Memo

To: Fountain Wind LLC From: Kaitlyn Heck, Air Quality Specialist
and Briette Shea, Air Quality and Climate Change Consultant

Project/File: Fountain Wind Energy Project Date: March 1, 2024

Reference: Air Quality Technical Memorandum Update for the Fountain Wind Energy Project

INTRODUCTION

Purpose

The purpose of this Air Quality Technical Memorandum Update (Memo) is to support the Fountain Wind Energy Project (Project) located within unincorporated Shasta County (County).

In 2023, Stantec Consulting Services Inc (Stantec) prepared an Air Quality Technical Memorandum for the Project to compare air quality emissions associated with a 2019 iteration of the Project. Following submittal of the 2023 Air Quality Technical Memorandum, more detailed information regarding construction and operational trip rates and trip lengths from the Traffic Study was prepared in February 2024 by Westwood. This Memo presents the results of the updated analysis.

Project Location

The project site is located approximately one mile west of the existing Hatchet Ridge Wind Project, six miles west of Burney, 35 miles northeast of Redding, immediately south of State Route (SR) 299, and adjacent to the private recreational facility of Moose Camp. Other communities within approximately ten miles of the project site include Montgomery Creek, Round Mountain, Wengler, and Big Bend.

Project Description

The Project proposes to construct 48 wind turbines with a total nameplate capacity of 205 megawatts (MW) as well as associated infrastructure and facilities. These facilities would include a 34.5-kilovolt (kV) overhead and underground electrical collector system to connect turbines together and to an on-site collector substation; overhead and underground fiber-optic communication lines; an on-site switching station to connect the Project to the existing regional grid operated by the Pacific Gas and Electric Company (PG&E); a temporary construction and equipment laydown area; nine temporary laydown areas distributed throughout the project site to store and stage building materials and equipment; an operation and maintenance (O&M) facility with employee parking; up to four permanent meteorological evaluation towers (METs); temporary, episodic deployment of mobile Sonic Detection and Ranging (SoDAR) or Light Detection and Ranging (LiDAR) systems within identified disturbance areas (e.g., at MET locations); two storage sheds; and three temporary batch plants. New access roads would be constructed within the project site, and the existing roads on-site would be improved.

Reference: Air Quality Technical Memorandum Update for the Fountain Wind Energy Project

METHODOLOGY

The construction emissions were calculated with the California Emissions Estimator Model (CalEEMod), the California Air Resources Board's 2021 Emission FACTor (EMFAC) Database, and helicopter emission factors. Off-road equipment and off-site vehicle particulate matter (PM) emissions were calculated using CalEEMod. On-site pickup truck and off-site vehicle reactive organic gas (ROG) and nitrogen oxide (NOx) emissions were calculated using EMFAC. The emissions for the Concrete Batch Plants phase incorporates PM emissions associated with aggregate transport derived from the U.S. Environmental Protection Agency's (USEPA's) AP-42 Emission Factors. The emissions for the Overhead Collector System phase incorporates the use of helicopters using emission factors and fuel burn rates obtained from the Federal Office of Civil Aviation (FOCA) Guidance on Determination of Helicopter Emissions, Edition 2.

Based on the 2019 Analysis, it was assumed that construction phases may occur concurrently during Year 1 and Year 2. Concurrent activities for each Project component that would emit the greatest amount of daily emissions would be as follows:

Year 1 of Construction

- Timber Removal and Grubbing; and
- Grading and Access Road Work

Year 2 of Construction

- Turbine and Transformer Installation;
- Substation and O&M Building Installation;
- Underground Collector System; and
- Overhead Collector Systems.

Modeling assumptions, calculation spreadsheets, and CalEEMod output files are provided in Attachment A.

RESULTS

Construction

Construction emissions are generated from off-road construction equipment, worker and hauling vehicle trips, and dust emissions from unpaved roadways. Table 1 below shows the unmitigated construction emissions from the Project.

Table 1: Unmitigated Construction Emissions

Phase	Source	ROG	NOx	PM ₁₀	PM _{2.5}
Peak Construction Emissions - First Year (pounds per day)					
Timber Removal and Grubbing	Equipment	11.29	80.27	3.04	2.80

Source: See Attachment A

Operation

According to the Traffic Study, during post-construction activities, the Project would generate approximately 240 vehicle miles traveled per day. The operational emissions calculated within Stantec's 2023 Air Quality Technical Memorandum are more conservative than this estimate. The 2023 Air Quality Technical Memorandum assumed up to 24 vehicle trips per day with each vehicle traveling 50 miles per trip (1,200 VMT per day). Therefore, the operational emissions disclosed within the 2023 Air Quality Technical Memorandum presents a conservative estimate.

Respectfully,

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

Fountain Wind, Year 1 - Shasta County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied**3.2 Timber Removal and Grubbing - 2024****Unmitigated Construction On-Site**

Project Characteristics -

Land Use -

Construction Phase - Construction schedule provided, no construction anticipated during winter months (January through March).

Off-road Equipment - provided

Off-road Equipment - construction equipment provided. Turbine delivery trucks modeled within hauling truck trips.

Off-road Equipment - construction equipment provided

Trips and VMT - construction trips pulled from 2019, reduced based on project description

On-road Fugitive Dust - per 2019 CalEEMod assumptions

Fountain Wind, Year 2 - Shasta County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Grading - total acres graded and material exported assumed to be ~0.67 of 2019 assumptions

Vehicle Trips - construction only

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Water And Wastewater - construction only

Construction Off-road Equipment Mitigation - based on 2019 assumptions; reduction percentages based on SCAQMD fugitive dust reductions and CalEEMod assumptions

Fleet Mix -

Stationary Sources - Emergency Generators and Fire Pumps -

3.1 Mitigation Measures Construction

Fountain Wind, Year 2 - Shasta County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Clean Paved Roads

Notes:

Emission factors and fuel burn rates obtained from the FOCA Guidance on Determination of Helicopter Emissions, Edition 2, December 2015. LTO = Landing and take-off cycle.

Fugitive dust emission factor source: Dr. J. A. Giles et al. December 31, 2007 Particulate Matter Emissions for Dust from Unique Military Activities. Measurements indicate approximately 0.5 kg of PM10 emitted during takeoff and 1 kg during landing. Measurements were conducted in dry, unpaved desert in Arizona. The model used in testing was a UH-1H Huey, generally similar to the helicopter above. The 0.5 kg takeoff and 1 kg landing emission factor is conservatively assumed for all helicopters. The landing and takeoff surface is assumed to be watered, reducing fugitive dust emissions 55%.

PM2.5 Emission Factor source: WRAF Fugitive Dust Handbook. The emission factor for PM2.5 for unpaved roads is 0.1 x PM10 emissions. Greenhouse gas emission factors and global warming potentials obtained from California Climate Action Registry General Reporting Protocol, Version 3.0, May 2019.

Density of fuel from ExxonMobil Aviation World Jet Fuel Specifications, 2009 Edition.

775-840 kg/m³ = 6.47 - 7.01 kg/l gallon

Average Density = 6.74 kg/l gallon

Proposed Project would construct 5 miles of overhead lines as compared to the 2019 analysis which assumed 12 miles. Therefore, only 42% (5 / 12 = 0.417) of helicopter hours required in 2019 would be required for the Proposed Project.

Fugitive Dust Associated Concrete Batch Plants

Source	PM10 (lb/CY)	2019 concrete (CY)	Ratio	2022 concrete (CY)	Ibs PM10	Ibs PM2.5
Aggregate Delivery to Ground Storage	0.0031	36,946	0.67	24630.67	76.36	51.46
San Delivery to Ground Storage	0.0007	36,946	0.67	24630.67	17.24	11.62

Proposed Project would construct 48 wind towers as compared to the 2019 analysis which assumed 72 wind turbines. Therefore, only 67% (48 / 72 = 0.67) of concrete required in 2019 would be required for the Proposed Project.
