DCCP 20 more years of reliable cost effective power

I like being able to turn my lights on when I want to.

Solar panels and their raw materials are largely made by slave labor in China. They also become hazardous landfill waste when their 20 year service life expires. Not very green or reliable.

We're in a mega drought and our reservoirs can no longer be relied upon for electricity.

China and Russia don't like us. The geopolitical consequences of letting them supply our energy raw materials is insane.

California's energy grid (and the usa) does not have enough capacity to meet demand.

You must keep Diablo canyon open. And we must reprocess our waste into more nuclear fuel like the rest of the world does. Burying it is stupid.
