## **Move rapidly towards all electric buildings**

As an Architect specializing in net zero buildings, I understand the technology is readily available to switch our building infrastructure rapidly towards all electric. We do not have time to delay our transition and it is imperative that California leads the way and sets an example for the rest of the country. Much of the south of the United States is already all electric, although with less efficient systems and powered by high carbon sources. The technology is here and proven and California can help lead the way to widespread adoption. In addition, gas use in buildings is one of the biggest point source pollution generators in our homes and businesses. It is imperative that we codify health buildings while also moving our buildings infrastructure towards net-zero energy.
