Save Diablo Canyon!

Nuclear is the only carbon-free source of electricity that is capable of supporting a grid on its own. Intermittent renewables cannot and therefore require either natural gas backup or massive grid scale energy storage. So far, no technology is remotely capable of providing that storage, so renewable energy continues to lock in fossil fuel usage. Nuclear also has drastically lower land use and material throughput requirements than renewables. We need to be building more nuclear plants as quickly as possible, not tearing down existing ones. Closing Diablo, which provides 9% of California's electricity will make our grid more expensive, more polluting, and less reliable. Keep Diablo Canyon open!
