Allow Diablo Canyon to continue operating

Nuclear power is one of the safest, most reliable, and lowest-carbon ways to provide base-load power to ensure grid stability in increasingly unstable weather conditions as the planet warms. Shuttering the Diablo Canyon power plant will be horrible for both the planet and California's energy security.

Fully renewable power is a fantastic goal to work towards, but the requisite grid-scale storage technologies are immature and expensive. Diablo Canyon works today and frankly, if we were serious about zero-carbon energy use, we would build more nuclear plants.
