

DOCKETED

Docket Number:	19-BSTD-03
Project Title:	2022 Energy Code Pre-Rulemaking
TN #:	235825
Document Title:	Support for Decarbonization Policies, Practices and Programs
Description:	Letter from over 50 businesses and higher education institutions in support of building decarbonization policies, practices and programs. Docketed by staff.
Filer:	Adrian Ownby
Organization:	California Energy Commission
Submitter Role:	Public Agency
Submission Date:	12/2/2020 8:52:30 AM
Docketed Date:	12/2/2020

December 1, 2020

The Honorable Gavin Newsom
Governor of California
State Capital, First Floor
Sacramento, CA 95814

California Energy Commission
1516 9th St
Sacramento, CA 9581

Dear Governor Newsom, California Energy Commission Commissioners and Staff:

As businesses, higher education institutions, healthcare systems, and associations across the West, we write to urge our state leaders to pursue ambitious building decarbonization policies. Optimizing energy use in the building sector will save businesses, institutions, and residents money while reducing emissions, spurring innovation in building design and construction, improving public health, and helping drive economic recovery.

Climate change poses a significant risk to our long-term economic success, impacts the health and livelihood of the communities in which we operate and live, and disrupts the value chains on which we rely. We are already feeling the effects of climate change across the West — from increased heat waves and extreme wildfires, to drought and hazardous air quality.

Because of these risks, we are making significant commitments and investments to reduce our greenhouse gas emissions.¹ The energy use at our facilities is a significant cost and increasing our energy efficiency is a major focus of our sustainability efforts. Clean energy investments are an economic opportunity, saving major energy buyers in the U.S. billions of dollars a year while reducing emissions.² Including robust building decarbonization policies and programs in our tool box will help us meet our goals faster and more cost-effectively, all while reducing climate-related risk.

Building decarbonization policies and practices include energy efficiency programs; building energy benchmarking programs; sustainable building design approaches; performance standards for new and existing buildings; strategic electrification; building energy and water codes; strategic energy management; building-level distributed generation and storage; and demand-side management (DSM) programs. Building decarbonization practices can provide energy users valuable insights into how much energy a building uses, helping us better manage performance, identify opportunities to cut energy costs, and make informed capital investment decisions. All consumers, businesses, and institutions benefit when we eliminate energy waste.

At the microgrid, community and grid scale level, building decarbonization investments also support resiliency. As climate change exacerbates extreme weather events, building decarbonization policies—such as those supporting distributed energy resources and demand response — enable strategic grid management and enhance grid resiliency, ensuring all customers have access to reliable power.

Decarbonizing the building sector will also generate economic, public health, and equity benefits. Investing in more efficient buildings will help the West build a more robust and resilient economy as we grapple with the challenges of the COVID-19 pandemic, creating local jobs that pay well and are not easily outsourced.³ Inefficient buildings and appliances disproportionately impact the health and financial stability of marginalized and low-income communities — the same communities most affected by the pandemic. Investments in these communities

¹ Nearly early half of all Fortune 500 companies have set goals to reduce greenhouse gas emissions, procure renewable energy, and invest in energy efficiency, see: <https://www.ceres.org/resources/reports/power-forward-3>; Health systems in the U.S. have committed to increasing climate resilience and reducing greenhouse gas emissions, see: <https://noharm-uscanada.org/healthcareclimatechallenge>; and Colleges and universities are making bold commitments to address climate change and resilience, integrating these into their curriculum, research, and campus operations, see: <https://secondnature.org/signatory-handbook/climate-leadership-network-map/>.

² In 2017, major energy buyers in the US saved nearly \$3.7 billion a year from investments in clean energy, see: <https://www.ceres.org/resources/reports/power-forward-3>.

can reduce exposure to hazardous indoor and outdoor air pollutants and improve energy affordability, improving public health and raising disposable incomes.⁴

We strongly support the establishment of robust building decarbonization policies. As the West recovers from the impacts of the COVID-19 pandemic, these policies will help ensure the long-term health of the region's economy and citizens.

Sincerely,
