I do not support the plant restarting until all repairs are finished

The whole point of a combined cycle plant is to produce less co2 per megawatt. Running the plant without the steam cycle turbine is like running a car that has 3 cylinders unattached to the crankshaft with no catalytic converter. It's a step backward in controlling greenhouse emissions. Without this incentive, Calpine will take much longer to bring the steam turbine back, allowing it to extract as much power as possible per ton of co2 produced.

It is imperative they rebuild the steam turbine before being allowed to restart, and the plant be returned to its former (high) efficiency
