Air quality

The power plant units should only operate during daylight hours. Because the exhaust stacks are only 100 feet tall, the exhaust emissions spread Laterally during calm wind conditions and on shore to off shore periods. These Conditions occur every day sending pollution into the SDG&E maintainable facility and homes on the north end of Terammar subdivision. Black particular particles are seen on all horizontal house external surfaces. The old air quality study that caused the Encinsa power plant to require a 400 ft exhaust stack will verify my allegation. This time it is not sulfer from fuel oil but natural gas particulate. Thank you
