DOCKETED	
Docket Number:	21-ESR-01
Project Title:	Resource Planning and Reliability
TN #:	262897
Document Title:	Combined Slide Deck Summer Energy Reliability Workshop
Description:	N/A
Filer:	Mikayla Roberts
Organization:	California Energy Commission
Submitter Role:	Commission Staff
Submission Date:	5/2/2025 8:31:21 AM
Docketed Date:	5/2/2025

### **Summer Energy Reliability Workshop**

California Energy Commission

Date: May 2, 2025

- Administrative questions: Zoom Chat function
- Public comments due May 16, 2025
- CEC Docket 21-ESR-01

### **Comments from the Dais**

# **Introduction – Workshop Overview**

- Anticipated Summer Conditions
- California Resources
- Summer Reliability Assessments
  - Electricity
  - Fossil Gas
  - Publicly Owned Utilities

# **Panel: Anticipated Summer Conditions**

Moderator: David Erne

A. Westwide Weather, Amber Motley, California ISO

- B. Westwide Fire Outlook, Jeff Fuentes, CALFIRE
- C. Westwide Reliability, Branden Sudduth, WECC

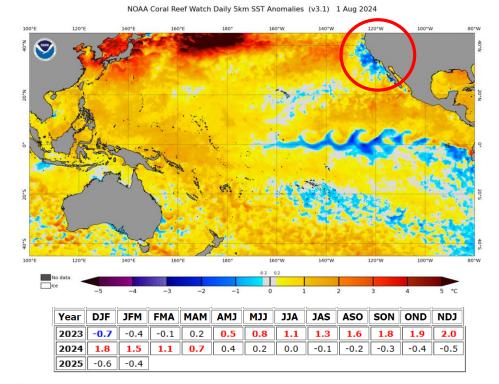

### 2025 Summer Meteorological Outlook

Amber Motley Director, Short Term Forecasting

ISO Public

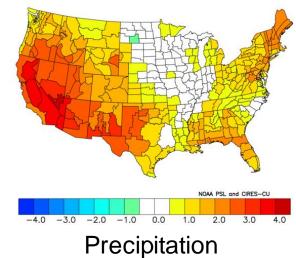

### 2024 Summer: Observations

- Above normal temperatures throughout the entire west, strongest for CA and Desert SW
  - Hottest in June and July, near normal August
- Near normal precipitation across the west

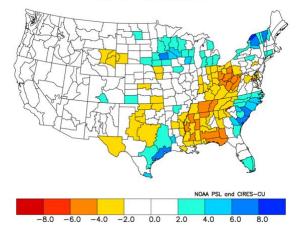

#### Temperature

NOAA/NCEI Climate Division Precipitation Anomalies (in) Jun to Aug 2024 Versus 1991–2020 Longterm Average

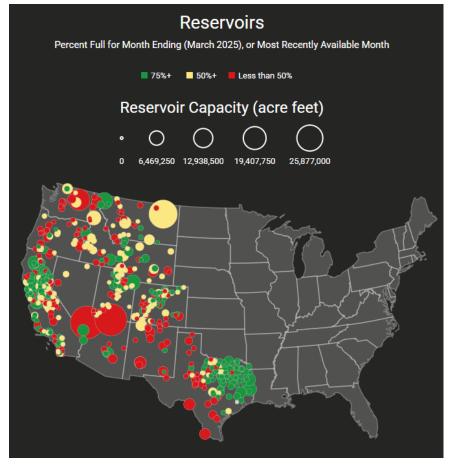

# Above normal snow water equivalent across the mountains, but many reservoirs still below 50% capacity

### Similar years: 2024, 2021, 2017, 2014, 2003

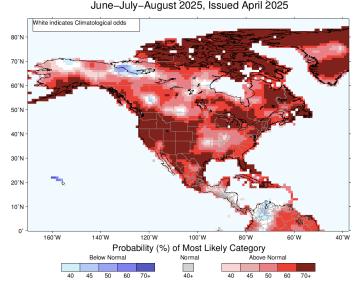

- Focusing on years with similar SST and El Niño patterns and trends
- Watching positioning of ridge
  - Shifting of the ridge of heat further north can allow for hotter temperatures further north

### Temperature Outlook June – August 2025

- First half of summer could have higher magnitude of above normal temperatures.
- Above normal temperatures are most likely to occur across the Northern and Central western US.
- A slightly lower chance of above normal temperatures in coastal locations.

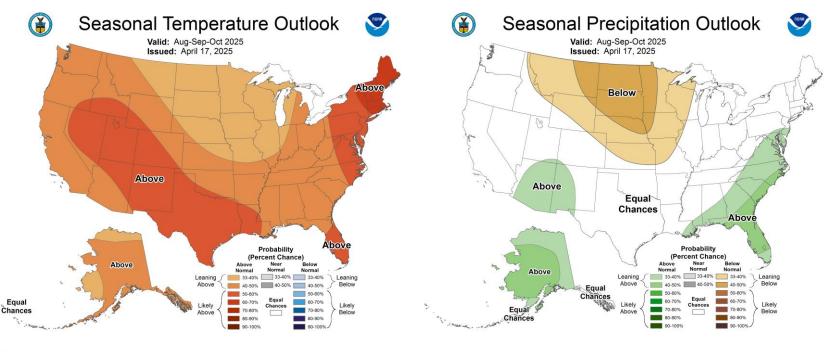

### Weather Outlook August – October 2025

- Potential for above normal temperatures in August and September, primarily for the western interior
- Continued risk for below normal rainfall for Pacific NW and above normal rainfall for the Desert SW

### California Seasonal Outlook May – August, 2025

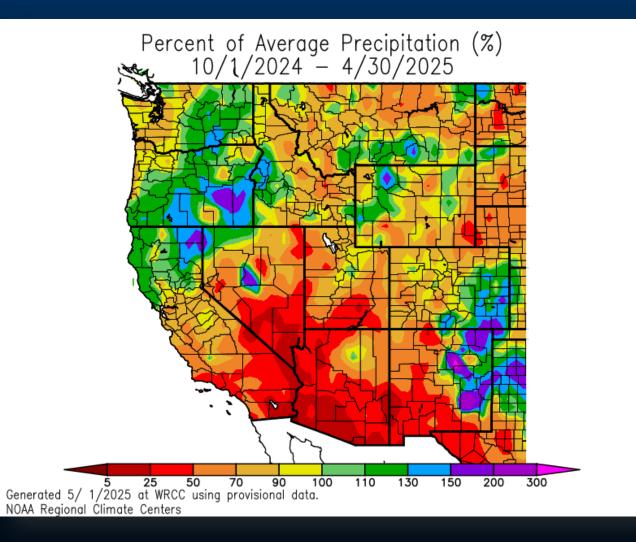

Summer Energy Reliability Workshop

### Water Year: Percent of Average Precipitation

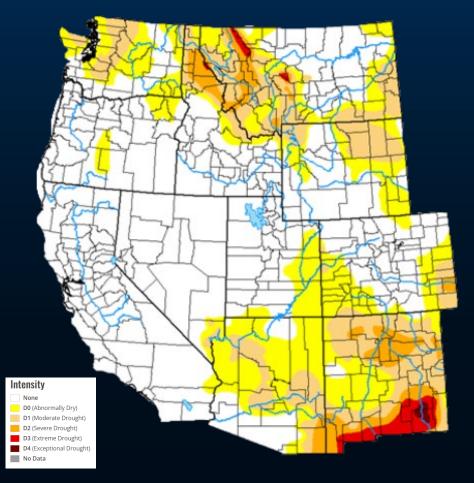

- Near normal to above normal precipitation totals in the Pacific Northwest.
- Below normal precipitation across most of Southern California during the current water year.
- NOAA Regional Climate Center data indicates that all areas South of Bakersfield is anywhere from less than 25% to 70% percent of average precipitation.

### US Drought Monitor: Western Region

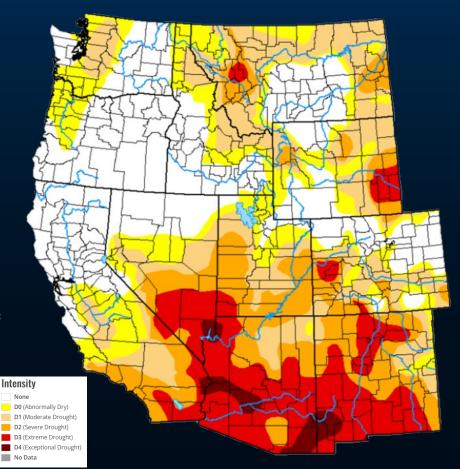

#### Drought Status April 30, 2024

#### Moisture deficits led to the expansion of Moderate to Exceptional Drought in Southern California.

 Abnormal dryness into southwestern Washington and much of northwestern Oregon.

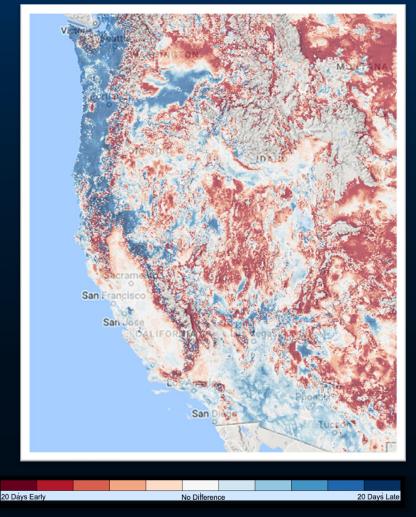

#### Drought Status April 29, 2025

### Spring Status 2025

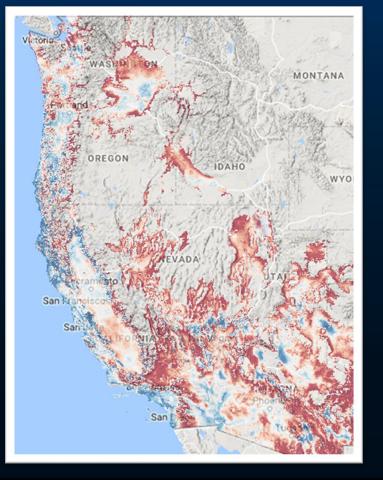

#### Spring Leaf Index

### How does this spring compare to normal?

#### Spring Bloom Index

20 Days Early					No Differen	ce		20	) Days Late

### Fuels Discussion: Herbaceous Live Fuels

#### April 1, 2025

May 1, 2025

#### Northern California

- The green-up process in live fuels continued to progress further up the slopes during April, with various stages of woody fuel green-up as high as 5,000 feet by the end of the month.
- Herbaceous fuels found in the fully exposed and/or thin soil areas started to show signs of curing during the latter half of the month below 1,000 feet.

#### Southern California

- Several pulses of moisture in February and March coupled with the recent rain this week is allowing green-up to continue. This has also resulted in an increased yield of the grass crop and fine fuels.
- Drier conditions become more likely as we transition into the summer months. The long-term drying trends allow for less moisture in the larger live fuel types such as timber.

### California: Four Month Significant Fire Potential

#### May – August 2025 California Highlights

#### Northern California

- Atmospheric patterns in May are likely to be similar to April. Near to above normal precipitation east of the Cascade-Sierra crest and likely below normal precipitation west of the crest.
- From June through August, expect a shift towards warmer and drier than normal conditions. Significant Fire potential is projected to be normal for May, then trending near to above normal during June and July favoring the interior or away from coastal influences.

#### Southern California

- Near normal fire potential for May, slightly tilting towards above normal fire potential for the Sierra Foothills, Central Coast Interior, Western and Southern Mountains for June.
- For July and August odds of large fire potential extending into Southern Sierras, and South Coasts as well.

#### **Pacific Northwest**

• May predicted to be near normal large fire potential, with slightly higher risk in in drought-prone eastern areas of WA. July and August much of the Pacific Northwest will rise to above normal Large Fire Potential.

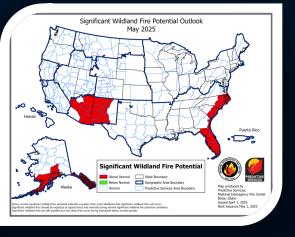

### California: Four Month Significant Fire Potential May June July August

### 2025 Summer Reliability Outlook

#### **Prepared for the California Energy Commission**

**Branden Sudduth** 

Vice President of Reliability Planning & Performance Analysis

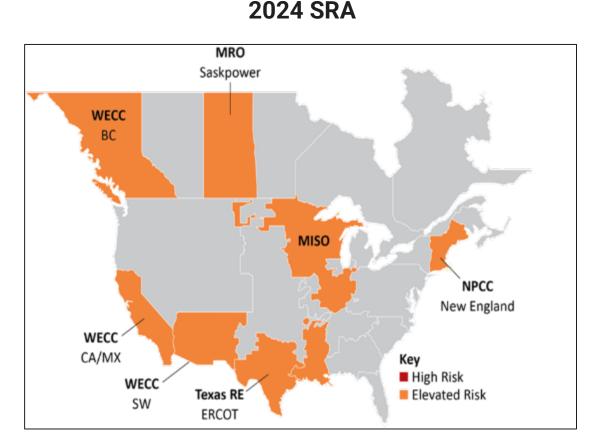

Electric Reliability & Security for the West

May 2, 2025

<Limited-Disclosure>

### Summer Reliability Assessment (SRA)

- Risk identification June– September
- Extreme Conditions:
  - At or above 90/10 demand forecast
  - Abnormally high generator outages
  - Low renewable availability
- Normal Conditions:
  - Average (50/50) demand conditions
  - Typical outages & renewable availability

	Seasonal Risk Assessment Summary
High	Potential for insufficient operating reserves in normal peak conditions
Elevated	Potential for insufficient operating reserves in extreme conditions
Normal	Sufficient operating reserves expected

#### 15

Ŵ

<Limited-Disclosure>

### **Regional Boundaries**

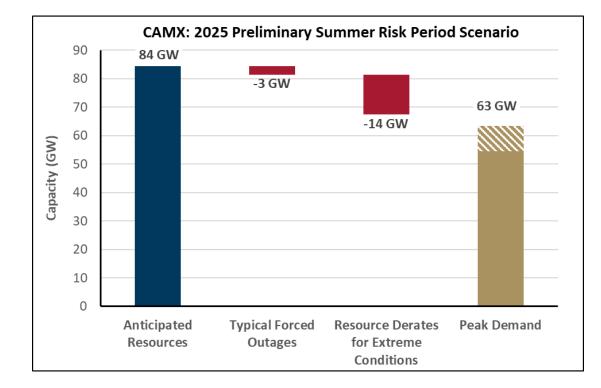

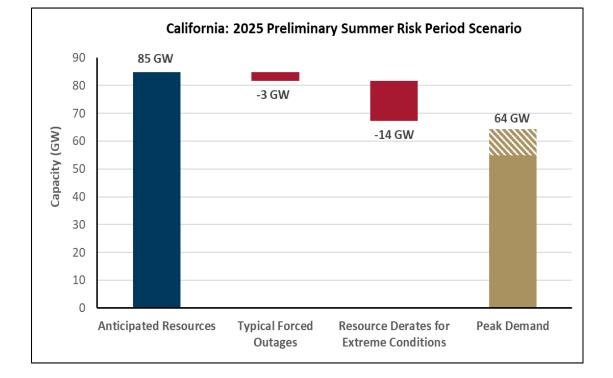

- NERC transmission planning region guidance:
  - Separate Canadian Provinces & Mexico
  - Avoid large interregional transmission within a region
  - One or two states per region
- More granularity for the Northwest
- Generally separated by known constraints in transfer capability
- Consistent with WECC PCM regions
- Regional similarities in climate

### 2025 Preliminary SRA Results

- CAMX/California prediction: Normal Risk
  - Peak hour at HE 17 in early September

## **Demand Forecast**

Summer Energy Reliability Workshop

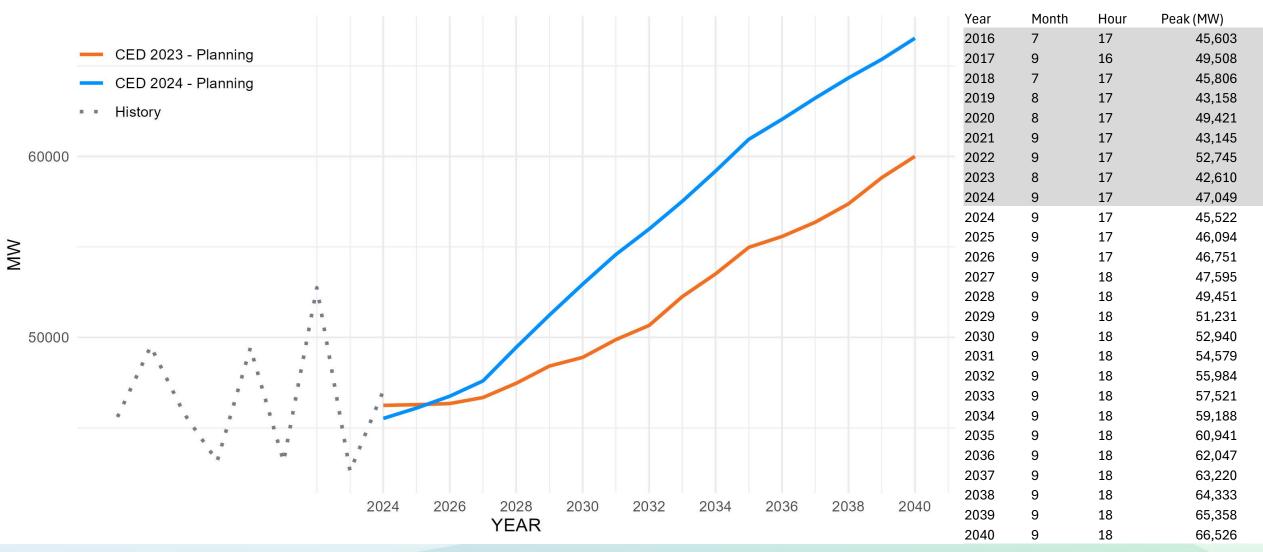

# **CED 2024 Forecast Updates**

- Historical peak/sales data update (↓)
- Self-gen changes
  - PV capacity factors  $(\uparrow\downarrow)$
- Econ-Demo update
  - Demographics (<sup>↑</sup>)
  - Economics  $(\downarrow)$

Arrows indicate that an update exerted generally increasing (↑), decreasing (↓), mixed (↑↓), or no (=) pressure on energy demand.

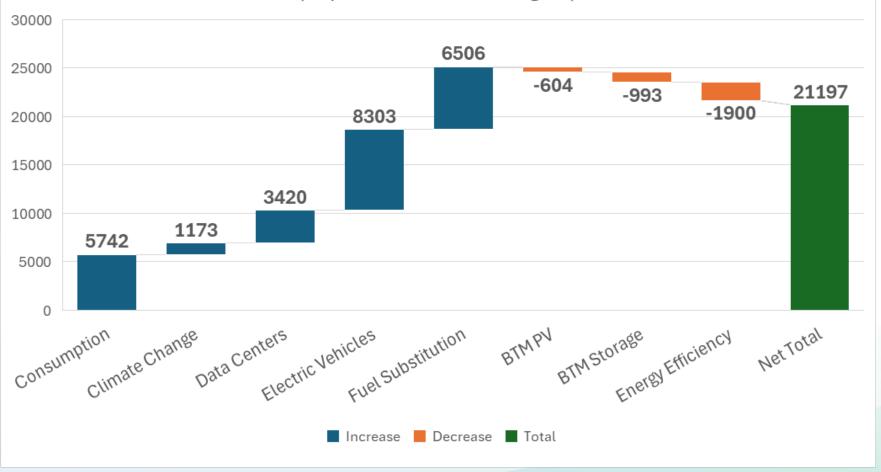

- "Additional Achievable" modifier updates (↑)
  - AAEE (=)
  - AAFS (↑↓)
  - AATE (↑)
- Re-estimated consumption profiles (↑↓)
- New data and model for data centers (↑)

# **Components of Peak Growth**

CED 2024 Planning - CAISO load growth (MW) from 2024 to 2040 (September, hour ending 18)

 Growth in the forecast is primarily driven by data centers and building and transportation electrification

 Growth in installed behind-the-meter PV and storage capacity is significant, but impacts are small during the system peak hour

- Load forecasts (SVP, Palo Alto)
- Application data (PG&E, San Jose, SCE)
  - Ramping schedules
  - Geographic data
- Planning Forecast projects ~3.5 GW growth in data center load by 2040

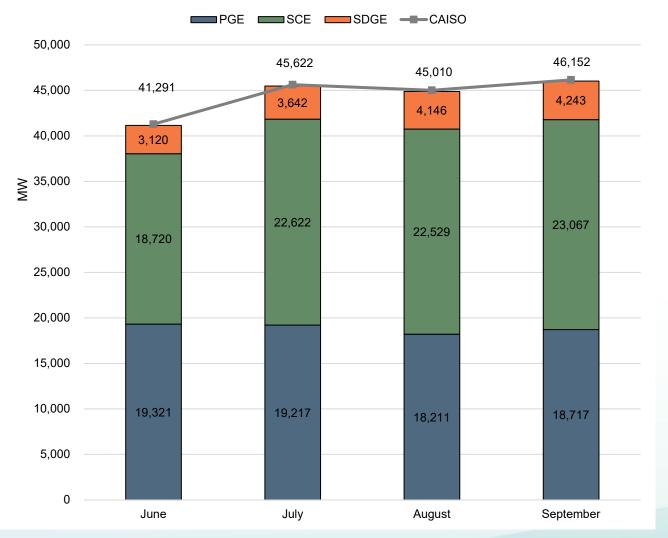

# **Climate Considerations**

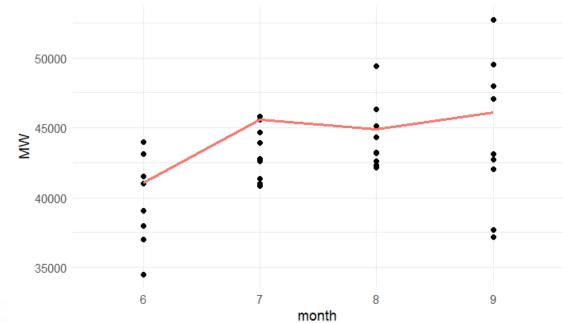

Annual Cooling Degree Days (Statewide Average) 1800 1700 1600 1500 1400 1300 1200 — 30-year historical average 1100 Climate-impacted normal (present-day) 1000 Climate-impacted normal (projected) 900 — History 800 1985 2035 2040 1990 1995 2000 2005 2010 2015 2020 2025 2030

 Staff leverage downscaled, localized climate projections to establish "normal" levels of daily peak temperature as well as heating- and coolingdegree-days for each forecast year

 Forecast accounts for average temperature increases over a 50year rolling window

# **Summer 2025 – Monthly Peaks**

Above: Comparison of CAISO-coincident monthly peaks for forecast year 2025 to historical observations (reconstructed)

Left: Contribution of each IOU TAC area toward the CAISO-coincident monthly peaks

### New MWs Online - Nameplate By Year and Resource Type

Data includes projects online as of April 9, 2025

#### 2025 MW 2020-2025 2024 MW **Technology Type** (to date) **Cumulative MW** SOLAR 2,227 70 8,039 STORAGE 3,678 802 10,719 68 HYBRID (SOLAR + STORAGE) 503 1.841 WIND 260 27 1,145 GEOTHERMAL 41 41 0 HYDRO, BIOMASS, BIOGAS 0.5 39 0 Subtotal Total New SB100 Resources, IN-CAISO 6,709 966 21,825 NATURAL GAS, incl. Alamitos & Huntington Beach 63 1,539 0 **Total New Resources, IN-CAISO** 6,772 966 23,364 New Imports, Pseudo-Tie or Dynamically Scheduled 280 0 1.883 Total New Resources, including Imports 7,054 966 25,247

## **New Online & Expected Resources in CAISO**

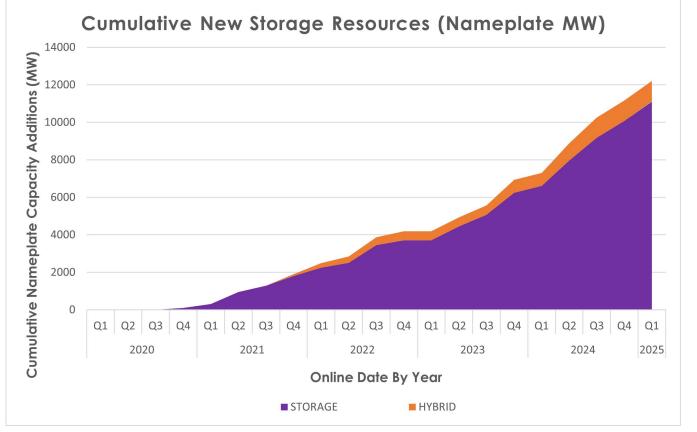

**Note:** Data shown here includes new resources added to CAISO grid, including imports. "Other" resources includes geothermal, biomass, biogas, and hydropower.

 Online – Over 25,000 MW of new resources were added between 2020 and 2025 to date

- 2024 Over 7,000 MW of new resources came online in 2024, the highest clean energy year on record
- Future Over 20,000 MW of additional resources are currently under contract and in development; Additional contracting will be done to fully meet the CPUC IRP orders by 2028.
- **Technology** Most of the new resources installed and expected are battery storage, solar, or hybrids (usually solar+storage).

California Public Utilities Commission

## Total Storage Online By Year

**Note**: Data shown here shows a snapshot of new resources added to the CAISO grid Q12020 – Q12025, including specified CAISO imports. Hybrids include some storage, and some other (usually solar) technology. MW shown here only include the storage portion of hybrids.

Data includes projects online as of April 9, 2025

- **Installed to date:** Over 12,000 MW of storage nameplate capacity is online serving the grid as of April 2025, including imports.
  - Includes ~150 MW of storage added prior to 2020
  - Includes standalone battery storage and the storage component of hybrid resources
- Expected future installs: ~15,000 MW nameplate capacity of additional storage resources are under contract and expected to come online by 2028.

## **2024 New Resource Development**

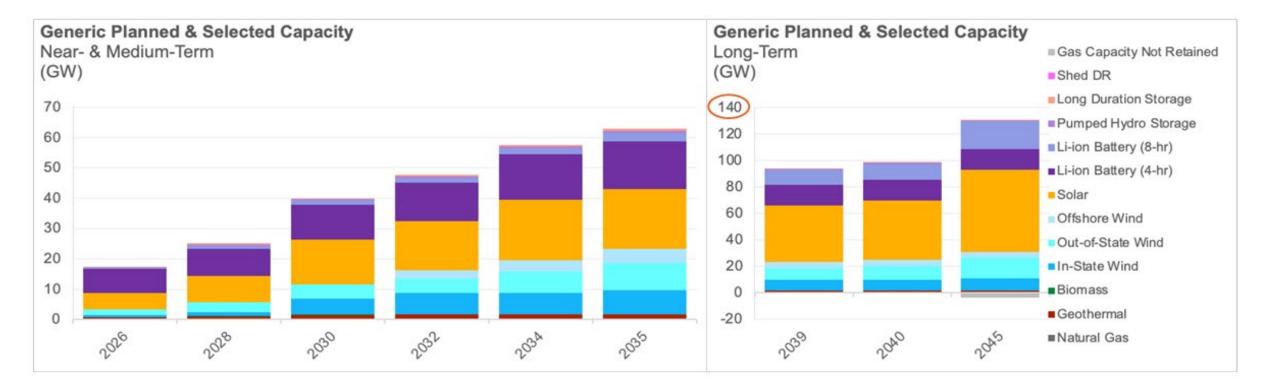

#### 2024 | Top Counties

County	Deployed MWs	Deployed Projects
Riverside	2,549	21
Fresno	740	11
Kern	703	13
San Bernardino	550	9
Imperial	399	3
Stanislaus	387	7
Los Angeles	352	12
Solano	230	1
Tulare	86	3
San Diego	76	10

California Public Utilities

## New Resource Buildout in 25-26 Transmission Planning Process Portfolio (TPP)

 In Feb 2025, CPUC adopted a Transmission Planning Process Portfolio which expects 63 GW of new clean energy resources will be built by 2035 and 127 GW by 2045.

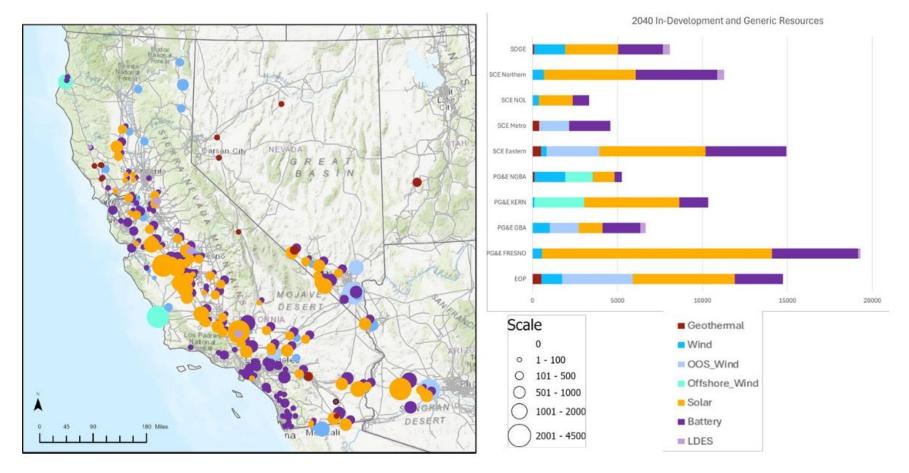

Source: <u>https://www.cpuc.ca.gov/-/media/cpuc-website/divisions/energy-division/documents/integrated-resource-plan-and-long-term-procurement-plan-irp-ltpp/2024-2026-irp-cycle-events-and-materials/assumptions-for-the-2025-2026-tpp/25726-tpp-pd-resolve-and-servm-analysis-slide-deck.pdf</u>

## Modeled Potential Locations for Future Clean Energy Resources for Transmission Planning

2025-26 TPP Base Case Portfolio (2040) Busbar Mapping Results

CPUC transmits IRP resource portfolios to the CAISO for use in its annual Transmission Planning Process (TPP) to identify future transmission needs.

## **APPENDIX**

California Public Utilities Commission

### New MWs Expected - Nameplate By Year and Resource Type, including imports

Resource Type	2025	2026	2027	2028	Total
Solar	1,057	1,345	322	150	2,874
Battery Storage	3,468	3,399	3,789	890	11,546
Paired/Hybrid	765	1,085	1,209	70	3,129
Wind	71	1,435	250	0	1,756
Geothermal	10	126	163	435	734
Biomass/Biogas	10	0	0	0	10
Totals	5,381	7,389	5,732	1,545	20,048

Data includes projects expected/under contract as of February 13, 2025

- Over 20,000 MW nameplate of future contracts are expected to meet CPUC's procurement order obligations.
- Majority of new resource MWs are expected to be battery storage.
- Other types of resources are eligible to meet orders and may be contracted in the future.

## **CAISO Resource Development By Location**

Data includes projects online as of April 9, 2025

County/State	2020	2021	2022	2023	2024	2025	Total Nameplate MW	Number of Projects

CALIFORNIA DEPARTMENT OF WATER RESOURCES

## 2024 Flexibility based on 3-7 Day Communication

## Renewable Resources Deployment Emerging Trends

CEC | Summer Energy Reliability Workshop 05.02.2025

### **Tracking Energy Development (TED) Task Force**

- Joint inter-agency working group to provide project development support for new energy projects
- Tracks project under development and those expecting to come online in the near-term
- Collect and synthesize information on project issues and challenges that may impact timely deployment
- Coordinate actions to address barriers, where applicable

### **Tracking Project Issues and Challenges**

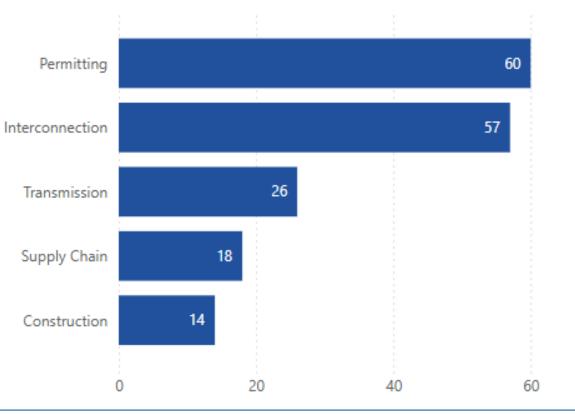

- GO-Biz Energy Unit tracking began in late 2022
- Set up a system for tracking engagement with developers and projects issues
- Synthesize data
- Work with TED Task Force member agencies to improve data collection

### **Tracking Project Issues and Challenges**

#### **Currently Tracking**

- **123** Total Active Projects
  - $\rightarrow$  52,000 MW
  - $\rightarrow$  53 with COD delays
  - $\rightarrow$  26-month avg. delay/project
  - $\rightarrow$  175 reasons cited for delay

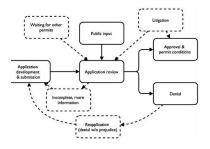

#### Summary of Top Reasons for Delay

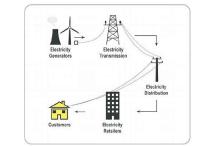

### **Challenges to Energy Project Deployment**

#### Main Reasons for Delay

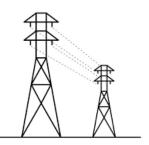

#### PERMITTING

- Local, state and/or federal
- Environmental reviews
- Staffing capacity/turnover
- Community opposition

#### INTERCONNECTION

- Documentation delays
- Easement issues
- Studies

#### TRANSMISSION

- Network upgrades
- Circuit breaker procurement
- Deliverability (queue management)
- Study issues

#### SUPPLY CHAIN

- UFLPA
- Global competition
- Very long lead time for circuit breakers and transformers

### **Battery Storage Safety Concerns & Challenges**

#### **Concerns/Challenges**

- Fire safety risks
- Environmental concerns
- Evolving technology
- Lack of permitting know-how
- Moratoriums

Fifth Standard Project in Fresno County

#### **State Activities to Date**

- Convening of the Battery Storage Collaborative
- CPUC General Order 167-C
- CPUC Data Request & Inspection
- CEC Roundtable with Stakeholders
- CEC Inspection (of it's jurisdictional plants)
- GO-Biz BESS Webinar & Upcoming Permitting Playbook
- Upcoming OSFM Battery Safety Symposium in July

### **Addressing Barriers & Challenges**

#### **Additional State Actions**

- CEC Opt-In Program
- SB 149 | Judicial Streamlining
- CPUC GO 131 E | Transmission Permitting Process Streamlining
- CAISO Interconnection Process Enhancement (IPE) Process
- Energy Infrastructure Strike Team
- CERIP | GO-Biz Renewable Energy Project Permitting Playbook

### **GO-Biz Renewable Energy Permitting Initiative**

#### **OBJECTIVE** | Renewable Energy Project Permitting Playbook

 Produce documentation to increase transparency and alignment of <u>local jurisdiction</u> permitting processes to reduce barriers for deployment of energy projects

#### **KEY RESULTS** | Assessment Report and Toolkit

- Report on the barriers to deployment for large renewable energy generation projects
- Develop resources toolkit that would include:
  - ➤ smart practices
  - > approaches to undertake to improve processes
  - > strategies that enhances connectivity b/w responsible entities

### **Approach to Developing Report & Toolkit**

### **CONTACT INFO**

Rohimah Moly Deputy Director, Energy & Climate Unit Governor's Office of Business & Economic Development rohimah.moly@gobiz.ca.gov

## **Energy Situational Awareness Dashboards**

Summer Energy Reliability Workshop

- Data is collected through regulations, legislation, rule-makings.
  - Quarterly Fuel and Energy Reporting (QFER), California Code of Regulations, Title 20, Ch.3, Article 1.
  - Power Source Disclosure (PSD) program, established by Senate Bill (SB) 1305 (Stats. 1997, ch. 796).
- External data leveraged from authoritative sources.
  - California Independent System Operator (CAISO).
  - U.S. Energy Information Administration (EIA).
- Dashboards convey key metrics in a userfriendly tool.
- Data is updated on specified intervals.

#### **California Electricity Consumption** Year ¥ . Consumption Summary (GWh) (Multiple values) • Agency Name F Sector Southern California Edison Residential 116,733 Agency Type Company Investor owned utility Commercial 114,975 111.629 Pacific Gas and Electric Residential Company 106.272 Agency Name Commercial (All) • 30,054 San Diego Gas and Electric Commercial Company 23.282 Residential Planning Area 1,567 PacifiCorp Residential (All) • 761 Commercial 1,187 Liberty Utilities Residential Sector 839 Commercial (Multiple values) • 342 Bear Valley Electric Service Residential 0K 20K 40K 60K 80K 100K 120K 140K Sector GWh 📻 Residential Commercial Consumption by Sector (GWh) **Total Electricity** 250K-200K-GWh 150K-100K-• 50K-0K 2017 2020 993 999 2002 2005 2014 066 2008 2011 •

- User friendly graphs and charts.
- Dynamic interaction.
- Data filters.
  - ≻Year
  - ≻Location
  - ≻Type
  - ≻Name/ID
- Empowering the end user to create custom views.

# **Quarterly Fuel and Energy Report**

- The regulations under QFER provide for the collection of energy data relating to electric generation, control area exchanges, and natural gas processing and deliveries.
- The dashboards display information that includes gross generation, net generation, fuel use by fuel type for each generator, and total electricity consumed on site.

Quarterly Fuel and Energy Report (QFER) Data Tables (https://www.energy.ca.gov/datareports/energy-almanac/california-electricitydata/quarterly-fuel-and-energy-report-qfer-data)

## **Panel: Summer Reliability Assessments – Electricity**

Moderator: Liz Gill

- A. CEC Stack Analysis, Chie Hong Yee Yang, CEC
- B. Stack Analysis for CPUC Resource Adequacy Proceeding, Elijah Cohen, CPUC
- C. Summer Loads and Resources Assessment, Aditya Jayam Prabhakar, California ISO
- D. 2026 CPUC Resource Adequacy Planning Reserve Margin Study, Behdad Kiani, CPUC
- E. Long-Term Loss of Load Expectation Analysis, Hannah Craig, CEC

## **2025 Summer Stack Analysis**

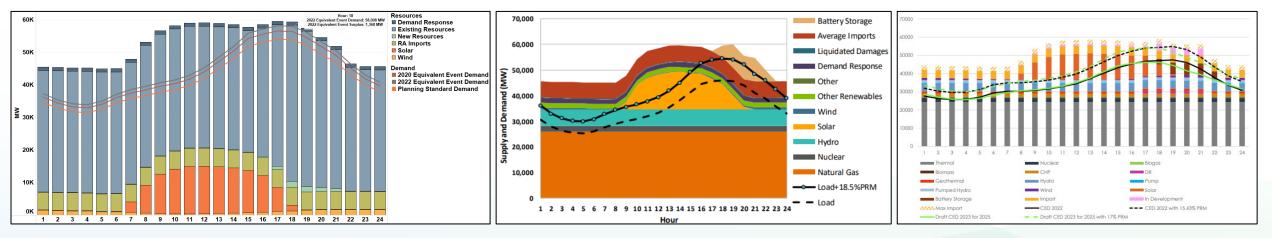

Summer Energy Reliability Workshop

Chie Hong Yee Yang, CEC

# What is a stack analysis?

- Visual and analytical tool that compares available generation capacity with forecasted electrical demand
- Identifies potential reliability gaps when demand exceeds supply
- Critical for reliability planning, resource adequacy, and contingency resource planning

Source: CEC

Source: California ISO

Source: CPUC

# **CEC Summer Stack Analysis**

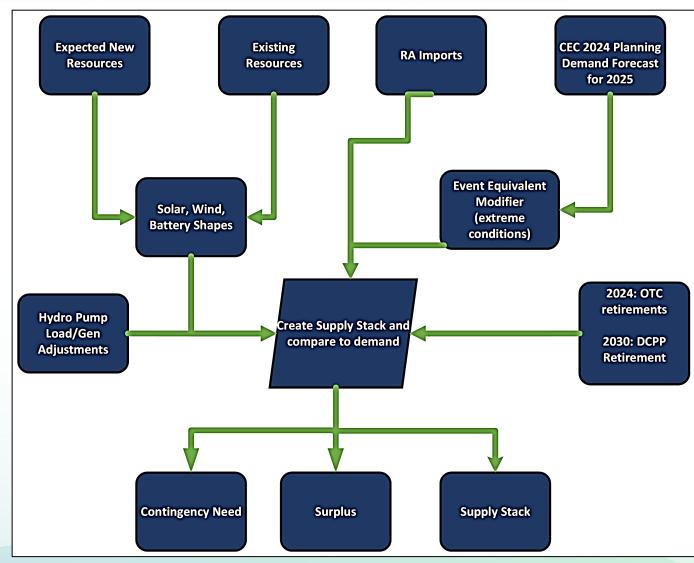

#### **Purpose:**

- Deterministic approach
- Assess average and extreme conditions
- Inform need for contingencies

#### **Considers extreme conditions:**

- High demand days like summer 2020 and 2022
- Increased levels of unplanned outages
- Coincident Fire Risk

#### Stack analysis is updated throughout the summer and as new information becomes available

Source: CEC

Condition Relative to 1-in-2 Forecast	Operating Reserves	Outages	Demand Variability	Coincidental Fire Risk	Notes
Average Conditions: Current RA Planning Standard – 17%	6%	5%	6%	4,000 MW	17% beginning 2024
2020 Equivalent Event: Additional capacity needed to ride-through heat event like 2020	6%	7.5%	9%	4,000 MW	9% higher demand over median, and 2.5% higher levels of outages
<b>2022 Equivalent</b> <b>Event:</b> Additional capacity needed to ride-through heat event like 2022	6%	7.5%	12.5%	4,000 MW	12.5% higher demand over median, and 2.5% higher levels of outages

	Total	4859	4437	4551		

<sup>1</sup> Estimates based on current enrollment and projected growth

<sup>2</sup> Nine projects were recommended for DEBA funding for a total of 297 MW. Includes 9.5 MW anticipated to be online in 2026 and ~287 MW online in 2027.

<sup>3</sup> Based on enrollment numbers and average per customer ex ante load reduction from filing year 2025 Load Impact Protocols \* Numbers are from 2024 IOU Excess Reports. Numbers will be updated for summer 2025 when IOUs submit their June 2025 Month-Ahead Showings to CPUC

## **Thank You!**

#### 2025 CPUC Stack Analysis July, August, and September

Elijah Cohen Analyst, Electric Market Design CPUC Energy Division May 2, 2025

California Public Utilities Commission

### CPUC Slice Of Day (SOD) RA Compliance

- CPUC's Slice of Day RA Framework became binding for compliance year 2025 pursuant to D.24-06-004.
- LSEs are required to make Year-ahead and Month-Ahead RA showing that demonstrate they meet a <u>24-hour</u> worst day need obligation, as opposed to a single net peak value. They must also demonstrate that they have enough charging capacity to charge their storage resources. The 24-hour monthly need is based on individual adjusted LSE load forecast benchmarked to the 2023 hourly CED IEPR vintage (for load forecast year 2025) plus a 17% planning reserve margin.
- Implementation of SOD:
  - Master Resource Database ((MRD) Used for validating resource supply across 24 hour.
  - SOD Template Tool used by LSEs to show compliance to CPUC.
  - SOD Validation Tool Tool used by ED to validate LSEs showings. Pulls from MRD and CAISO supply plan data.
- SOD Filings to-date
  - Year Ahead- filings submitted October 31, 2024
  - Month Ahead- filings have been submitted for compliance months January June 2025. July MA filings due on 5/17
  - Non-binding Summer RA Filings- LSEs have also filed non-binding RA SOD filings for July-September that CPUC is currently analyzing

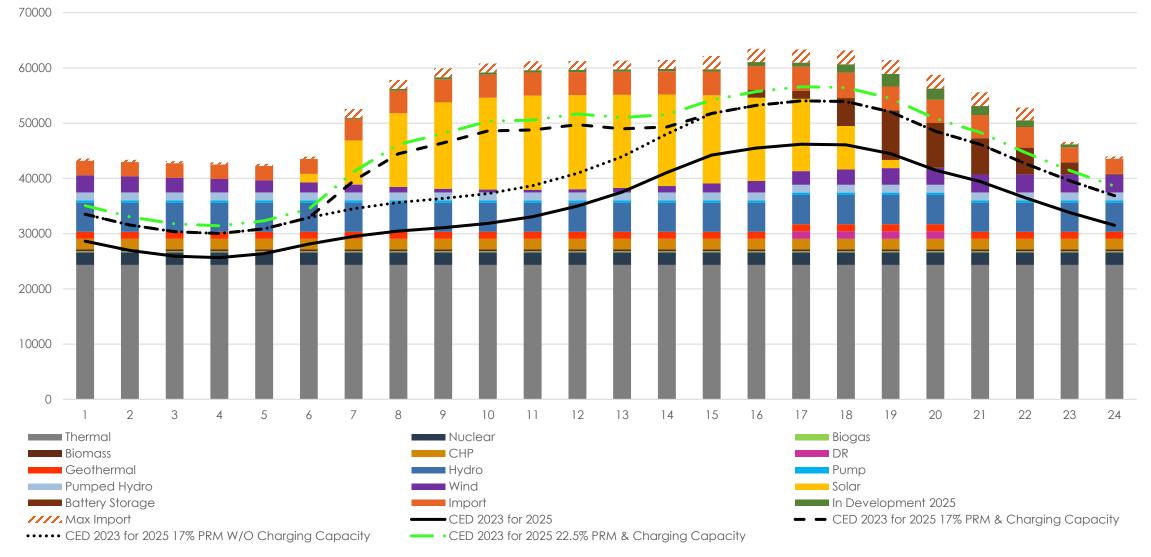

#### **Background and Assumptions**

Supply	Key Assumptions
Imports	Includes a conservative value representing minimum historical imports ("Import"- represented in solid orange) and a more optimistic value representing maximum historical imports ("Max Import"- represented in dashed orange). Sources are CAISO Supply Plans and CPUC Month Ahead filings.
Under Construction	Data sourced from IRP filings gathered in October 2024. Staff applied a 40% reduction to the Under Construction (UC) resources to represent potential construction delays. These resources are represented in dark green in the supply stack.
Existing Physical Resource	Data sourced from the CPUC Master Resource Database (vintage October 2024) represent physical resource supply in CAISO BAA. This MRD utilizes resource specific exceedance profiles and technology factors. Note: No SRR OTC plants were included in supply stack.
Batteries	Profiles from the CPUC PRM LOLE study were used to create battery shapes. Additional analysis adjusted batteries to achieve equal supply margins over evening hours (HE17-24).
Demand	Key Assumptions
Load Forecast	2023 CEC IEPR managed demand forecast (system planning scenario) for RA year 2025 (July, August, and September). Demand forecast is represented by the black line which reflects the peak day (worst day) hourly shape. This includes both CPUC-jurisdictional and non-jurisdictional LRAs.
Planning Reserve Margin	17%, which is the CPUC jurisdictional PRM. The dotted black line reflects hourly RA capacity needs (hourly load + 17% PRM). The dashed black line represents the hourly RA capacity needs plus the excess capacity required to charge the storage resources. There is also a dashed green line representing a 22.5% PRM, which a more extreme scenario that the CEC uses that matches a 2020 weather event.

## **2025 Summer Stacks**

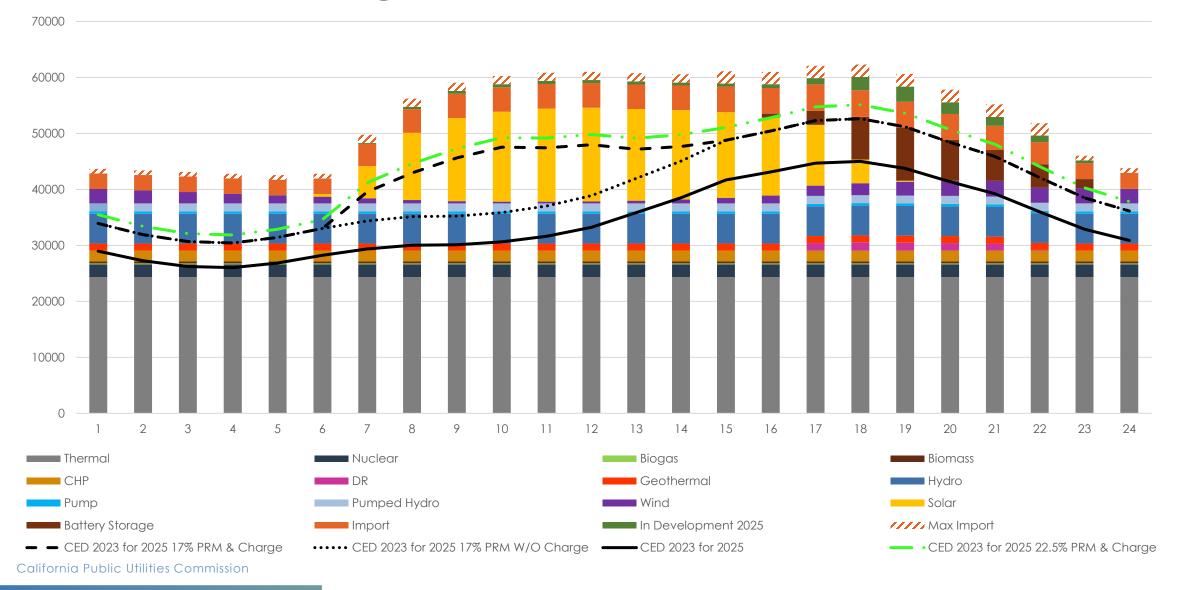

California Public Utilities Commission

#### Slice of Day July 2025 Stack

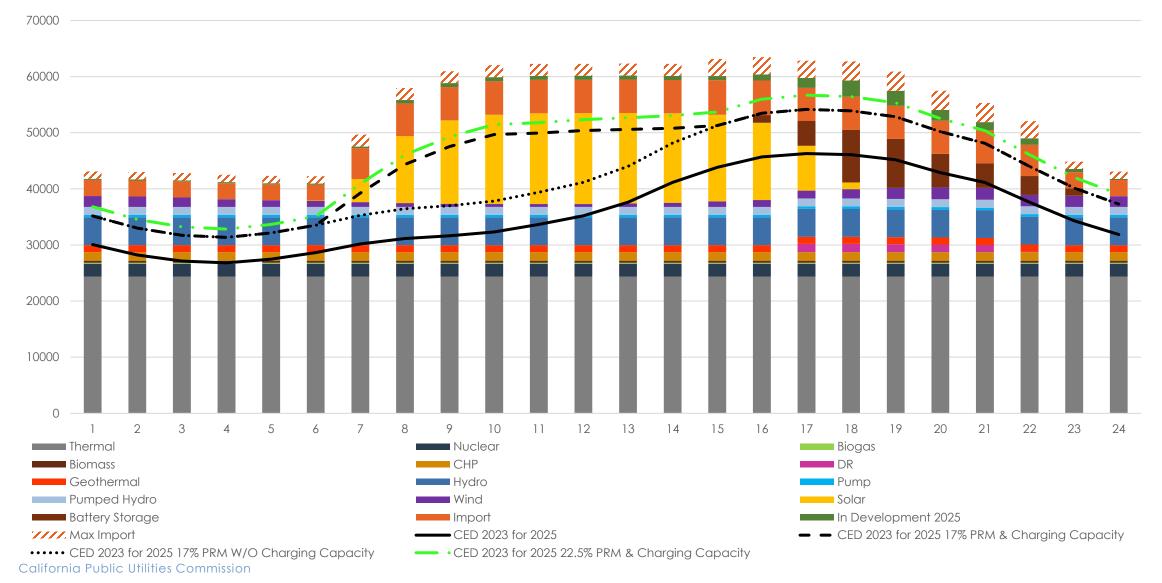

California Public Utilities Commission

#### Slice of Day August 2025 Stack

#### Slice of Day September 2025 Stack

#### Supply Margin Summary by Month

HE 23 (10-11 PM)	July	August	September
17% PRM with Conservative Imports	6,586 MW	6,723 MW	3,381 MW
17% PRM with Max Imports	6,993 MW	7,541 MW	4,696 MW
22.5% PRM with Conservative Imports	4,725 MW	4,914 MW	1,493 MW
22.5% PRM with Max Imports	5,132 MW	5,733 MW	2,808 MW

• Under a range of assumptions, all 2025 summer months show installed capacity length relative to RA program obligations

#### Staff Observations on 2025 Supply Margin Analysis

- Imports: HE 23-24 historically has fewer planned imports than other evening hours (Max Imports in September are only 4200 MW for those hours, in July/August: 3100/3600), due to most imports being MCC bucket 3 (7 AM – 10 PM, 6 days per week). This is does not reflect actual import flows, but firm capacity contracts.
- Late Evening Hours: Stacks often assume battery profiles that fully discharge by 10 PM. Using this assumption, HE23-HE24 becoming more constrained, requiring batteries to spread discharge until then, rather than discharging at Pmax over four hours. Other hours are more constrained without batteries.
- <u>Batteries</u>: If battery profiles are adjusted to make supply margins equal across hours, then the equalized supply margin with a conservative import assumption across evening hours would be 4783 MW (Sep), 7313 MW (Aug), and 7120 (Jul). As evenings get hotter, batteries should retain charge up until later hours.

## California Public Utilities Commission

Elijah.cohen@Cpuc.ca.gov

#### 2025 Summer Loads and Resources Assessment

Aditya Jayam Prabhakar

Director, Resource Assessment and Planning

May 5, 2025

CAISO Public

#### 2025 Summer Outlook: resources, loads, and weather

#### **Resource Additions**

- Capacity added from September 1<sup>st</sup> through December 31<sup>st</sup>, 2024:
   2,478 MW
- Capacity added from January 1<sup>st</sup> through April 1<sup>st</sup>, 2025: 894 MW
- Capacity expected from April 1<sup>st</sup> through June 30<sup>th</sup>, 2025: 2,163 MW

#### Load Forecast

 September peak load forecast:
 46,094 MW, HE 18 (from 2024 California Energy Commission's Integrated Energy Policy Report)

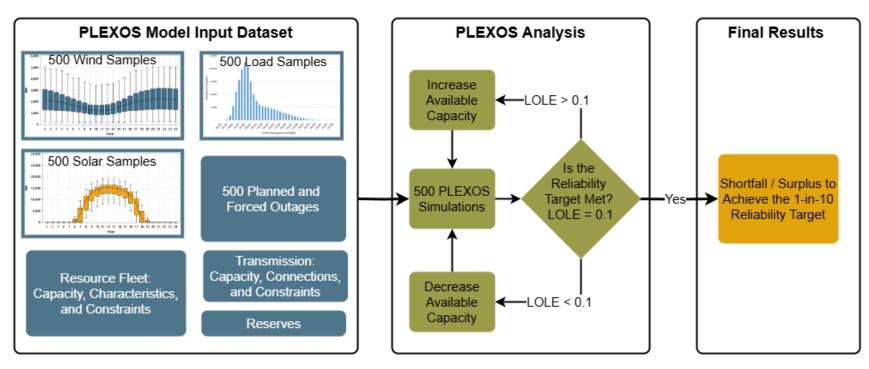

#### **Weather Outlook**

- Above normal temperatures are likely June through August
- Increased chance of heat events in June and July across the West
- Average hydro conditions

The CAISO conducted a probabilistic assessment to evaluate the sufficiency of the anticipated 2025 summer fleet to meet the 1-in-10 LOLE planning target

Loss of load expectation (LOLE) is a measure of the number of days per year for which the available generation capacity is insufficient to serve the demand at least once during that day. 0.1 LOLE or 1-day-in-10 LOLE equates to "1 day with an event in 10 years".

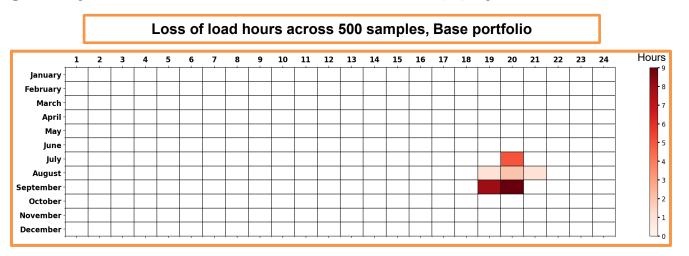

PLEXOS is an energy market simulation engine.

**CAISO** Public

The CAISO's probabilistic assessment concludes that the portfolio meets planning performance targets, yielding a surplus of 1,451 MW

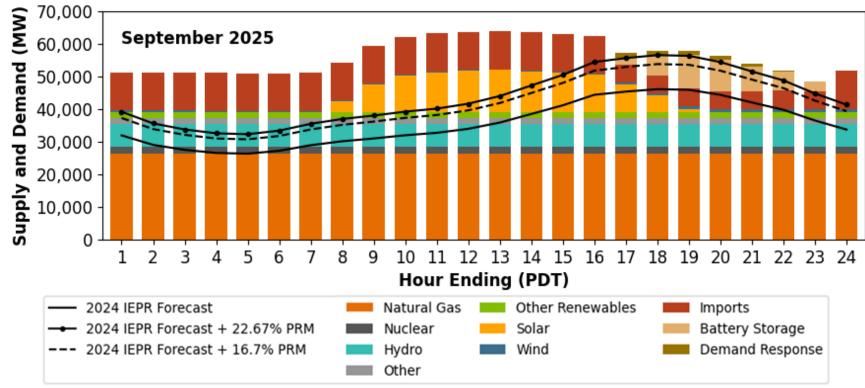

This assessment evaluates the likelihood of needing emergency measures to balance supply and demand.

This assessment takes into account reasonable historical trends and data, but does not consider extreme or emergency events.

# The CAISO's multi-hour stack analysis also indicates a reasonable margin above the PRM required to achieve a 0.1 LOLE

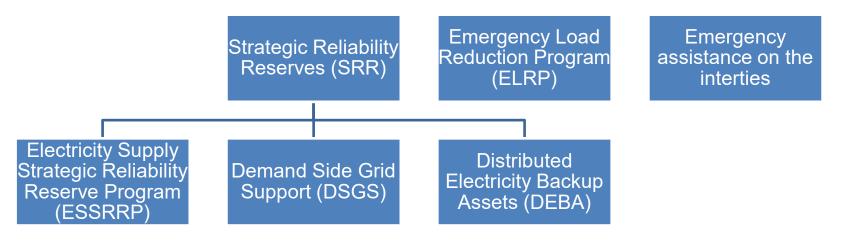

A Planning Reserve Margin (PRM) of **22.67 percent is required to meet a 0.1 LOLE**, calculated by first subtracting the surplus capacity of 1,451 MW (as determined in the probabilistic study) from all available resources.

The load-weighted average PRM across all LSEs for the 2025 RA year, which reflects LRA-established requirements, is 16.7 percent.

State reliability reserves and coordination with neighbors support reliability during extreme events

- Extreme drought, wildfires, and the potential for widespread heat events continue to pose risks to the CAISO grid
- To safeguard against these extremes, strategic reserves and state emergency programs have been mobilized and remain available in 2025

## 2026 CPUC Resource Adequacy Planning Reserve Margin Study

Behdad Kiani, PhD Senior Analyst, Energy Resource Modeling CPUC Energy Division May 2, 2025

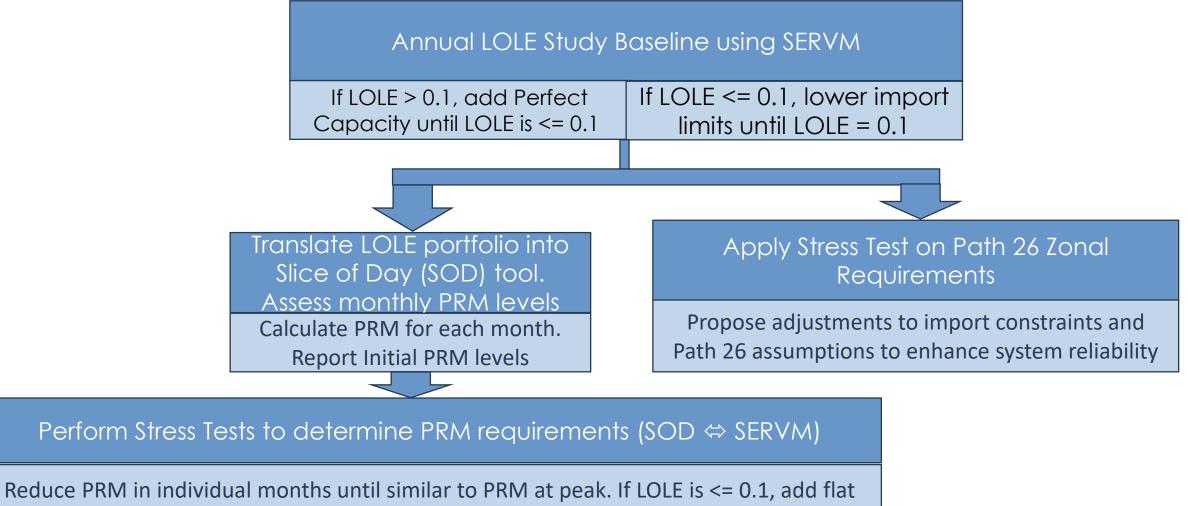

#### Summary/Outline of Presentation

- Loss of Load Expectation (LOLE) Study Methodology and Key Assumptions and Stress Test
- LOLE Study Results
- Planning Reserve Margin (PRM) Calibration Results

#### CEC – CPUC – SOD Framework and Challenges

- IEPR Single Forecast Set (SFS) 1-in-2 consumption specifies forecast year magnitude (peak and mean)
- CPUC consumption weather years tuned distribution of weather years so median matches IEPR 1 in 2 managed forecast
- SERVM used to determine Total Reliability Need (TRN) portfolio which satisfies 0.1 LOLE
- Slice of Day tool (SOD) Inputs:
  - TRN portfolio
  - IEPR SFS 1-in-2 sales strip
- Ideally IEPR SFS and CPUC 1-in-2 consumption and sales forecasts should align
  - All demand modifiers are nominally identical
  - However, disparities between IEPR SFS and CPUC stochastic approach can lead to inconsistencies
    - May not be possible to tune to both consumption and sales

#### **Review of Overall Study Methodology**

blocks of demand until LOLE is above 0. If LOLE is > 0.1 reduce demand blocks until solve for 0.1 LOLE – an iteration between LOLE model and Slice of Day tool

California Public Utilities Commission

#### Modeling Approach and Key Assumption

•Energy Division issued an Inputs and Assumptions document in March 2024 documenting process for performing LOLE study and translating to the SOD PRM Calibration Tool. Parties were given opportunity to comment on the assumptions and methods.

•Staff Modeled Existing Resource Fleet Plus Known Planned Resources (Resource under development expected to be online June 1, 2026). Import constraint was initially set at 4,000 MW. No LOLE surfaced

Modeling Criteria	Description
Import Assumption	To surface LOLE Staff used the import constraint as a lever
Stress Test	Added to ensure reliability criteria is being met across all months
PRM Calibration	LOLE study results converted to Slice of Day (SOD) accounting using a calibration SOD tool to produce monthly PRM levels
Planned Outages	Removed from portfolio to reflect current planned outage framework used for RA

Note: This approach was previewed in the IRP Inputs and Assumptions doc published in March 2024 California Public Utilities Commission

#### Updated Baseline: Existing and In-Development Resources

- Existing (online) units refreshed from CAISO Master Generating Capability List January 2024
- In-development resources drawn from contracted projects reported by LSEs in their December 1, 2023, IRP Filings
- CAISO will be able to rely on, for reliability purposes, the large amounts of storage, solar, and hybrid projects that are under development as of January 2024 and projected to be online by August 2026
  - In-development projects total about 80 units, with total nameplate about 9.4 GW, comprising about 9.8% of the total Baseline nameplate MW - and the majority of these projects are online or close to being online

# Summary of Revised LOLE 2026 RA Study Results (Released Jan. 2025)

- Staff found that the baseline resource fleet was over reliable. In order to surface Loss of Load, staff reduced imports assumption to just 1,700MW. This avoided the need to retire individual power plants in the model to surface LOLE.
- When performing the monthly SOD stress tests, overall PRM levels of 20% for the months of October through March and 21% for June through October allow for reliable operation of the CAISO system by raising the import constraint back up to 2,500 MW.
- Staff are comfortable combining April and May with the off-peak months and maintaining PRM of 20% in these off-peak months as it is expected CAISO can manage these off-peak months with dispatch and operational actions.

# Initial Monthly Modeled SOD PRM for the most constraint hour in Sep. resulting from Annual LOLE Portfolio

- September Hour Ending 18 is the month+hour the model shows has the most constrained PRM
- Initial model focuses only on summer months achieving 0.1 LOLE and other months showing 0 LOLE due to extra resources resulting in higher PRM numbers

Califormia Public Utilities Commission

Month	PRM	Most Constrained Hour Ending	Managed Load (MW)	Availabl e Supply (MW)

#### Appendix (extra slides)

## Recalculating PRM using the 'old' methodology for 2026 RA LOLE Study

California Public Utilities Commission

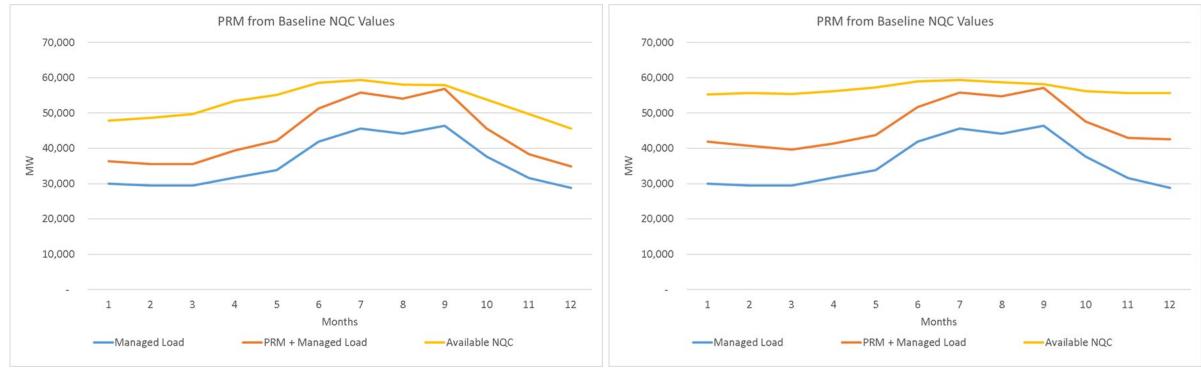

# Overview of analysis – recreating PRM from managed peak and ELCC/NQC

- The monthly PRM were calculated by using ELCC (Effective Load Carrying Capability) instead of exceedance for solar and wind resources.
- This is compared to the monthly peak demand, rather than the most constrained monthly hour that is used in SOD tool
- Monthly NQC values of total resources were divided to managed load to calculate the monthly PRM
- staff observe that the modeled PRM requirement percentages mostly match between methods through summer months.
- However, higher modeled PRM requirement levels are seen during the winter months since ELCC values are higher than exceedance capacity values in winter months.

#### Comparison of Revised SOD results with the "old method" stress test from SERVM – increase in NQC in offpeak months

PRM calculated from SOD PRM-setting tool using

exceedance

PRM calculated from non-SOD ELCC Stress Tests

## **CEC 2025-40 Probabilistic Reliability Analysis**

Summer Energy Reliability Workshop

Hannah Craig, CEC

# Probabilistic Reliability Analysis

• Industry standard: Used to set and measure against resource adequacy metrics

 Probabilistic: Hundreds to thousands of production cost model simulations drawing weather years and outages

 Primary metric: No more than one day with loss of load in 10 years

# **CEC Reliability Model Basics**

- Model: Stochastic model in PLEXOS 9.2
- Sampling: 408 samples
  - 17 weather years from 2007-2023.
    - NREL solar and wind profiles calibrated to CAISO generation data.
    - Load profiles based on the 2024 IEPR California Energy Demand Forecast
  - 24 outage samples, using forced outage data from GADS.
- Metric: 1 day of loss of load for every 10 years sampled.
- Interval: Results reported 2025-2040 for every five years.

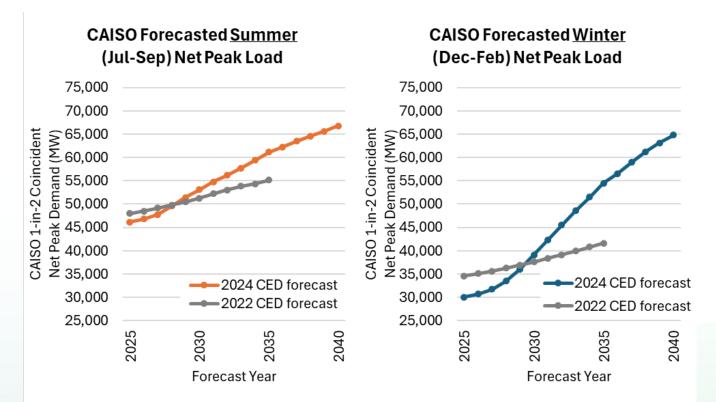

- California Centric Model: CA power plants but does not model WECC.
- New Resource Portfolio:
  - CPUC Preferred System Plan adopted in February 2023.
  - Non-CAISO expansion based on utility plans.
- Results reported statewide

#### Cumulative Statewide Capacity (GW)

- Forecast vintage: 2024 IEPR CED
- Stochastic profiles developed through regression weather year analysis
- Load modifiers from the 2024 CED added and do not vary by weather

- CAISO Import Limit: 5,500 MW
- Statewide Import Limit: 12,450 MW in all hours
- Three Import Scenarios:
  - Base case limits flows into CAISO during summer evening peak
  - > Year-Round Peak scenario limits imports during morning and evening peaks year round
  - > No imports scenario allows no imports into CA, CAISO still limited at peak.

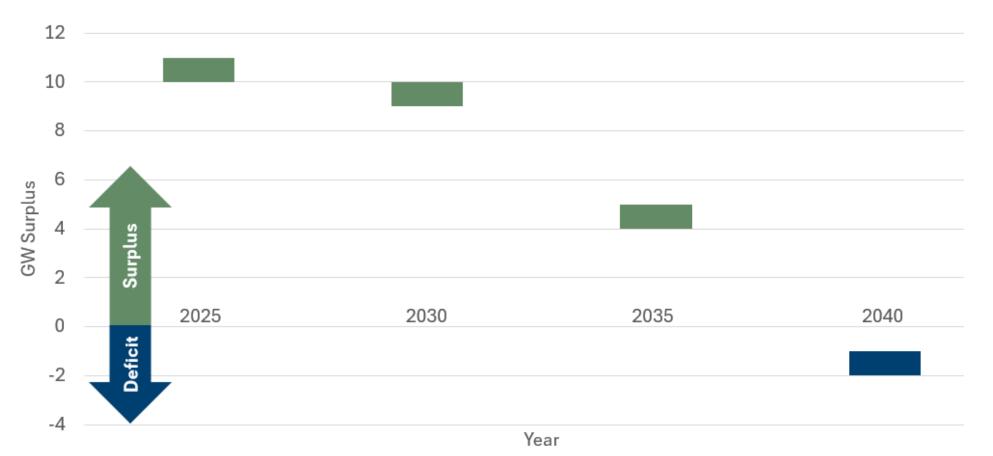

- **Base Case**: Determine whether planned resources are sufficient to meet reliability target under normal conditions.
- Stress Cases: Evaluate reliability under more conservative resource and import assumptions to determine vulnerability to risk factors.

Scenario	PSP	California Imports	CAISO Import Limit	Results	
Base Case	Full PSP	Yes	Summer Only	Surplus and LOLE	
Stress Case	40% Reductions in PSP	Yes	Summer Only	LOLE	
Stress Case	40% Reductions in PSP	Yes	Year-Round	LOLE	
Stress Case	40% Reductions in PSP	No	Summer Only	LOLE	
Stress Case	Full PSP	Yes	Year-Round	LOLE (Report Only)	
Stress Case	Full PSP	No	Summer Only	LOLE (Report Only)	

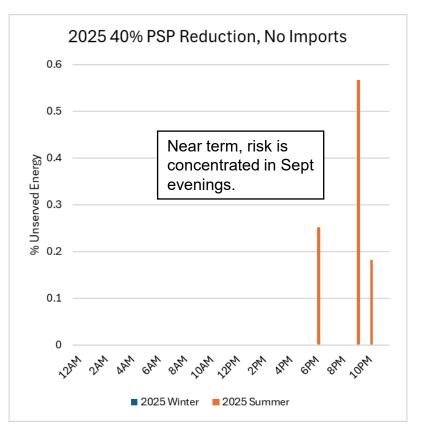

Full PSP buildout results surplus in the near-term assuming normal transmission conditions.

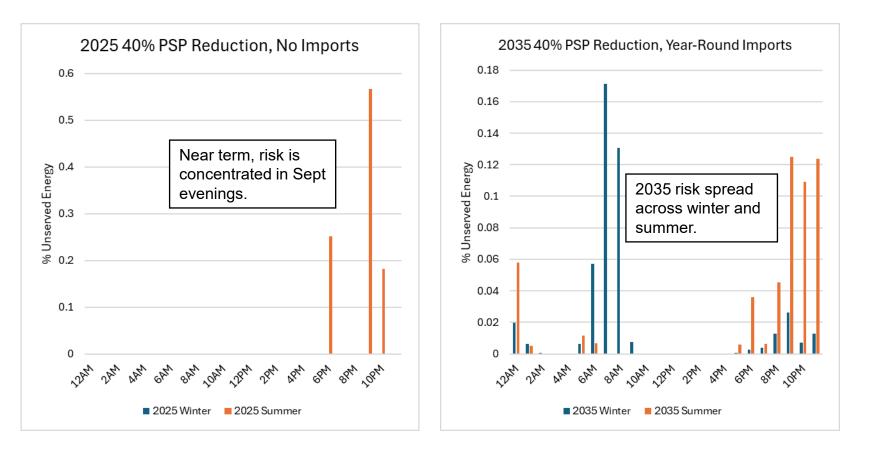

- Base case reliability analysis assumes full PSP comes online.
- System still reliable out to 2030 with 40% reduction in PSP resources.
- 2035 and 2040 show high levels of unserved energy with 40% reduction cases.

PSP	California	CAISO Import Limit	2025 LOLE	2030 LOLE	2035 LOLE	2040 LOLE
PSP	Imports		(days/year)	(days/year)	(days/year)	(days/year)
Full PSP (Base Case)	Yes	Summer Only	0	0	0	0.9
40% Reductions in PSP	Yes	Summer Only	0	0	0.79	10+
40% Reductions in PSP	Yes	Year-Round	0	0	2.64	10+
40% Reductions in PSP	No	Summer Only	0.003	0.17		

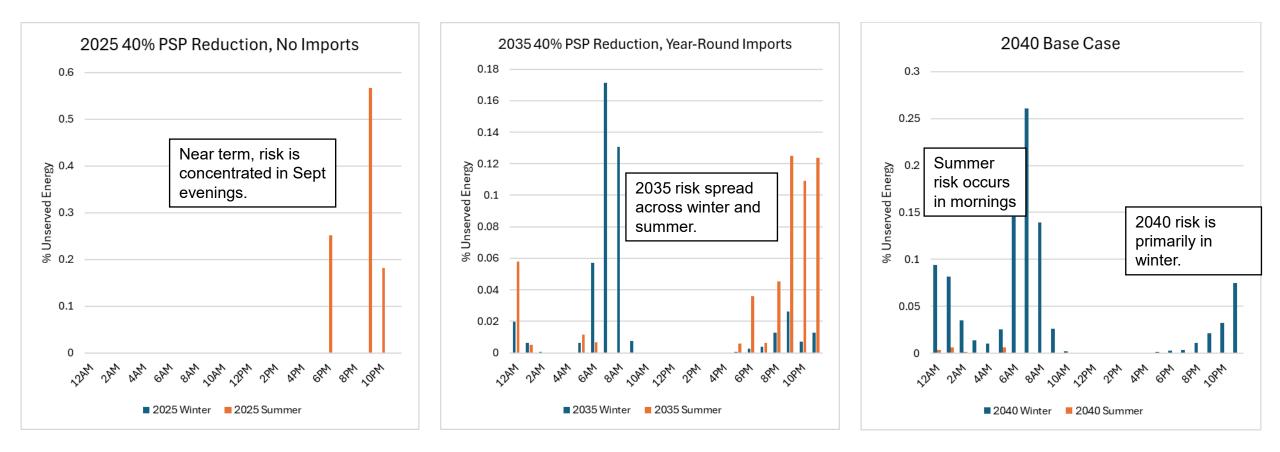

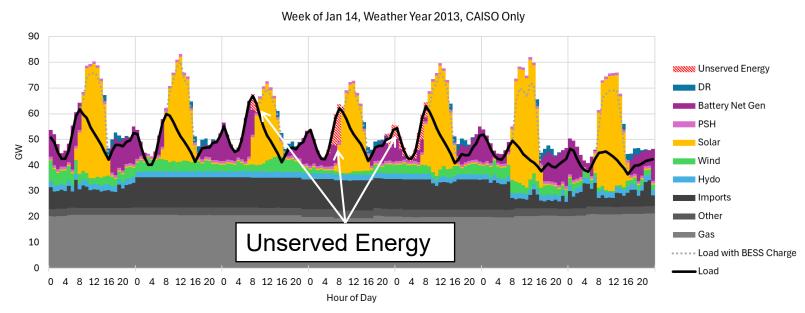

# Shifting Nature of Risk (2/3)

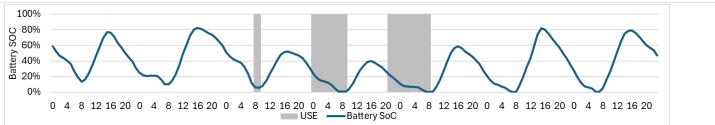

# Shifting Nature of Risk (3/3)

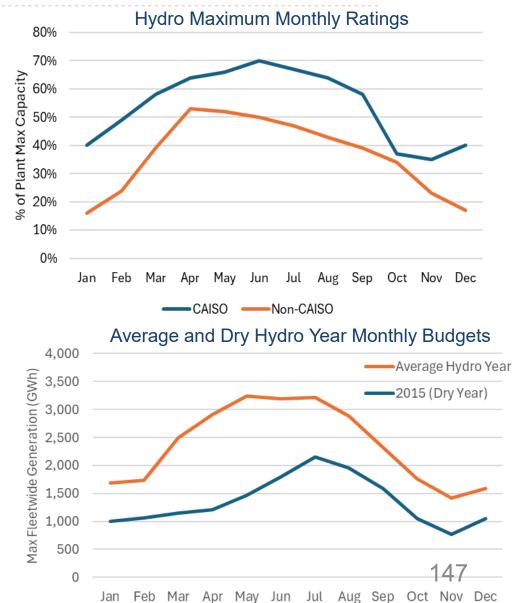

- Winter reliability risk in 2040 could look like:
  - Heavy rain reduces solar output.
  - Cold snap raises morning loads.
  - Batteries struggle to maintain charge.
  - Multiday risk due to cascading low battery charge.

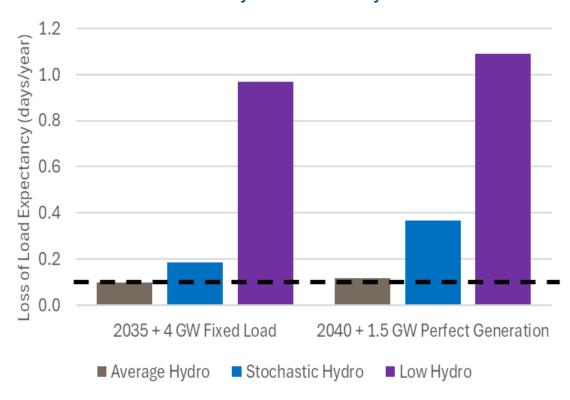

# **Stochastic Hydro Sensitivity**

- Question: Is using an average year hydro budget a valid approach given recent swings in hydro availability?
- Base Case: Average monthly budget for all samples.
- Stochastic Case: Varies hydro budget by sample
- Dry Hydro Case: 2015 hydro budget for all samples
- Max and Min ratings do not change.

# **Stochastic Hydro Results**

- Calibrated to a .1 LOLE to explore whether the current hydro modeling approach continues to be valid.
- The stochastic hydro year does show higher LOLE and the dry hydro year has a much bigger impact.
- Monthly maximum ratings are not affected, showing that the calibrated systems are energy-limited throughout the month.
- Historic monthly budgets and ratings may not be representative of a winter-peaking system.

#### Stochastic Hydro Sensitivity Results

- The system may have reliability surpluses in the near term if full PSP is built out, assuming normal transmission conditions.
- The increase in electrification forecast in 2035 and 2040 will shift reliability risk into winter mornings.
- Modeling assumptions based on historic data like imports and hydroelectric generation may no longer be predictive in a system with winter risk periods.

## Natural Gas Reliability Modeling Tools Stochastic Daily Mass Balance

Khaled Abdelaziz, PhD, PE

Natural Gas Modeling Lead

CPUC Energy Division

May 2, 2025

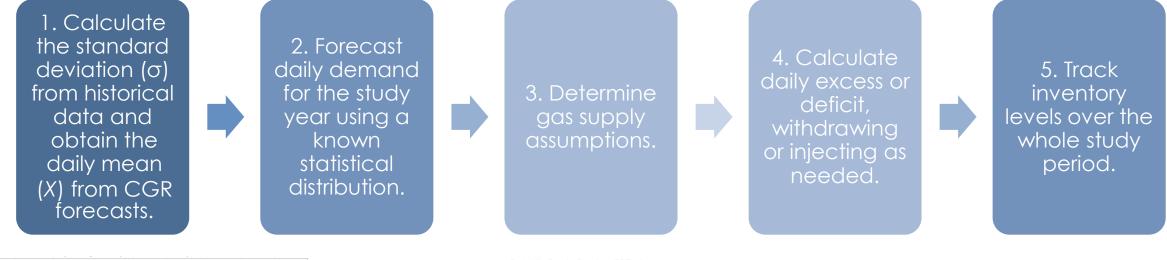

## **Presentation Outline**

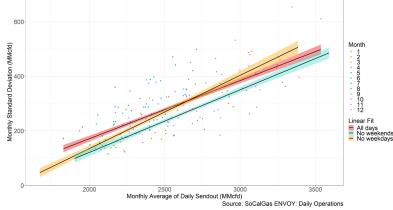

- Overview of Natural Gas Models Used by Energy Division
- Stochastic Daily Mass Balance Model
- Previous Use Cases
  - Summer 2024 Southern California Gas Reliability Assessment
  - The possibility of minimizing the use of Aliso Canyon
- Upcoming Use Case
  - 2025 Biennial Assessment of Aliso Canyon
- Model Strengths and Weaknesses
- Discussion

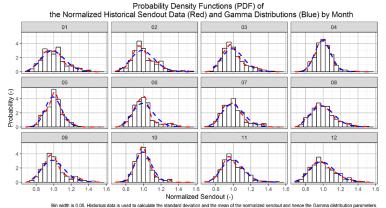

## Overview of Natural Gas Models Modeling Tools Used by Energy Division

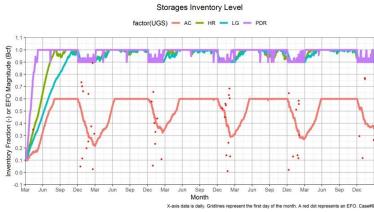

- Monthly Mass Balance
  - Simplest model (excel spreadsheet)
  - Conserves mass only on a monthly basis (using known monthly means)
  - Used widely to calculate <u>seasonal</u> storage needs
- Stochastic Daily Mass Balance Model
  - Conserves mass only on a daily basis (using random sampling)
  - Can model daily inventory, withdrawal, and injection capacities available
  - Can predict the number and size of imbalances during the winter season
  - Developed from scratch by Energy Division staff using R
- Synergi Gas (sub-hourly):
  - Conserves mass and momentum at each time step
  - Most detailed model, most computationally expensive, and laborious
  - Simulates the transmission network of the IOU (or more if desired)
  - Multi-state models do not exist

## Stochastic Daily Mass Balance Model Summary of Methodology

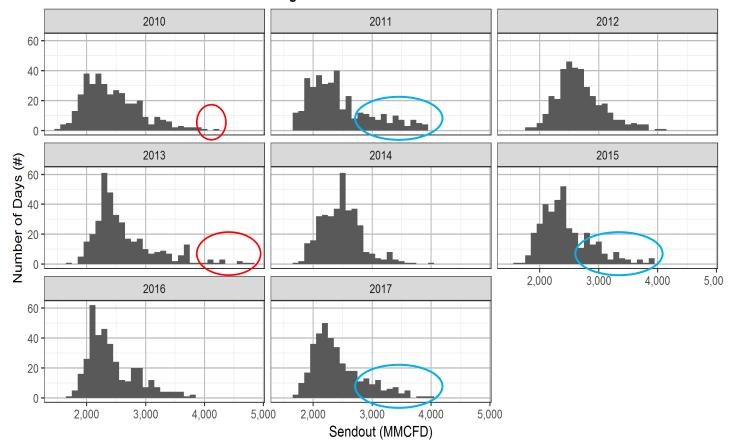

California Public Utilities Commission

## Historical Sendout by Year (2010-2017) Yearly Histograms are Right Skewed

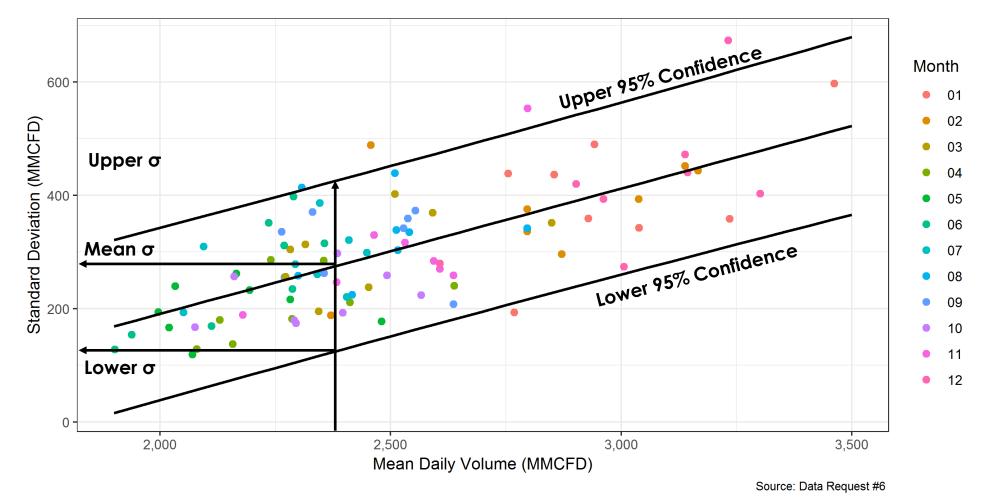

Monthly Histograms employ similar distribution, i.e., right skewed (Gamma Distribution) based on forecasts of mean and historical variability. Red outlines highlight high Sendout days.

Histograms of Historical Sendout Data

Bin width is 100MMCFD

## Standard Deviation vs. Mean Daily Volume Variability is Proportional to Monthly Means

## **Use Case**

Summer 2024 Southern California Gas Reliability Assessment

### Summer 2024 Southern California Gas Reliability Assessment: Supply Assumptions

• Assumed supplies are higher than the forecasted demand for all months and all scenarios.

	Supply Scenario			Demand	
	1	2	3	CGR 2022	CGR 2020
Month					
April	2,355	2,707	2,707	2,385	2,245
May	3,000	2,707	2,707	2,090	1,915
June	3,005	2,707	2,707	2,021	1,864
July	3,625	2,707	2,707	2,058	2,270
August	3,625	2,707	2,707	2,102	2,508
September	3,625	2,707	2,707	2,100	2,399
October	3,625	2,707	2,707	2,086	2,259
Average Daily	3,266	2,707	2,707	2,120	2,209
Total (Bcf)	699.68	579.30	579.30	453.59	472.75

L-4000 Hydrotest and L-3000 Remediation . 90% RPU

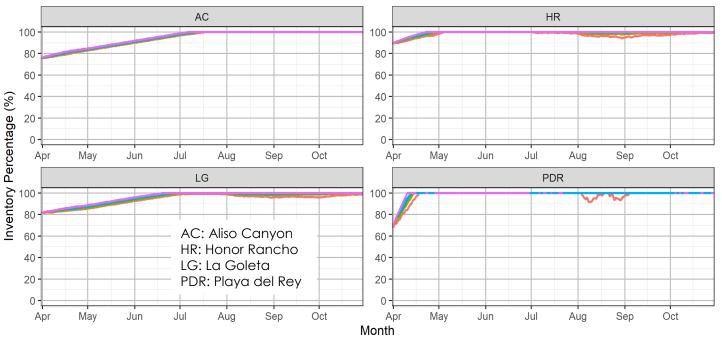

### Summer 2024 Reliability Assessment Inventory Tracking for Scenario 3

Storages Inventory Percentage (%)

Quantile — a.05th — a.25th — a.50th — a.75th — a.95th

• Summer 2024 is reliable as indicated by near-full inventory levels throughout the season.

 Seasonal assessment reports are published on the Aliso Canyon Oll Webpage around May and September.<sup>+</sup>

X-axis data is daily. Gridlines represent the first day of the month. Case#20240003

<sup>+</sup> https://www.cpuc.ca.gov/regulatory-services/safety/gas-safety-and-reliability-branch/aliso-canyon-wellfailure/aliso-canyon-summer-and-winter-reliability-assessments

## **Use Case**

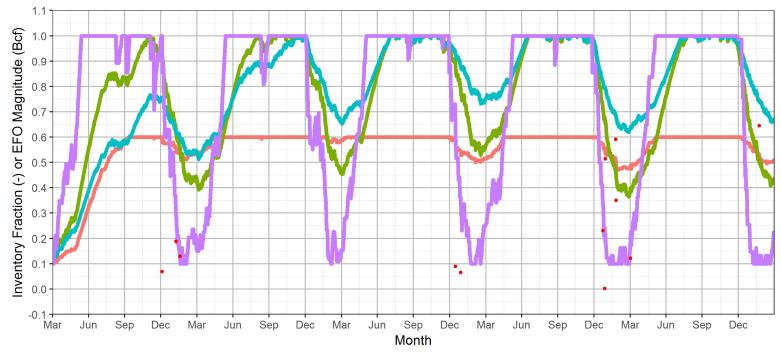

Aliso Canyon Proceeding OII-17-02-002 The Possibility of Eliminating or Minimizing the Use of Aliso Canyon First Biennial Assessment for 2025-2026 and 2030-2031

### Case 13: Aliso Allowed to 60%

Storages Inventory Level

factor(UGS) — AC — HR — LG — PDR

- Reducing Aliso Canyon allowed maximum to 60% increases the risk of curtailment.
- Red dots indicate days where demand could not be met.
- The first biennial assessment will be published on the Aliso Canyon Webpage and is expected in June 2025.<sup>+</sup>

X-axis data is daily. Gridlines represent the first day of the month. A red dot represents an EFO. Case#13

Cold year (1,594 HDD). Daily capacity of 3,000 MMscfd. Upper monthly standard deviation. 80% of wells are available year around. 10% minimum level for non-Aliso storage fields. 100% maximum level for non-Aliso fields. 60% maximum level for Aliso

### Stochastic Daily Mass Balance Model Weaknesses and Strengths

- 1. High gas prices could cause gas customers to use withdrawals from storage to manage costs as well as reliability, leading to higher withdrawals than forecasted.
- 2. A successful run of this model is **necessary** to meet the reliability standards but is **not sufficient** since the model does not conserve energy or model sub-daily events (i.e. peak hourly demand).
- 3. The daily mass balance introduces some stochasticity in natural gas modeling, which is much needed and reflects many uncertainties present in the natural gas system (outages, scheduling, customers' decisions, etc.)
- 4. This model also provides insight to the minimum storage inventory levels during the winter season.

# Thank you

Modesto Irrigation District, City of Redding, City of Roseville, Trinity Public Utilities District, City of Shasta Lake, and Sacramento Municipal Utility District

6001 S Street MS D109 Sacramento CA 95852-1830

# **Special Operating Scenarios**

- California Oregon Intertie (COI) derate due to the loss of two 500 kV lines under wildfire condition
  - Under 1-in-2 load condition, BANC would be in EEA 3 with potential risk of firm load shedding (This condition occurred in the past on 7/9/2021 with the Bootleg Fire.)
  - under 1-in-10 load condition, BANC would face significant risk of firm load shedding
- West-wide heatwave causing 1-in-20 load
  - BANC would be in EEA 3 with potential risk of firm load shedding under 1-in-20 load condition
- Solar reduction due to wildfire smoke
  - ✓ Smoke reduces BANC load more than Solar
- CAISO BA in Energy Emergency Alert 3 (EEA 3)
  - ✓ Minimal import reduction (1~4%)

#### BALANCING AUTHORITY OF NORTHERN CALIFORNIA

A JOINT POWERS AUTHORITY AMONG Modesto Irrigation District, City of Redding, City of Roseville, Trinity Public Utilities District, City of Shasta Lake, and Sacramento Municipal Utility District 6001 S Street MS D109 Sacramento CA 95852-1830

# Summary

- Slightly higher 1-in-2 and 1-in-10 load forecasts
- "Above Normal" water conditions
- 286 MW generation outages throughout the summer
- Sufficient Operating Margins for both 1-in-2 and 1-in-10 load conditions under base case analysis
- Slightly higher risk of load shedding compared with 2024 due to increased load forecast and extended generation outages.
  - Increased load shedding risk during conditions of COI outages, energy shortages and west-wide heatwave.
- BANC Power System Operators and the Operators from other BANC entities are having Summer Readiness Training to prepare for the summer operations.

### **Imperial Irrigation District**

2025 Summer Reliability Workshop

### Background

The Imperial Irrigation District (IID) was established in 1911 and entered the power business in 1936. Proudly serving Imperial and Coachella Valleys and a portion of San Diego County, IID has a service area of **6,471 square miles with over 165,000** residential and commercial customers.

193

### **Service Territory**

- Balancing Authority historic peak of 1,177MW in September 2024. That was a 2.2% increase over 2023.
  - 1,780-miles of transmission network and 5,004mile distribution lines.
- Connected Generation Capacity is over 2,200MW
- Diverse resource portfolio including: geothermal, solar, hydro, and emergency diesel resources
- Battery Storage
  - 30MW/20MWh El Centro
  - 30MW/120MWh Holtville

### **This Summer**

- 2025 summer load is projected to be slightly higher than last year's with peak forecast expected later in the summer
  - New IPP contract 42MW in IID BA
- New 230kV Cap Bank in the Coachella Valley

196

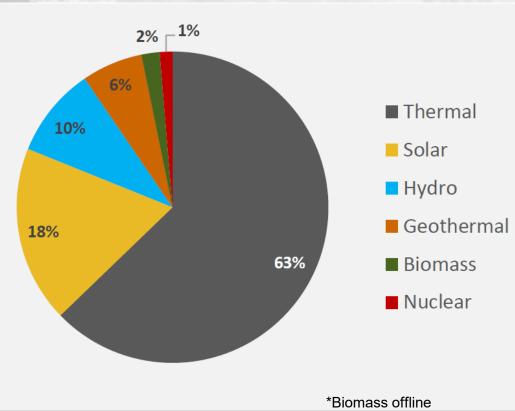

### **Generation Portfolio for 2025**

Over 165MW of distributed solar (roof top).

•

NW IID COM

Nameplate capacity of IID generation portfolio for 2025:

### **Current Energy Storage**

- 30MW/20MWh used for reliability:
  - Spinning Reserves
  - Automatic Generation Control
  - Voltage support
  - Frequency Response

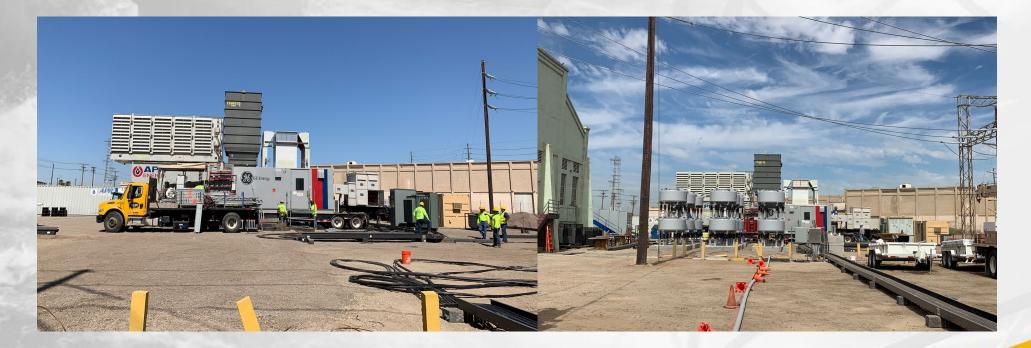

- 30MW/120MWh used for reliability:
  - Market Optimization
    - Negative Pricing
    - Solar Ramp Hours

### **Emergency Turbines**

- Three 20MW (60MW) of emergency diesel turbines at three distribution substations.
- 5 hour Max run time air permit.

### **Reserve Sharing Group**

- Increase in potential MW assistance based on WPP's methodology.
- More qualifying events under WPP's reserve sharing program.
- Allows for assistance request during EEA3

events.

# Summer Reliability Workshop LADWP

Tony Skourtas Manager of Energy Control Operations Energy Control and Grid Reliability Division

May 2, 2025

## Load Forecast

### All-time Peak

• 6278-MW August 31, 2017

(6502MW includes non-conforming)

- 2023 5226-MW August 29, 2023
- 2024 6266-MW September 6, 2024

### Load Forecast

	2017	2024
NPL	6278	6266
CC	102	110
LAX	93	105
Northridge	110	114

2025 Load Forecast Base 5575-MW 1 in 5 5974-MW 1 in 10 6183-MW 1 in 40 6505-MW

- OTC plants continue operation through 2029
  - Scattergood Unit 2
  - boiler re-tube completed, expect greater reliability
- Haynes Unit 1 & 2
  - Unit 1 due back mid-late July
  - Unit 2 due back in June (blades replaced)

Intermountain Power Project

- IPP Units 1 & 2 (Coal)
  - end of service ~ July/Aug (-1124 MW)
- IPP Units 3 & 4 (CC) "IPP Renewed"
   Commissioning underway ~ Aug/Sept (+529 MW)

Approx 600-MW Net decrease at IPP

## Renewables

- Wind Generation (no change from 2024)
  - Approximately 425-MW (excluding PPA's)
- Solar Generation
  - Adding 400-MW of PV
  - includes 300-MW BESS
- Total solar approximately 1520-MW

# Intermountain Power -600MW Eland 1 & 2 BESS +300MW Net Change at peak -300MW

## Transmission

- ✓ Barren Ridge Renewable Transmission Project
  - BAR-HSK 1 conductor upgrade complete Feb '25
- ✓ Rinaldi-Tarzana 1 upgrade complete Apr '25
- Sylmar Bank E (Path 41)
  - Out since Nov '22
  - Target date is July '26
  - 600-MVA 1290-MV

### Adequate Capacity, but...

dependent on

- 1. Actual Load/Temperatures
- 2. Successful commissioning of IPP and Solar/BESS
- 3. Procurement of additional imports if needed

- Reliability of older generating units
- Reliability of new generating units

> Wildfires

# **Public Comment**

### Zoom:

• Use the "raise hand" feature to make verbal comments

### **Telephone:**

- Dial \*9 to raise your hand
- \*6 to mute/unmute your phone line. You may also use the mute feature on your phone.

### When called upon:

- Your microphone will be opened
- Unmute your line
- Spell your name for the record, then start your comment.

Limited to 3 minutes per person and 1 representative per organization.

### **3-MINUTE TIMER**
