Provide further support and focus on new hydrogen production technology

Life cycle carbon intensity should be the focus on technology selection, rather than a blind focus on particular technologies (like electrolysis). This should also be feedstock agnostic.

The focus on distributed hydrogen production is important for delivering cost-effective hydrogen since the cost of transportation is significant.

The support of mid-TRL technology is critical for the development of low-carbon, low-electricity, low-water hydrogen production technology that is currently pre-commercial.
