure requirements?
- MR. JOHNSON: There's some timelines,
- but they're a byproduct of taking action in the
- first place. The Federal Trade Commission has a
- 25 number of responsibilities coming from the

legislation last year, and I believe it's working

- 2 through those. But plans to address, in the near
- 3 term, the beginning stages of this rulemaking on
- 4 energy disclosures for electronics.
- 5 I do not know exactly when they plan to
- 6 start that, presumably some time soon.
- 7 PRESIDING MEMBER PFANNENSTIEL: We have
- 8 some comments. Noah and Alex.
- 9 MR. HOROWITZ: Noah Horowitz with NRDC.
- 10 Doug or Bill, maybe you could help me. I've got
- 11 two things I want to talk about.
- 12 You mentioned the adverse consequences
- on the tax revenue for the state. Earlier in your
- 14 presentation you said, hey, these tvs, it's going
- 15 to cost more to make them and the tvs would cost
- 16 more. So that would, as a noneconomist, suggest
- 17 that we're going to see more tax revenue, not
- less.
- 19 And I agree with Commissioner Rosenfeld,
- 20 people who are going to buy a tv are going to buy
- 21 a tv. They're just going to be happening to buy a
- 22 more efficient one, and per your thesis, that
- 23 might cost a little more.
- I don't see how we're losing money.
- MR. JOHNSON: Well, I think the point is

1 that I thought Mr. Sharp from Panasonic explained

- that the purchasing patterns may be the same, but
- 3 the sources for those products could be outside
- 4 the State of California.
- 5 There are, in any case, revenue losses
- 6 to the state resulting from this extreme proposal
- 7 that's been put forward by PG&E.
- 8 MR. HOROWITZ: Okay. I think we
- 9 respectfully disagree on that point.
- The next one is you have, and kudos to
- 11 you, you have a very compelling shot of the empty
- 12 shelves that our consumers will be faced in the
- 13 state. And I think we've seen from many of your
- 14 members, whether it's plasma, LCD or these other
- 15 technologies, they will have a wide range of
- 16 choices. There will be an efficient alternative
- for every tv we have today.
- 18 So I don't know why consumers won't have
- a choice and won't be able to buy a tv in any form
- they want.
- 21 MR. JOHNSON: Two televisions is a
- 22 choice. And you may be comfortable with that, but
- 23 most consumers want a wide selection. Most
- 24 consumers have preferences beyond what you and I
- 25 prefer for our televisions.

```
1 So, the important thing is to deliver it
```

- 2 to the marketplace, televisions that meet a wide
- 3 range of preferences, a wide range of household
- 4 incomes, et cetera.
- 5 MR. HOROWITZ: Okay, so, again I think
- 6 more detail is needed. All five panel makers who
- 7 make all the tvs being sold in this country are
- 8 going to have models available. So, let's dive
- 9 in. I'd like to move beyond he-said/he-said.
- 10 And you mentioned incremental cost. If
- 11 you have any suggestions on what that incremental
- 12 cost, we'd love to see that introduced into the
- 13 record.
- 14 And similarly, you say feature-rich
- 15 products won't be available or be able to meet
- these energy targets. What's the feature and
- 17 what's the incremental energy use? We'd love to
- 18 see that so we can have a fact-based discussion.
- MR. JOHNSON: I'm glad you agree with us
- that there is a deficiency in the PG&E proposal
- 21 when it comes to that analysis, and it's
- definitely worth looking at.
- 23 PRESIDING MEMBER PFANNENSTIEL: Yeah, I
- 24 think --
- MR. HOROWITZ: I didn't say that, but

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

```
1 thank you.
```

- 2 PRESIDING MEMBER PFANNENSTIEL: I think
- 3 we do need some additional information here on the
- 4 record.
- 5 Alex, you had a comment?
- 6 MR. CHASE: Alex Chase, Energy
- 7 Solutions, representing PG&E. I wanted to just
- 8 address a couple clarifying issues, and then we
- 9 will provide written responses after this.
- 10 But the question came up of us relying
- on old data. And I think I showed an initial
- 12 slide showing that we were pulling data from about
- 13 760 datapoints; made all attempts to collect data
- 14 from EnergyStar, CEA; around the world, Australia,
- 15 Europe.
- We did not use all of those datapoints,
- as Mr. Belt mentioned, some of that data is old,
- including models from 2006. I think as we
- 19 mentioned in the revised proposal, we made an
- 20 attempt to pick models that were available in 2007
- 21 or later.
- As was mentioned by both gentlemen, and
- as I mentioned earlier, we're seeing general
- trends with each model year across the board,
- we're seeing more efficiency improvements.

A slide I did not show but is provided
in the appendix shows kind of an analysis of all
the datapoints showing how the efficiency
improvements change from 2006, 2007, 2008 model
year.

Generally the trend is, in terms of percentage of televisions that meet a certain level, whether it be EnergyStar, tier one, of the proposed level increases as you look at the newer and newer model years.

So, again, we would be happy to include the net datasets. My sense is, based off the projections, and I haven't seen anything to disagree with this, and if we did, of course, we would consider it, is that when you did a linear progression of the existing tv models, it would show that the models on the market today are more efficient. And generally showing that the market is going to be prepared to meet the tier one levels.

The other comment was that the old dataset included CRTs and DLPs. We recognize that, as well. That's in the revised proposal showing projected marketshare of different technologies. We take that into account, and

```
1 accordingly weight the savings estimates.
```

- So the savings estimate of a DLP is
 going to be different from an LCD, and it's going
 to be different from a plasma. Since LCDs are
 roughly, you know, approaching 90 percent of the
- 6 market, we weight those accordingly.
- In terms of duplicate tvs, I'd be happy
 to work with the CEA to scrub those from our
 dataset provided that we have some sort of way of
- doing that. If we need to keep it confidential,
- 11 you know, I'm fully prepared to send our Excel
- dataset that has each specific television.
- 13 EnergyStar doesn't tell you the model
- name or model brand, but it does have an index
- 15 number for those. So, we could provide that, and
- show the rest of the dataset. And we'd be more
- 17 than happy to get rid of any duplicates.
- 18 But, as I mentioned earlier, some of
- 19 those duplicates may be the less efficient
- 20 televisions, as well. So that may be pulling up
- 21 the dataset.
- 22 PRESIDING MEMBER PFANNENSTIEL: Thank
- you, Alex. Gary, then behind you.
- 24 MR. FERNSTROM: Gary Fernstrom speaking
- for PG&E. I'd just like to say, spinning off

1	Commissioner	Rosenfeld's	comments,	, that	PG&E	and
---	--------------	-------------	-----------	--------	------	-----

- 2 the other California investor-owned utilities are
- 3 charged by the Public Utilities Commission to
- 4 achieve energy efficiency in the state.
- 5 And we strongly believe that voluntary
- 6 incentive programs and codes and standards
- 7 advocacy are both a cost effective part of that
- 8 program portfolio.
- 9 Our program manager, Pat Eilert, has
- 10 written several papers on this issue that have
- 11 been published by ACEEE attempting to show the
- 12 relationship and the effective use of both of
- 13 these strategies.
- 14 And I'd like to note that CEA's
- 15 presentation, talking about the PG&E proposal, is
- only talking about the standards part of our
- 17 presentation today.
- 18 We also presented information on a
- 19 voluntary program that we're planning to
- 20 undertake. And CEA simply seemed to ignore that
- 21 part of the presentation.
- 22 PRESIDING MEMBER PFANNENSTIEL: Thank
- you, Gary. Yes.
- 24 MR. SHARP: Mark Sharp with Panasonic.
- I wanted to make a few points. I'm a little

1 reluctant standing up here at the moment. I feel

- like no good deed goes unpunished.
- 3 You've heard the name Panasonic
- 4 mentioned several times in a very flattering
- 5 light, and we're very appreciative and
- 6 acknowledgement from PG&E and NRDC and others
- 7 about some of our efforts to design more efficient
- 8 products.
- 9 I do want to clarify a few points and
- 10 address a couple of questions that PG&E raised
- 11 about our products.
- 12 First of all, the data on the Panasonic
- 13 models that I saw on the screen, and admittedly
- it's the first time I've seen the presentation
- from PG&E, so it's hard to verify, but it does
- 16 look essentially correct.
- 17 However, I should point out that the
- 18 savings projected includes testing being done at
- 19 the less-consumptive power modes. So I want to
- 20 make that point clear. I think that addressed one
- of your direct questions from PG&E.
- 22 Secondly, there seems to be a battle, if
- you will, of press releases and exactly where
- 24 Panasonic's efficiency levels will be at. And I
- 25 want to try to clarify that to the extent I can.

There were several citations, and they

weren't all apples-to-apples. There was a couple

stories, I think, PG&E cited that were trade press

accounts. There were a couple quotes from

executives with the company. And a couple

citations from press releases. These are all

different sources.

My understanding and my knowledge, for us, we've announced publicly it's our intention to get through our double efficiency technology for plasma to cut energy costs or consumption, if you will, not costs, by 50 percent. That is our target goal. We haven't set a date specific when we expect to get there.

We have stated clearly that we cannot get there until our new state of the art factory is complete. And that's scheduled to be online and in full production approximately May of 2009.

Typically it takes anywhere from two to four or five months for products to get from a factory over in Asia to the store shelves. So you have that sort of window or timeframe between when the product is first made and when consumers can actually purchase the product.

25 The reference to the two-thirds cut of

```
1 energy consumption was specifically a trade press
```

- 2 quote, as I looked in the presentation. I've not
- 3 heard that figure before. I'm not sure that it's
- 4 ever been made public. I'm not clear in my mind
- 5 that that's an accurate statement.
- 6 ASSOCIATE MEMBER ROSENFELD: You just
- 7 said something about -- also, and I didn't follow
- 8 that. Now you're saying you're not sure about
- 9 that two-thirds. But about two minutes ago you
- 10 mentioned 50 percent, also. What was that? That
- 11 was a goal?
- 12 MR. SHARP: What I'm saying is our
- publicly stated goal is a 50 percent reduction.
- 14 ASSOCIATE MEMBER ROSENFELD: Okay.
- 15 MR. SHARP: One of the slides that PG&E
- showed referenced two-thirds reduction. And
- 17 obviously you're trying to reconcile which is it.
- 18 And suggesting that I've not seen that two-thirds
- 19 figure before. Its citation was from a trade
- 20 press article, so I'm not sure that it's accurate.
- 21 ASSOCIATE MEMBER ROSENFELD: Thank you.
- MR. SHARP: Couple other quick points.
- 23 This double efficiency technology that we're very
- 24 proud of, it's predicated on a list of design
- 25 advances. And they were detailed on one of the

1 slides by PG&E. I believe it was slide 51 if you

- 2 want to look it up.
- 3 All these design changes come at a cost.
- 4 This idea or notion of a zero cost pathway to
- 5 energy efficiency, it doesn't exist. Everything
- 6 comes at some cost. And it's up to society to
- determine what is the appropriate level of cost,
- 8 in my view.
- 9 So, I'd like to just kind of take a step
- 10 back that the zero-cost option is not really an
- 11 option whatsoever.
- 12 Another point I want to make is I see --
- MR. TUTT: Mark, can I stop you a
- 14 second?
- MR. SHARP: Sorry, yes.
- MR. TUTT: Specifically here, I mean we
- 17 understand there's costs to developing new
- 18 efficiency technologies and new efficiency methods
- 19 and so forth.
- 20 Specifically here I think what they were
- 21 talking about was a compliance method where you
- 22 simply change the factory setting, the default
- setting, from one to another; ship it that way.
- 24 And I'm struggling to understand what
- 25 the cost of that is.

```
MR. SHARP: Well, the immediate cost is
rather nominal; it's a software change. However,
in order to even get close, no matter which
measurement level you use, if you use a brightest
torch setting, which I hate the phrase, or if you
use a less consumptive mode setting, you have to
make design changes to your product to achieve
efficiency gains.
```

And that's what I'm referring to, this evolution of design changes, new components, circuits, these all come at a cost.

A couple other quick points. There's been several references, and I'm not sure why it keeps coming up, there's references to non-high-definition tvs. And I'm really not understanding why we're talking about that.

Because as of March 2007, under federal law, every single tv sold, I think above 13 inches, has to have a digital or HD tuner. So, I think that's correct. So, you know, why we're talking about non-HD tvs is a mystery to me, quite frankly.

Couple other quick points. Noah from NRDC made a comment or a suggestion, you know, why don't we start up in November of -- was it 2009, I

believe, as the startup for the effective date of
standards?

MR. SPEAKER: For tier one.

11

or so.

- MR. SHARP: For tier one, okay. Noah

 should be aware of this, and I know he is, the

 manufacturer production schedule couldn't be

 further from a November date. Typically new

 models are showcased, as PG&E pointed out, in

 January at our trade show. You have all your

 press releases and everything comes out February
- The actual production of new models
 usually comes out in March/April timeframe and is
 staggered throughout the year.

So, if you do insist on a November date,
the problem you create is you end up testing
models that are just about ready to be replaced by
new models and new designs, which presumably would
be more efficient. And you'd rather capture the
more efficient data, I would think. So, I don't
see the value of a November date, quite honestly.

22 And a final point I wanted to make, Tim
23 from PG&E made a comment -- well, he gave a
24 presentation obviously about the rebate program
25 for televisions. It was very interesting to me

```
because I was contacted by PG&E, myself, about
```

- 2 three months ago, saying would Panasonic be
- interested in this type of rebate program as a
- 4 manufacturer.
- 5 And I said, yes, we would. I'd like to
- 6 know more about it, let's talk about it. I
- 7 haven't heard a word in three months. I walk in
- 8 today, I see a presentation, we have eight or nine
- 9 retailers that apparently are interested in
- 10 participating. That's to PG&E's credit for
- 11 recruiting them.
- 12 But, you know, I'm really curious, the
- 13 statement was made, I believe, that by giving
- 14 retailers these rebate dollars, that will spark
- 15 innovation. And I'm struggling to understand how
- 16 retailers spark innovation. I really think it's
- 17 the manufacturer that sparks the innovation in
- 18 product design. So I don't quite understand that.
- 19 But those are just a few points that I
- 20 wanted to make. I appreciate your --
- 21 PRESIDING MEMBER PFANNENSTIEL: On that
- last point I'd suggest that you talk to PG&E.
- 23 That program is not under the auspices of this
- 24 Commission, so. Thank you.
- MR. SHARP: Thank you.

1 PRESIDING MEMBER PFANNENSTIEL: There's

- another question right here. No? Somebody on the
- 3 phone?
- 4 MR. SPEAKER: Yeah.
- 5 THE OPERATOR: We do have a question
- from David Klein. Your line is open.
- 7 MR. KLEIN: Thank you. This is Dave
- 8 Klein from JVC. I have two points. First about
- 9 the database. The television industry is
- 10 incredibly diverse. There are between 40 and 60
- 11 manufacturers of televisions sold in the United
- 12 States today.
- 13 Each one of those manufacturers has, on
- 14 average, approximately 20 skews or models. Some
- 15 have larger. My company, JVC, a small- to medium-
- sized company, has 20 skews in our product line.
- 17 Due to that, that's 12 to 1600 skews for just one
- 18 year.
- 19 We have 3 to 500 in the database.
- 20 Technically, the database is a self-selected
- 21 database. The EnergyStar database was comprised
- of manufacturers who voluntarily submitted data
- from their televisions. My company was one of
- those.
- Those are the companies who are proudest

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345

```
of their products. Where are the companies that
```

- are not the good performers, the folks who are
- 3 selling the less-than-efficient set? They didn't
- 4 report to that EnergyStar database. So the
- 5 database is not only inadequate in size, but it is
- 6 skewed towards, or is not an accurate
- 7 representation of the overall industry.
- I appreciate your letting me talk. I'm
- 9 phoning in, I wish I could have been there in
- 10 person. I normally am part of these meetings, and
- 11 thanks for letting me phone in.
- 12 PRESIDING MEMBER PFANNENSTIEL: Thank
- you for participating. Other comments? Somebody
- 14 else on the phone?
- THE OPERATOR: No more questions or
- 16 comments from the phone.
- 17 PRESIDING MEMBER PFANNENSTIEL: Okay.
- 18 ASSOCIATE MEMBER ROSENFELD: One in the
- 19 back there.
- 20 PRESIDING MEMBER PFANNENSTIEL: Yeah,
- Noah, one last -- we want to try to wrap this up.
- MR. HOROWITZ: Yes, Noah Horowitz.
- 23 Mark, I appreciate your comments. I'd be curious
- 24 to know with the 50 percent savings would your
- model be able to meet the tier two standard.

1 Because that's one of the leading plasma makers.

- 2 If it doesn't, then that line may
- arguably be adjusted accordingly. We'd love to
- 4 know where you come in relative to the PG&E
- 5 proposal. And if there is an incremental cost, we
- 6 understand the sensitivity.
- 7 If there can be some dialogue, is that
- 8 the zero to 10, 10 to 50, 50 to 100, or \$500
- 9 increment. Because at the end of the day, cost
- 10 effectiveness is the measure here, and we're
- 11 unable to assess that.
- 12 PRESIDING MEMBER PFANNENSTIEL: And I
- 13 think what we're going to need is a fair amount
- 14 more hard information. I think, Noah, you're the
- one who pointed that out. A lot of what we're
- hearing is anecdotal and it is helpful to sort of
- 17 assess this at a very large picture, but I think
- we really need to drill down on many of these,
- which is the opportunity that we're going to have
- in written comments.
- 21 We have asked for written comments by
- the end of July. And we need some real
- 23 specificity in them, in terms of what is going to
- happen.
- We have one other comment? Yes.

```
1 THE OPERATOR: Excuse me, there is one
```

- 2 on the phone.
- 3 PRESIDING MEMBER PFANNENSTIEL: Okay,
- 4 well, excuse me, there's somebody in the room
- first. And then we'll take the phone comment.
- 6 MR. AHMED: Jerine Ahmed with San Diego
- 7 Gas and Electric and Southern California Gas
- 8 Company. I'm with the Codes and Standards
- 9 Program.
- 10 I just wanted to make a comment in
- supporting PG&E's efforts and the proposal.
- 12 That's all.
- 13 PRESIDING MEMBER PFANNENSTIEL: Thank
- 14 you very much. Okay, on the phone.
- 15 THE OPERATOR: Randall, your line is
- open.
- 17 MR. HIGA: Thank you. My name is
- 18 Randall Higa with Southern California Edison. I
- manage the Codes and Standards Program for SCE.
- 20 I'll also make my comments brief.
- 21 First, I'm sorry I wasn't able to make
- 22 it in person, but I would definitely like to
- 23 express Southern California Edison's support for
- 24 the PG&E and Energy Solutions television proposal.
- 25 Although I missed the earlier

```
1 presentations, I did hear Noah Horowitz and CEA's
```

- 2 presentation. And we have seen the data that
- 3 Energy Solutions and PG&E have pulled together.
- 4 We feel that the data consistently supports the
- 5 proposal.
- And we certainly appreciate the
- 7 manufacturers advancement of television
- 8 efficiency, response to the interest in the
- 9 market. And I also appreciate the proposal for
- 10 additional consumer and retailer education. I
- 11 think that will go a long way to meeting our
- 12 goals.
- 13 However, I do agree with Commissioner
- 14 Pfannenstiel's comments that we do need to go
- beyond that and have standards for televisions.
- So, that's all I have to say. Thank you
- 17 very much.
- 18 PRESIDING MEMBER PFANNENSTIEL: Thank
- 19 you, Randall.
- 20 Back to next steps here. We are going
- 21 to look for another date for the next workshop.
- 22 But I'd like that to be informed by the comments
- 23 that are forthcoming.
- I think we really need to see if there
- 25 are data issues that we need to address and how we

```
1
      can address them.
```

2	We need to look at some of the cost
3	consequences and the product, the expectation of
4	product costs and other items that people have
5	raised today that are clearly of great concern to
6	us.
7	But we need to keep moving this forward
8	to think about what is the program that makes the

most sense to the State of California to adopt.

10 Any final comments on what's going on? Art? 11

ASSOCIATE MEMBER ROSENFELD: No. 12

13 PRESIDING MEMBER PFANNENSTIEL: Tim?

14 ASSOCIATE MEMBER ROSENFELD: Very nice

15 afternoon.

9

20

21

22

23

24

25

MR. TUTT: I guess I just have one final 16 comment, and that's related to the effective dates 17 18 of standards as we're talking about manufacturing times when it makes sense to set a standard. 19

> I think we also need to keep in mind that our standards allow for inventory clearance. So they don't prohibit the sale of televisions above a certain efficiency after that date. They prohibit the sale of televisions manufactured after that date. And you still are allowed to

1	sell some of the televisions that are not as
2	efficient after the effective date. It just has
3	to be, it's the manufacture date that counts.
4	PRESIDING MEMBER PFANNENSTIEL: Anything
5	further? Thank you, all. We'll be adjourned.
6	(Whereupon, at 4:53 p.m., the Committee
7	workshop was adjourned.)

CERTIFICATE OF REPORTER

I, PETER PETTY, an Electronic Reporter, do hereby certify that I am a disinterested person herein; that I recorded the foregoing California Energy Commission Committee Workshop; that it was thereafter transcribed into typewriting.

I further certify that I am not of counsel or attorney for any of the parties to said workshop, nor in any way interested in outcome of said workshop.

IN WITNESS WHEREOF, I have hereunto set my hand this 31st day of July, 2008.

PETERS SHORTHAND REPORTING CORPORATION (916) 362-2345
