Status Update and ETA

It's been a year since this site started receiving comments. I don't see any forward motion that is meaningful to actual people living in actual houses with actual fossil fuel burning appliances. If the intent is to cut down carbon by helping people convert to electric...when will the talk stop and an actual process that people can engage with start?

I'm having to make a decision soon about a fossil fuel appliance (gas stove) that I can't afford to electrify as it will take some electrical retrofitting. I would be glad to go electric...but I can't make a less than \$1K purchase into a \$4K+ purchase (do to electrical retrofitting needed) to do so. Once the unit fails, I'll have to go with another gas appliance. I'm sure this is true across California as there isn't any real forward motion seen in this.

If the government is really serious about this, then let's see something tangible.

Thanks for your help and work.
