Action Items and Next Steps Mike Gravely, PUC	137			
Adjournment	139			
Certificate of Reporter				

1 PROCEEDINGS 2 DECEMBER 17, 2010 10:08 A.M. 3 MS. KOROSEC: All right, we're going to go ahead and 4 get started here. Good morning, I'm Suzanne Korosec. Т 5 manage the Energy Commission's Integrated Energy Policy 6 Report Unit. And welcome to today's Workshop on Smart Grid. 7 This workshop is being conducted jointly by the Energy 8 Commission's Integrated Energy Policy Report Committee and the PUC. Unfortunately, Commissioner Ryan from the PUC had 9 10 a last minute conflict and is unable to join us, but we will 11 be certain that her office receives a summary of the 12 workshop, along with the transcript of today's discussions. 13 This is the second in a series of workshops looking 14 at the technologies that are available to further 15 California's Energy Policy Goals and to reduce the impacts 16 on the California Grid of meeting those goals. On November 17 16th, we looked at energy storage and automated demand 18 response, and today we're looking at technologies that will 19 make the future smart grid work. These workshops are 20 informed by the Public Interest Energy Research, or PIER 21 Program, which assists the IEPR process by providing the 22 latest information on what technologies will influence 23 future policy. Today's workshop will help us understand how 24 the different key players, the investor-owned utilities, the

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

publicly-owned utilities, and the industry see the Smart
 Grid of the future and what technologies will have the most
 promise in helping California succeed.

Before we get started, I want to cover some 4 5 housekeeping items, give some brief context for how the 6 topic of Smart Grid has been covered in past IEPRs, and 7 provide a quick overview of today's agenda. For those of 8 you who may not have been here before, the restrooms are out 9 in the atrium through the double doors and to your left. We 10 do have a snack room on the second floor at the top of the 11 atrium stairs under the white awning, and if there's an 12 emergency and we need to evacuate the building, please 13 follow the staff out of the building into the park that is 14 diagonal to the building, and wait there until we're told 15 that it's safe to return. And remember to bring your 16 umbrellas.

Today's workshop is being broadcast through our WebEx conferencing system and parties need to be aware that we are recording the workshop. We will make an audio recording available on our website within a couple of days, and we'll make the written transcript available on the website in about two weeks.

23 The Smart Grid and the IEPR - the 2009 IEPR 24 discussed the crucial role of the Smart Grid in California's 25 future electricity system, particularly as the state California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

implements energy policy goals for increased energy
 efficiency and demand response, increased renewable
 resources to generate electricity, and also increased use of
 electric vehicles to displace petroleum use.

5 Smart Grid Technologies will also increase the 6 reliability of the electric grid by allowing grid operators 7 to better monitor grid performance and address problems more 8 quickly, which reduces the number of failures and faults, 9 and increases the efficiency and cost-effectiveness of the 10 Smart Grid will also provide new methods and Grid. 11 technologies to implement energy efficiency and demand 12 response through increased two-way communication, smarter 13 consumers, and products and tools that allow consumers to 14 make smarter energy decisions.

15 Smart Grid will also help integrate renewable 16 resources into the Grid through management of energy 17 storage, distributed generation, automated demand response, 18 and distribution level renewables, allowing the Grid to 19 accept much higher levels of renewable resources while 20 maintaining reliability. Smart Grid is also going to allow 21 the integration of high numbers of electric vehicles and 22 plug-in hybrids, without causing major disruptions on the 23 Grid, and could even allow those vehicles to be used as Grid assets that could provide ancillary services when parked. 24 25 In the 2010 IEPR Update, the draft of which was

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 released earlier this week, we discussed cost share funding 2 from the PIER Program that was used to leverage millions of 3 dollars in Federal Stimulus funds for Smart Grid research. PIER has awarded more than \$13 million to 17 Smart Grid 4 5 projects, leveraging more than \$400 million in Federal 6 Stimulus funds, along with more than \$800 million in private 7 investments. This amount of funding for Smart Grid research 8 represents a ten-fold increase over what's been done in the 9 past. And this influx of additional funding is really going 10 to accelerate the rate of industry growth and allow the PIER 11 Program to make a quantum leap in achieving its research goals in support of our energy and environmental policy 12 13 goals. This funding is also going to help California 14 achieve the goals in the Governor-Elect's Energy Plan for 15 adding 12,000 megawatts of distributed generation and 8,000 16 megawatts of large scale renewables, as well as using energy storage to address peak power demand and to firm up 17 18 intermittent renewable resources.

19 For the 2011 IEPR, the IEPR Committee released a 20 scope earlier this year, noting the need to examine energy 21 storage issues, renewable integration, and electricity 22 infrastructure planning, and Smart Grid is clearly a key 23 component of each of those areas. So, for today's agenda, I will hear first from Heather Sanders, from the California 24 25 Independent System Operator, about the CAISO's Smart Grid California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 Objectives and Strategies; next, Mike Gravely from the 2 Energy Commission's PIER Program will provide an overview 3 and history of the Smart Grid Research Road Mapping projects that are being funded by PIER; that will be followed by 4 presentations on the three projects by EPRI, JPL, and RW 5 6 We will hear about the Smart Grid and the Investor-Beck. Owned Utilities this morning, we'll break for an hour for 7 8 lunch, and then we'll resume in the afternoon to the 9 presentations on the Road Mapping Projects for Vendors and 10 Manufacturing, and then for the Publicly-Owned Utilities. 11 And there will be an opportunity for Q&A after each 12 presentation.

13 Later this afternoon, we'll hear from the PUC on the status of its implementation of Senate Bill 17, which 14 requires the Investor-Owned Utilities to develop and file 15 Smart Grid Deployment Plans with the PUC by July 1 of 2011. 16 17 We'll then open it up to public comments, after which Mr. 18 Gravely will talk a bit about Action Items and Next Steps. 19 During the public comments section of the agenda, we'll take 20 comments first from those of you here in the room, and then 21 we'll turn to the people who are participating on WebEx. 22 For those of you who are here in the room, it's helpful if 23 you can speak at the center podium and use the microphone so 24 we can capture your comments in the transcript, and it's 25 also helpful if you can give our transcriber your business California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 cards so we make sure that your name and affiliation are 2 correctly reflected. WebEx participants can use the chat 3 function to let the WebEx Coordinator know that you have a question or comment, we'll open your line at the appropriate 4 time, and we are also accepting written comments until close 5 6 of business on January 7th. And the Notice for today's workshop, which is available on the table in the foyer, and 7 8 also on our website, gives the procedure for submitting 9 those comments to the IEPR Docket. And with that, I'll turn 10 to the dais for any opening remarks.

11 CHAIRMAN DOUGLAS: Good morning. Welcome, everybody 12 and thanks for being here so late into December, relatively 13 late into December. I'm certainly looking forward to all of 14 the presentations and I'm looking forward to hearing from 15 everyone here.

16 COMMISSIONER WEISENMILLER: Good morning. I'm 17 Commissioner Weisenmiller. We, again, appreciate everyone's 18 participation today, and certainly we're looking for - this 19 is an interesting topic for us in terms of looking at how 20 the PIER research links to the California policy objectives. 21 Obviously, Smart Grid is very important on a national level, 22 California is the home of Silicon Valley, we hope will drive 23 that process, and at the same time, given the state's policy 24 goals, particularly the goals of the new Governor-Elect, 25 we're very interested in seeing how the Smart Grid and the

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

California versions of that should really be fine-tuned to
 deal with demand response, distributed generation, and
 renewable integration issues. So, again, thanks for your
 participation, and let's move on.

5 MS. KOROSEC: All right, we'll start with CAISO. 6 MS. SANDERS: Thank you. Good morning, Commissioner Weisenmiller, Chairman Douglas. My name is Heather Sanders 7 8 and I am the Director of Smart Grid Technology and Strategy 9 for the California ISO. I really appreciate the opportunity 10 to share with you our recently published Smart Grid Road 11 There's been, as you all know, so much industry Map. momentum around the Smart Grid, and with all of the 12 13 aggressive energy policy goals, the ISO felt like it was 14 time for us to really solidify our direction, at least at a high level, related to Smart Grid, and communicate this to 15 our stakeholders and really start to engage. So, about 16 17 early this year, we engaged with EPRI and Internex to 18 support a road mapping effort for us. So, what we did is we 19 started out with, you know, the California policy 20 objectives, as well as the ISO objectives in mind. You 21 know, you always hear from the ISO, first and foremost is 22 the reliability. You know, energy policy goals will all 23 fall by the wayside, you know, if the lights don't stay on. 24 So, with all of the renewables, you know, a lot of this, 25 Suzanne already mentioned, we're going to need better California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

visibility into what's going on at the System. We also need to ensure we utilize all the assets we have to improve the efficiency as best we can. Flexibility is also going to be very important for the ISO, as all of these variable generation resources come into the market.

6 You know, currently we balance the system with 7 conventional generation, but enabling diverse resource 8 participation by storage, by demand response, and 9 conventional generation where needed, we'll have the 10 flexibility to balance that variability in the most cost-11 effective way. And, of course, all of this has to be done 12 in a very secure way.

13 So, the result of this work, this road mapping 14 effort, our strategy really centers around five technology themes, Advanced Forecasting, Synchrophasors, Advanced 15 Application, Cyber Security, and then a very long name, 16 17 Enabling Demand Response Storage and Distributed Energy 18 Resources. I'll talk about each of these a little bit. The 19 goal today is to really provide you a high level view of 20 what's in our road map document that is published. What we've included, and I've put these on the slide so you'll 21 22 recognize them in the road map document, we include a vision 23 for each of the technology areas, and then there's a 24 description in there that describes from the ISO perspective 25 why each of these technology areas are important. And then California Reporting, LLC

1 a 10-year forward look on the road map. Now, we all 2 recognize, and we did this based on the energy policy goals 3 we have now and our understanding of the current technology and what's emerging and its current capabilities, but we 4 5 fully expect this to evolve over time. You know, things are 6 going to change, we're going to engage with stakeholders, do 7 pilots, do research, and then adjust this through time. So, 8 looking at advanced forecasting, I'm just going to point out 9 a couple of highlights from each of those. You know, what 10 the ISO needs to do is really evolve our renewable 11 forecasting capability and also increase our visibility into the distribution system. So, wind blows, sun shines, we get 12 13 generation, but we don't know when that's going to happen. 14 And in order for the ISO to commit resources to meet the 15 load at that time, which is now not just load that we 16 understand, that we've understood for the last 100 years, 17 it's load that is now affected by distributed PV that is now 18 reducing the amount of load that the Grid sees, it is 19 changed by the proliferation of the electric vehicles, and 20 it's also changed by any price responsive demand. And the 21 ISO has to be able to understand this to most effectively 22 commit resources, so we have them available, but we also 23 don't over-commit them, either.

So, from a forecasting perspective, you know,
there's really three areas, and if you notice the different
California Reporting, LLC
52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 colors, it really represents a loose grouping of activities 2 within each of the technology themes, so wind forecasting, 3 solar forecasting capabilities, as well as understanding how 4 we're going to get that visibility into the proliferation of 5 PV. I mean, there's very aggressive goals about distributed 6 generation, as we know, so we're trying to look forward to 7 understand how we model that in our systems.

8 Moving on to the synchrophasor theme again, you'll 9 notice the vision and the 10-year look ahead on here. You 10 know, synchrophasors provide measurements very frequently, 11 more frequently than we have today. Synchrophasors have 12 been around for a long time. You know, it's only now with 13 the advancement in communications and the data processing 14 speeds that we're able to use this data more effectively. What this can provide us is a real time view of what's 15 happening on the grid right now. This data can also be used 16 17 to trigger automated alerts to operators and, eventually, 18 automated controls that can resolve problems before they 19 result in widespread Grid instability.

20 So, once we have synchrophasor measurement devices 21 out there, we have forecasting equipment out there, we can 22 start to use this data in advanced Grid applications. This 23 will help us see it better, use it better, and make sure 24 it's reliable overall. There's a lot of possibilities in 25 advanced Grid applications, and a couple things, you know, 26 California Reporting, LLC 27 S2 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 there are technologies now, there is still a lot of work 2 that needs to be done, but there are technologies now that 3 we can understand the conditions that are going on where the transmission lines are, you know, what is the ambient 4 temperature, what is the wind speed, what is the tension on 5 6 the line. And if we can reliably get this data back in, we 7 can dynamically rate the transmission lines, therefore, 8 getting the most out of them at any particular time. We 9 still have work to do on this, we need to do more research, 10 we need to make sure it's reliable to ensure we meet all the 11 reliability criteria, as well.

12 Another advanced application that is important for 13 the ISO is to improve our what we call "regulation 14 algorithm" or AGC, Automated Generation Control algorithms. Right now, those control algorithms help us manage frequency 15 16 on a second-to-second basis. They are reactive, in nature. 17 So, we take a state of the system, we dispatch the 18 generators to follow that. The system is going to become 19 more and more dynamic, including all of the renewables on 20 there, the storage, we need to make sure that those dynamic 21 models are built into this AGC algorithm and that it also 22 looks ahead, that this can become a more predictive 23 algorithm and it will closer bring the market, which is a 24 forward looking commitment with the AGC algorithms, which 25 right now are very reactive, so this is a very important California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 part of our research activity, actually, this coming year.

2 So, of course, the more applications you have, the more equipment out there, the more places where we have 3 4 vulnerabilities. Cyber security has to be built in from the beginning. There is a lot of activity on cyber security, 5 6 the National Institute of Standards and Technology, as well 7 as the PUC proceeding right now is taking hard looks at 8 security, and I know all of us are, as well. So, this is 9 pretty straightforward, it is something that we all 10 recognize needs to be there.

11 Finally, you know, this is the area that really 12 comes to a lot of the energy policy goals we have right now. 13 A standard flexible infrastructure that can really push forward, you know, the demand response and storage and 14 15 distributed energy resource objectives. There's a lot going on in this area, you know, I mentioned this before, but 16 17 really from a technical and a reliability perspective, the 18 ISO has to understand how this is going to work. With what 19 demand response could provide us, we need to work with the 20 utilities, work with the demand response aggregators, to understand what could happen. You know, if we have everyone 21 22 respond at once, that causes a frequency problem. We need 23 to manage this, we need to understand how this could work, 24 and how it could work together. You know, one observation 25 is the California Clean Energy Future, you know, strongly California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 mentions Smart Grid technologies and how they will support 2 the demand response objectives through dynamic pricing, and 3 also the integration of renewable resources. So, we need to 4 make sure that we understand how these things could happen, 5 how they will work, so there aren't any unintended 6 consequences. So, this is a really big area of focus for 7 us.

8 So, this red map really represents our initial 9 thinking and it's at a high level, and really what we want 10 to do is we want to engage with all of you, we want to 11 engage with our stakeholders, we want to understand your 12 objectives, we want to integrate this and work all together 13 to advance these goals. So, again, thank you very much for 14 your time, and I look forward to future conversations.

COMMISSIONER WEISENMILLER: Hi. 15 T have a few 16 questions. The first one is, and actually they are 17 combinations of process, technology, and all that. But 18 starting out with the process one, I guess, or it's probably 19 more of an observation, is that one of the things we need to 20 do this year in the California Clean Energy Vision is to tee up a process for our three, or for all four of the agencies 21 22 to actually spell out the Smart Grid component, and so I 23 think it's certainly trying to put our staff and certainly the ISO and the PUC on notice that we need to start building 24 25 out that overall vision there and assigning the roles and California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 responsibilities there. And obviously, to the extent this 2 IEPR can provide a forum for some of that laying of the groundwork, that is at least part of my objective. I don't 3 know if you've given much thought to how the three agencies 4 5 in terms of their areas of responsibility and work here, how 6 best can we move forward. I know there is the PUC OIR, we 7 are seeing the framework, but also in terms of trying to 8 make sure that what we need to do here, presuming we're PIER 9 oriented, and what the CAISO has to do, all gets in place 10 this year.

MS. SANDERS: Yeah, that makes a lot of sense. I think the forum, the California Clean Energy Future and the work done there, I think that's a really great place to start and, you know, as that gets built out, it will make sense to define how it fits into the IEPR.

16 COMMISSIONER WEISENMILLER: Now, the next question 17 is that, as we - obviously, a lot of our PIER research is 18 really focused on transmission. You talked about the 19 synchrophasor part. Now, how far can we go from the 20 synchrophasor, that system, into reading into the 21 distribution system, to move out of transmission into 22 distribution?

 MS. SANDERS: So, how can we use the synchrophasor
 technology to get visibility into the distribution system?
 COMMISSIONER WEISENMILLER: That is correct. Or do California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

we need to do adaptations or new technology to get that same
 sort of MRI-like tracking, not just on a transmission
 system, but on the distribution system, particularly as we
 put more and more distributed generation on the circuits.

5 MS. SANDERS: Yeah, I think that's a very 6 interesting concept and, in fact, Michael Montoya from SEC 7 is doing some of that in the demonstration project, the 8 Smart Grid Demonstration Projects they have, and so we're 9 very interested in how that can give us that visibility.

10 COMMISSIONER WEISENMILLER: Does the ISO have a 11 sense of what circuits in California have very high levels 12 of DG, so that we can start trying to hone in on tracking 13 what's going on in those circuits?

MS. SANDERS: I don't know that we've done a study of that yet. I mean, we are not at the penetration levels now on the distribution circuits to have it, you know, show up. But it is something we need to take notice of, it's something that's in our minds, and it is important, and we'll be working with the IOUs to get something that makes sense for both sides, to get visibility.

21 COMMISSIONER WEISENMILLER: Yeah, I was told by Jim
22 Avery that they have some circuits already that are getting
23 to high levels, and they're seeing voltage swing, so if we
24 can try to start identifying among the IOUs or POUs anywhere
25 high distribution circuits - high penetration distribution
California Reporting, LLC
52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

circuits, we can start trying to monitor those and see what
 types of issues come up.

3 MS. SANDERS: That makes sense.

4 COMMISSIONER WEISENMILLER: Okay, thanks.

5 MS. SANDERS: Thank you.

6 MR. GRAVELY: Good morning, Commissioners. Good 7 morning, everybody here. I'm Mike Gravely from the Public 8 Interest Energy Research Program. What I'd like to do today 9 is just give a little bit of a lead-in to the rest of the 10 day's session, and talk about the specific research that 11 we're doing today and you're hearing about, and give you a little bit of insight of the schedule because each contract 12 13 is on a different schedule, so you'll hear different levels 14 of detail based on how much they've completed. For those, 15 just a quick review, that the primary purpose today is a 16 technology review, so this is kind of a technology process. 17 We are going to be talking policy and questions. We 18 envision another workshop in the spring that we'll be 19 talking more specifically about what we've learned and how 20 we can take this into some policy questions and research 21 questions and GAP questions, but part of the discussion 22 today - most of the discussion today - is going to be on how 23 the technology looks, what technology challenges there are, 24 what successes are coming, what areas are missing, and how 25 that view may be different from the perspective of the large California Reporting, LLC

1 utility, smaller utilities, and the vendors and the providers of those services. But, throughout the day, we'll 2 3 talk about other PIER research in Smart Grid areas, and we're certainly willing to have some questions, if they're 4 asked, throughout the day to answer some of those questions, 5 6 and ultimately this is an opportunity for us to discuss a 7 view looking ahead, and also to highlight as we've already 8 begun to discuss things that we should look into, like, for 9 example, the synchrophasors at distribution level vs. 10 transmission level, that's a good topic for us to begin to 11 look and see what is being done, and what should be done, as 12 we do more and more distributed resources.

13 For those online and those here that aren't familiar with the PIER program, we have been around since 1996, 14 started in 1997, we look at electricity, natural gas, and 15 the transportation sectors, about 80 million, used on the 16 17 average by 85-86 million a year. In research, there are 18 quite a few active projects. We focus a lot on clean 19 energy, we focus a lot on research to address the policies 20 in California, and move us forward, so we see Smart Grid as 21 one of the key enabling technologies, I don't think Smart 22 Grid is the end of the road, Smart Grid in our mind is the 23 technology that makes everything else work and brings it 24 altogether.

25

Why Smart Grid is important to us, it's just a quick California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 summary that we use a lot in the presentations I give, it's 2 certainly in the recent election in California, we 3 reevaluated how important the environment is to California. Smart Grid is an enabler to allow the green grid and green 4 technologies to operate more efficient, more effective, and 5 6 better use of existing resources, as well as providing new 7 low cost technologies that may provide more for less. We 8 have, for example, one of the research areas that we do in 9 the PIER Program is we look at long term research in certain 10 areas, and the goal is to have something that is 10 times 11 the cost, 10 times better performance, that goes out there 12 and meets the needs so we have the opportunity to reduce 13 costs and increase performance with technology.

14 Grid operations, being able to operate with 15 distributed resources, as well as essential resources, and 16 have better reliability than we have today. For example, one of the things people measure in reliability is not only 17 18 how often you're out or down, but how long you're down and 19 how fast you can recover, so the ultimate goal is to have 20 less outages, when you have an outage, to recover faster, 21 and also to be able to detect it sooner.

The big picture here today, of course, is this is all about the customers of California, and the ratepayers that are out there, making the system better for them, overall lowering the cost as we go into the future, giving California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

more choices to the customers, and also providing better
products. We use an analogy here a lot in the cell phone
arena, you know, if you look at a Smart Phone today and you
say, "Is that a phone, or is it a lot more?" And most
people will say a Smart Phone is a lot more than just a
telephone, and so the Smart Grid, it is a lot more than just
electrons flowing around the Grid.

8 As we mentioned earlier, we are in a real 9 interesting time in the research community. The PIER 10 Program, as a result of the ARRA awards nationally, there is 11 some \$8 to 10 billion, if you figure the government money plus the match money, over \$1.3 billion of that is coming to 12 13 California, a lot of technology demonstrations, lots of 14 information to learn. So, one of the challenges we have is to, as you'll hear from the utilities, is to learn from this 15 16 and to move forward. So, some of the concepts today are 17 looking at what we will learn from these different projects 18 and how that will affect the Grid in the future.

19 This research that we have today actually came out 20 of a project that we did, the report is available in a paper 21 copy for those that are here, it is available online, the 22 link to it is in the announcement for this workshop. So, we 23 actually asked EPRI to look at us and say, "What are all 24 things Smart Grid?" And this report explains all the 25 elements of Smart Grid, it explains what some of the California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 challenges are and what the future view was, and as a result 2 of that, we evolved the work we see today, and that was we 3 really need to sit down and develop kind of a vision of how it all integrates, and we started off thinking about that we 4 want a utility view and we want an industry view because how 5 6 a utility processes things and the schedule they do, and 7 their way of doing it is one perspective; how commercial 8 industry and for-profit business operate and think is 9 different also. So, we wanted to hear two different 10 perspectives, and then merge the two to come up with kind of 11 a consolidated or combined perspective for California. And 12 as we got into it, we realized that the public utilities 13 have some unique perspectives, different from large 14 Investor-owned utilities, and so we added to that perspective the third contract, which you'll hear about 15 16 today, which is going to look at the view of Smart Grid from 17 the public utility perspective. And also, those of you who 18 are familiar with SB 17, the Investor owned utilities have a 19 deadline of 1 July 2011 to come up with their deployment 20 plan, the public utilities have 1 July of 2012, so they are 21 also part of SB 17, and they also will be developing 22 deployment plans and road maps for each of their own 23 utilities.

24 One of the important things about the presentations 25 today and the work we've done is we didn't ask a national California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 question, we wanted to look at California. California is 2 perceived by most, both nationally and internationally, as 3 the Smart Grid state. We have a lot of very aggressive and very environmentally sensitive and customer oriented 4 5 policies. The Greenhouse Gas Reduction, AB 32, the RPS 6 Goal, the Efficiency Goals, the Distributed Generation 7 Goals, Transportation Goals, and so we wanted our Smart Grid 8 to support California's future view, and that would be 9 different than other states. And when I've given this 10 presentation all around, I always point out the fact that we 11 have to look at where we're going. We have made decisions to install smart meters and we're installing smart meters. 12 13 We have made a decision that we need more renewables and 14 we're installing renewables, so it's important for this Smart Grid discussion you hear today, to hear how California 15 16 will proceed, and other states and other agencies that look 17 at it, it could be different for them because they may not 18 have the same combination, but they're looking to us to lay 19 the groundwork. And I think we've found in my travels and 20 discussions and research that a lot of people are looking to 21 California to help resolve some of these questions so they 22 can follow in the footsteps of what we're doing. 23 Two quick challenges you'll hear a lot about, 24 obviously the integration of renewables, this shows the wind

25 perspective, it's one of the best charts I've seen, to show

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 the difference in how it affects the systems that provide 2 the generation. On the upper left, you can see the lower 3 parts, those systems, nuclear systems and other systems that 4 like to just turn on and operate and not vary, and in the 5 lower right, you see that they have to move a lot of 6 variations, and so those are not operations that are 7 supportive for their performance, and their long-time life, 8 and so we need to find ways to level off those peaks with 9 distributed assets, with storage, and other things so we can 10 operate the Grid successfully in the future with large 11 penetration of renewables as we do today with the smaller 12 penetrations. So, you'll hear today about different 13 technologies that will help us do that. And solar itself, 14 in California we already have a lot of solar energy, but it 15 does ramp up very fast, and it does ramp down very fast in the evening, and so, as you've heard from the ISO, that 16 17 creates some challenges. If you know what's going to happen 18 and you plan for it, that's one thing, if you know it's 19 going to happen and it doesn't happen the way you planned, 20 that's the second problem, and if it happens and you didn't 21 even think about it, that's the third problem, and we have 22 all those problems occurring with these systems, but they are all manageable and there are options of how to handle 23 24 this so that we can continue. It's pretty clear, certainly 25 in California and a lot of the country now, that the desire California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 to use more and more renewables is everybody's desire, and 2 nobody seems to be backing off from that.

3 Just a quick understanding, so the contracts we have today, you'll hear this morning from EPRI, the three IOUs, 4 5 and their contract is actually almost over, they have 6 drafted their final report and we expect to publish that 7 report in a few months. You will hear the details of those 8 reports and analysis, so questions and answers, they have 9 done their whole project, and so they should be able to 10 provide some pretty good answers and some pretty good 11 questions. Obviously, every time you learn something new, there may be something they would like to do, but they are 12 13 at the point of wrapping up their contract and sharing 14 everything from there, so this is a first discussion. We have a little more time because we envision one more detail 15 16 and two more questions, and I would encourage people to ask 17 questions.

18 In the afternoon, the contract with JPL is about 19 half over, so they have just begun doing their stuff, 20 they're just getting their assessments, and they're 21 interested in feedback on what they should think about, as 22 well as what they've done, so you'll hear a little bit about 23 how far they're going, how they're thinking, and what 24 they're going to do over the next several months as they 25 complete their research and wrap up their report. And then California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 RW Beck, you will hear that their contract - Steve, has it 2 been signed? I think we're really close, but - so we have a 3 signed contract in days, so you will hear from them on what they propose to us as a plan, and they will listen and be 4 5 interested to learning what the questions and issues are so 6 they can address those, and they'll talk to you about some of the challenges that they see going forward as a spokesman 7 8 in developing a centralized view for the Public Utilities. 9 So, we'll have the three perspectives. After each 10 discussion, there's time for questions on that particular 11 speaker and, at the end of the day, there will be some 12 discussions for any of the topics. And, again, if questions 13 come up, in addition to these what kind of PIER research is 14 going on, that may address a separate question, we'll be glad - either myself or my staff - we'll be glad to answer 15 16 questions on that from there, and then we'll see. It is a 17 Friday, which most people consider the last work day before 18 Christmas, so I appreciate everybody around here, and we'll 19 do our best to be efficient, but we do want to answer 20 questions and we do want the feedback to both our staff, as 21 well as the researchers that you'll hear from, from there. 22 And with that, I guess I'll just do one quick thing and that 23 is, can we get some confirmation from somebody on WebEx that 24 they're hearing okay and we're not going to miss anything, 25 just somebody that can type in chat that everything is okay. California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 I know one of our previous workshops, we had a little 2 problem with the voice, and I wanted to be sure before we 3 got into the discussion that everybody is okay online. Yeah, would somebody just raise your hand on the chat box, 4 5 or type in the fact that the quality of the sound is okay 6 and you're seeing the picture, just before - okay, thank you 7 all very much. And with that, I will introduce our first 8 speaker here.

9 COMMISSIONER WEISENMILLER: Okay, Mike, I had one 10 more question for you, just to make sure we're all on the 11 same page. Do you have a concise definition of Smart Grid? 12 MR. GRAVELY: Uh, well, I think - I want to answer 13 that question by saying part of the questions that you'll 14 hear today from the presenters is to come up with a 15 definition of what Smart Grid is today at 2010 and what will 16 it be in 2020. I think, in general, what we have used a lot 17 from the research perspective, I do not believe a unified 18 definition exists, I don't think a policy definition exists. 19 I think, depending on who you go to, Smart Grid is 20 everything to everybody. What we have consistently seen, 21 though, is that the Smart Grid is a merging of the 22 information technology communications world and the utility 23 power industry. And one of the challenges when we first started three or four years ago, and we actually were doing 24 25 Smart Grid research before it was a recognized Smart Grid, California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 certainly for the policy in the country was approved, is in 2 fact one of the challenges is you have to merge the Internet 3 protocol world with the power engineering world. And actually, I have talked with people from four or five years 4 ago that said they would be getting a room, and people would 5 6 walk out, they didn't communicate. And I think we're way 7 beyond that now, but early on. And the standards and 8 concepts, so the concept of how an IP standard is addressed, 9 and how they handle problems, is not the same process that 10 is handled for a power engineering Grid related issue. And 11 so there were some real challenges to get the two together, 12 but I'd have to say, there is a definition that says what it 13 is physically, and there's a definition of what it's capable 14 of doing. But I have seen, I can share with you from another presentation a verbal just definition of what Smart 15 16 Grid is, I don't have it in this presentation, but I haven't 17 seen two people in two presentations use the same definition 18 yet, personally.

19 COMMISSIONER WEISENMILLER: Thanks, Mike.

20 MR. GRAVELY: I don't know if there's anybody in the 21 audience here who has a definition that they've used in 22 recognition, but it's probably something we might work on as 23 what the infrastructure issue of this year's IEPR, but it's 24 very important to do that. So, with that, I'll turn it over 25 to Angela Chuang, who is our Project Manager for this, and 26 California Reporting, LLC

1 her three partners are from the three IOUs today, and so
2 she'll be giving an overview, and all three IOUs will be
3 speaking, and I encourage everybody online, as well as here,
4 to ask tough questions. Thank you.

5 MS. CHUANG: Thank you. Good morning, 6 Commissioners, ladies and gentlemen. It's my pleasure as 7 Project Manager for EPRI on this project to kick off our 8 EPRI IOU team presentation on the California Utility Vision 9 of Smart Grid for the State of California by Year 2020, and 10 the road map to achieve the vision.

11 So our presentation will be presenting the findings from our project that has been ongoing since late January 12 13 this year, including a little bit about our project 14 assumptions, the background, and the policy drivers for 15 Smart Grid that we investigated up front, then the meat of 16 the findings, which is the 2010 baseline for Smart Grid, the 17 2020 vision, and examples of technology writing those road 18 maps to achieve the vision that we will share. Also, 19 towards the end of our group presentation, we'll discuss 20 policy concerns and overall conclusions and recommendations. 21 The overall goal of our project was to work in 22 partnership with the California investor-owned utilities to 23 define what is a Smart Grid for California by the year 2020, define the vision and a road map to achieve the vision, with 24

25 2010 as our baseline. The fundamental assumption is that,

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

given the energy policy drivers for Smart Grid are what are really driving Smart Grid in the state, that the Smart Grid vision and roadmaps that we define need to support the energy policies that exist in California. And so, that was the fundamental assumption and a requirement in our project, that the Smart Grid supports the energy policies of the state.

8 In order to proceed, then, we had a detailed 9 investigation of what the policies are, and we classified -10 Mike Gravely had a similar slide to this - this has been updated since the initial classification of policies in our 11 12 2008 California Smart Grid Report. And it shows a number of 13 energy policy targets in different categories from 14 greenhouse gas emission reductions to renewable energy targets, and energy efficiency demand response type targets. 15 Most of these on the slide are targets, some, just a few of 16 17 them on this slide, are incentives. After looking at the 18 policies in the various varieties here, our team asked, 19 well, what about reliability? So we also added that to the 20 slide. And, on the bottom of the slide, we can see a number 21 of reliability reporting type activities, emergency 22 standards for operations, and safety, and so on, and 23 inspection and maintenance type standards. Also, the 24 California Resource Adequacy Requirement that has been 25 instilled a few years ago, that is also for reliability California Reporting, LLC

1 purposes.

2 Our project went through a number of stages. In the 3 beginning, we brought the leadership team together to define what are the assumptions for the project, what are the 4 5 guiding principles, and what types of frameworks should we 6 develop that we can give to the rest of our project team to 7 fill in the details. So, we started off defining quiding 8 principles and frameworks for our project, then we came 9 together as a team to vet and review and provide further 10 details for the baseline, the vision, and the technology 11 readiness road map exercises that all three IOUs, EPRI, and 12 some subcontractors concentrated on, in a series of 13 workshops that spanned from April through July of this year, 14 and we have drafted the final report and presentation that 15 resulted from the workshop series. And we're currently 16 under the review process prior to publication of the final 17 report.

18 So, in the beginning, the first stage of the 19 project, one of the activities we conducted was to identify 20 the basic assumptions for the project. As mentioned 21 earlier, the energy policy targets are met by year 2020, the 22 existing ones. We studied them and it was just the basic 23 assumption, that they are met. How do we define a vision 24 road map to support those policies and targets? And another 25 assumption is, as increasing renewable penetration markets California Reporting, LLC

1 continue, there are certain amounts, certain types of 2 uncertainties, that need to be managed and handled 3 logically, and we assume they are. And that includes the 4 ownership of the resources on the customer side, the 5 uncertainties in the face of aging infrastructure and 6 equipment failures which will more likely occur before that 7 aging infrastructure is replaced, those sources of 8 uncertainties are handled logically. And in this 9 environmental of Smart Grid, with the customers now owning 10 resources that could be relied on by the Grid, we assumed 11 that rates make sense to encourage fair behavior, including 12 customer participation by lending their resources to support 13 the Grid, so there are rates in place that make sense to 14 encourage the cooperation on end use.

15 Smart Grid accommodates market enablement and 16 customer driven choices; this is as opposed to a traditional 17 paradigm of utility driven type demand response and demand 18 side activities. So, in the 2020 paradigm, the customer has 19 choices and the markets enable those choices, and the 20 choices are customer driven to meet their needs. Finally, 21 that Smart Grid will accommodate the integration of 22 alternative resources, whether it be plug-in electric 23 vehicles, renewables on a distribution or transmission 24 system, distributed storage, bulk storage, these alternative 25 type of resources will be accommodated. Those are our basic California Reporting, LLC

1 assumptions. So, we organized our project team into six areas of technical expertise which we called "domains," 2 3 domains of technical expertise, which are listed here in the first heading, the top row of this diagram, spanning from 4 5 communications infrastructure and architecture domain team, 6 to customer systems, Grid ops control, renewable and DR 7 integration, capital asset efficiency, and workforce 8 effectiveness. Within each of these domains, we define 9 Smart Grid uses, broad areas of what would the Smart Grid be 10 used for, and these are the areas that our team decided that 11 we will focus on. There are a total of 19 of them. We developed technology readiness road maps for each of these, 12 13 each of the 19, so we have 19 and we'll provide some 14 examples of these road maps later.

One question that is important to address besides 15 16 what are the uses of a Smart Grid are, well, what's the 17 objective for that particular use? What's the reason? Why 18 are you using the Smart Grid for that? So, we categorized 19 here, this list comes from a previous EPRI report, Possible 20 Categories Objectives in the first column, from 21 environmental compliance like a use to meet renewable 22 portfolio standards, it's for environmental compliance or to 23 reduce greenhouse gas emissions, it's for compliance, all 24 the way to enhancing customer choice, improving system 25 economics, maintaining enhanced system reliability, and California Reporting, LLC

1 improving power quality. So, keeping the Smart Grid uses in 2 the different 19 categories I showed earlier on the previous 3 slide, plus these possible reasons for using the Smart Grid, 4 we asked our team, tell us what are the top priority Smart 5 Grid uses and associated objectives for that use. What are 6 the top ones? And these here were almost unanimously 7 identified by our IOU team members. For example, bulk wind 8 and solar integration to meet RPS and reduce greenhouse gas 9 emissions, unanimous top priority here, all the way to why 10 there is situational and data integration for system 11 protection restoration. The color coding here shows the 12 different types of objectives, the green being the 13 environmental compliance, the blue here, customer needs, 14 that's about enhancing customer choice, and reduced peak demand, reduced losses, is about enhancing system economics. 15 16 So, these are the top priority ones and this list shows the 17 high priority Smart Grid uses and associated objectives. 18 For example, high priority, the top priority, was basically 19 the IOU's, most of them saying, "This is the top priority," 20 whereas high priority is one level lower in ranking, it is 21 "a high priority." So, this is a result for the second 22 level of priority, for example, demand response for 23 enhancing service innovation under capital expansion. So 24 the use is demand response in the black, and the color 25 coding is the type of objective. So, it ranges. And it's California Reporting, LLC

1 interesting to note, on the previous slide, that we have PV, 2 plug-in electric vehicle integration, the objective of that 3 is reducing greenhouse gas emissions, for example, and meeting customer need. The meet customer need is 4 5 representing the pool of the customers, they are going to go 6 out and they're going to buy the electric vehicle, and the Grid needs to support that pool from the customer side of 7 8 the market.

9 So, after we did that exercise, then we also wanted 10 to make sure we covered all the bases of all the different 11 dimensions of consideration for Smart Grid Vision and Road 12 Mapping exercises, so we looked at - we had our technical 13 team of great experts looking at what's operationally 14 possible, what's physically possible with technology, and we had done the exercise of looking at the policy drivers on 15 the top plane, and the cost benefits, as well, among the 16 17 leads in our group, of Smart Grid in general terms. And 18 this slide shows that there are many dimensions of 19 consideration that need to be taken into account in a road 20 mapping effort and vision exercise because the regulatory 21 and the commercial dimensions on the top plane, they are the 22 drivers for Smart Grid, and they determine what's probable 23 with Smart Grid, whereas the bottom plane, the technical, 24 the operational, the physical, that determines the means, or 25 what's possible with Smart Grid. And together, you kind of California Reporting, LLC

1 close the domain space of what's possible and what's 2 probable, and so we considered all these dimensions. And 3 these types of factors, policy regulations, technology operations, they're evolving over time, so in our road 4 mapping exercises, we pretty much say what technology stages 5 6 will occur, in what order, it's not a prediction of when exactly that will happen because there are all these 7 8 evolving considerations over time that impact the actual 9 outcome.

38

10 So, in the baseline presentation, we offer - the Baseline 2010 Presentation of our findings offers a 11 12 framework to describe Smart Grid technologies. This comes 13 from the 2008 EPRI Smart Grid study for the California 14 Energy Commission, where we show the power system resources on the very bottom level, which starts from generation all 15 16 the way down to transmission substation and distribution and 17 end use, so this is the power level of technologies, the 18 resources themselves, and the assets. And everything else 19 above has to do with the logic, the remote sensing, and 20 controls, the algorithms for controls embedded in the 21 devices, for example, of the Grid. And the communications 22 infrastructure that serves as a medium to take the 23 information from the control sensors and exchange it with 24 the data integration layer that provides one source of truth 25 for data to the applications that require it. So everything California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 above the bottom level of this technology framework, 2 everything has to do with the sensing and the controls and the logic to manage the resources. So, this can be thought 3 of as the logic level of technologies, and the bottom is 4 5 actual physical power assets. So, given that, and one other 6 thing is that these columns represent the different parts of 7 the electric power industry from generation to transmission 8 distribution, and end-use. So, looking at this technology 9 framework, we can more simply describe what is a smart grid, 10 and from our 2008 findings, it was described as the 11 intelligent use of information across traditional 12 boundaries. So this one example shows the distribution 13 operator, for example, interested in using advanced metering 14 data to inform certain applications like outage management, for example, and that crosses traditional boundaries, and 15 16 there is a lot of initial activities using advanced metering 17 to inform distribution operations. And then, this second 18 example we have is the Transmission Grid Operator expressing 19 interest during our interviews back in 2008 of using 20 advanced metering capabilities to enable demand response to 21 balance intermittent generation on the transmission grid. 22 And finally, an activity with another group, also 23 CEC funded, where the procurement team and the customer 24 service side of the utilities working on a project with EPRI 25 this past several years to value, to come up with a

39

California Reporting, LLC

1 methodology, to value how much voided cost can be captured 2 on wholesale settlements from 1 megawatt demand response, by location, by resource. So, that project also spanned 3 traditional boundaries. So, this is our simple one-sentence 4 description of what a Smart Grid was, it is the intelligent 5 6 use of information across traditional boundaries where every 7 vertical line here, and every level of technology represents 8 a traditional boundary. If there are no clarifying 9 questions, we have our next presenter, Kevin Dasso from 10 PG&E, who will describe the 2020 Vision Findings from -11 COMMISSIONER WEISENMILLER: Okay, actually I have a 12 few clarifying questions. First of all, when you talked 13 about back on - I think it was slide 4 - that basically this system is dealing with the reliability standards, I just 14 wanted to clarify that, by that, you included the NERC 15 16 reliability standards? 17 MS. CHUANG: Categorically, that would be included,

18 definitely.

19 COMMISSIONER WEISENMILLER: Okay. The next question 20 is, on your slide under Assumptions for Projects where you 21 talked about rates make sense, that's, I think, slide 7, 22 again, specifically are you referring to dynamic pricing? 23 Or what?

24 MS. CHUANG: Just the - not specifically, but 25 dynamic pricing is included in the area of restructuring of California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 rates.

2 COMMISSIONER WEISENMILLER: Okay, so what are the 3 other elements, then?

4 MS. CHUANG: Other possibilities of structures could 5 be - there's things I've seen that we don't have in the U.S. 6 that are broad, like demand subscription, for example, or alternative pricing structures, other than charging 7 8 customers on the basis of energy, just energy. It could be 9 also, for example, based on power, which you can find in CNI 10 customer rates, all kinds of examples, those are just a few 11 examples. But the whole space of rate restructuring is what we're referring to here, alternatives. 12

13 COMMISSIONER WEISENMILLER: Okay, now, on Slides 10 and 11, I was just trying to find - this is the top 14 priorities, so I was trying to check on whether the 15 integration of distributed gen is listed as a top priority. 16 17 MS. CHUANG: Yes, all kinds of distributed 18 generation. In this area, the broad term of distributed 19 generation, it could include PV, for example. So we have PV 20 in the list here.

21 COMMISSIONER WEISENMILLER: Okay, but basically you
22 want to make sure that distributed gen, distribution level,
23 localized generation, is part of this vision.

24 MS. CHUANG Oh, definitely. It includes like 25 electric rail and electric – integration of PV, example California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 here, to reduce greenhouse gas emissions, there is PV, we
2 looked at CHP, as well, different types of generation in our
3 ranking exercises.

4 COMMISSIONER WEISENMILLER: Okay, and last question 5 is, as you go through the Smart Grid definition and vision, 6 was there agreement among the California Utilities and you 7 on what the hardware and software pieces of that are, or 8 would be, in terms of how to translate the vision and goals 9 into specifics?

10 MS. CHUANG: We would like to present some examples 11 of that in our Technology Road Map exercise examples later 12 on, but, yes.

13 COMMISSIONER WEISENMILLER: Okay, that's fine.14 Thanks.

15 MS. CHUANG: Kevin Dasso from PG&E is up next. 16 MR. DASSO: Good morning, everybody. My name is 17 Kevin Dasso. I'm PG&E's Senior Director of Smart Grid and 18 Technology Integration. I'm happy to be with all of you 19 this morning. So, I'm going to talk a little bit about the 20 vision, kind of building off of what Angela laid out in 21 terms of some of the introductions. This is a tag team 22 presentation, so I'll be handing it back to Angela and we'll 23 hear from the other team members as we go forward. 24 So, in terms of 2020 vision, one of the first things

25 that we did was really to take a look at what have others

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 said about Smart Grid. So, I think it was alluded to by Mr. 2 Gravely that, you know, many people have definitions of 3 Smart Grid, they've taken positions on it, so we thought it 4 would be useful to just do an inventory and at least say -5 get an understanding of what are the characteristics that 6 various organizations have put out there, that we ought to 7 be thinking about and that California ought to be thinking 8 about as it looks at its development of its 2020 vision. 9 And one of the aspects of any time you talk about Smart Grid 10 and the vision around that is, it is useful to think about 11 characteristics which are different from what the actual 12 Smart Grid is versus what it can enable, and so I think some 13 of the language which needs to be - you have to think about 14 that a little bit. And we've tried to parse that out as 15 we've gone through this.

16 So what we've put up on this slide is just three 17 examples of kind of listings of Smart Grid characteristics 18 that have been put out there, the first is EPRI's view and 19 EPRI's membership in terms of how they see the Smart Grid, 20 what those characteristics are, the second is really coming 21 from the DOE and their modern Grid strategy development 22 work, and then the third is essentially some of the 23 characteristics that have been described by the California 24 Public Utilities Commission in the ongoing Smart Grid OIR, 25 which built very much on the characteristics that were California Reporting, LLC

1 described in Senate Bill 17 that is kind of driving, you 2 know, at least State policy as it relates to Smart Grid 3 characteristics. So, there are a couple key themes here that I wanted to point out. The first is around 4 5 reliability, so we've got, you know, self-healing, 6 resilient, higher quality power, reduced impacts on outages, 7 so reliability is a theme. The second is customer 8 enablement and customer participation, so those are 9 expectations in terms of characteristics. The next one is 10 around markets, so enabling markets and making markets more 11 robust, that's a component, a characteristic. Integrating 12 renewable resources at all levels, so bulk system as well as 13 distribution system. And then, last but not least, it needs 14 to be secure, so secure from a Grid perspective, but also 15 secure from a customer information perspective, those are, again, some of the characteristics that we considered as we 16 17 developed our vision.

18 This is the actual vision statement, and I'm going 19 to read it first, but I'm going to break it down a little 20 bit; the vision statements can be a little dense and I think 21 it's worth kind of identifying the key components to this. 22 So, I'll just read it off first. The Smart Grid will link 23 electricity with communications and computer control to 24 create a highly automated, responsive, and resilient power 25 delivery system that will both optimize service and empower California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 customers to make informed energy decisions. So, a lot 2 there, and I'll kind of break it down a little bit, but 3 first I wanted the focus on is what is the Smart Grid, so I think Commissioner Weisenmiller, your question, you know, do 4 5 we have a concise definition of the Smart Grid? Well, what 6 is it? It really is the linking of electricity with communications and computer control, so that is the what, or 7 8 that is the what is the Smart Grid. The second part of this 9 vision statement also goes to how does the Smart Grid 10 accomplish what we're setting it out to do. And the how is 11 that we're highly automated, responsive, and resilient, as 12 we think about the Smart Grid. And then, the last part is 13 around benefits, so why do you do this? You know, what are 14 the benefits and there are many but we characterized them 15 really in two basic statements, that is, to optimize service 16 and also to empower consumers, that those are the main 17 elements.

And I want to just talk a little bit about optimizing service for a second. There are many demands that are being placed on the Grid going forward, so we've touched on some of those already. New requirements, so more intermittent resources, distributed resources,

electrification of transportation, those are all things that can be enabled in multiple ways. We believe that the Smart Grid is about how to optimize that, enabling those new

California Reporting, LLC

services while still considering costs and reliability,
 overall. So, there is this, I think, important concept here
 of optimization and, you know, the balancing of those
 elements.

5 And then, again, the last point here, but clearly 6 not the least, is that consumers are really at the heart of 7 all of this, so how can we help consumers make good choices, 8 have control over their energy usage going forward? So 9 that's the vision statement that we've used and developed 10 and would offer for consideration here.

11 The last point I'm going to make, or the last slide I'm going to cover is, again, kind of going to the 12 13 capabilities that we highlighted as investor-owned utilities 14 to focus on. Again, the Smart Grid, and there are many capabilities that can be enabled by the Smart Grid, and I 15 often hear people talk about all the things that it can do. 16 17 I think that if we really wanted to take a shot at trying to 18 prioritize those, you know, you really don't want to try to 19 do everything. If you try to do everything, you're probably 20 not going to do very much. So we really wanted to focus 21 this around what are those key capabilities that we're 22 after. And so the first is around empowering consumers in 23 the open market. So, again, that's a key theme, lots of 24 things you could do, these are things that we think are 25 important. The second is, you know, very much front and California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 center for California, and that is, you know, renewable 2 resources. And, again, distributed, as well as bulk system. 3 The third bullet is, you know, kind of one of my favorite themes here and that is don't forget about the Grid, you 4 know, that there are elements of this that, as we think 5 6 about capabilities, that we can't forget about, in our drive 7 to integrate renewables and enable customers, there are some 8 grid elements that we have to think about, and that is 9 around reliability, around economic efficiency, and around 10 security, and in the face of very complex and changing 11 environment.

12 And then, last, again, from the utilities' 13 perspective, we also need to focus on how can we increase 14 safety and productivity of our utility workforce to the benefit of our customers and providing a safe environment 15 16 for our customers. So, those are kind of the key 17 capabilities that we wanted to highlight. So, those are my 18 prepared remarks and if you wanted to ask a few questions, 19 we can do that, and then I'll hand it back to Angela to 20 cover the next section.

21 COMMISSIONER WEISENMILLER: That would be great, 22 thanks Kevin. I had a couple of questions. If you go back 23 to the Vision Summary for a second. I guess my question to 24 Mike and to Heather is whether both of you agree with that 25 definition.

> California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1

MR. DASSO: I'll yield to Mike.

2 MR. GRAVELY: I would say it has all the elements 3 that we've talked about. I have to be honest with you, we 4 haven't really taken - you'll hear different perspectives 5 today a little bit from this, but it has all the elements 6 we've discussed. Well, this is the utility perspective, I 7 would say it has a utility perspective.

8 COMMISSIONER WEISENMILLER: Okay.

9 MR. GRAVELY: I would say if you had a vendor 10 provide this, and maybe - I don't think we're going to talk 11 about it - but it certainly provides all the information, 12 but I would have to say that it is, in my eyes, through the 13 eyes of the utility vs. the eyes of the customer vs. the 14 eyes of someone else. So, we haven't actually vetted it 15 out, but it certainly has all of the elements that we

16 consider critical for Smart Grid.

17 COMMISSIONER WEISENMILLER: Okay, Heather? 18 MS. SANDERS: I would agree with Mike. The one 19 thing I would add to this is the visibility aspect, you 20 know, the automated response of resilient power delivery 21 system, as well as the optimization is very important, but I 22 would just add the visibility aspect to this.

23 COMMISSIONER WEISENMILLER: That's good, thank you.
 24 Okay, Kevin -

25 MR. DASSO: Can I respond, maybe I'll address California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 Heather's point.

2

COMMISSIONER WEISENMILLER: Sure.

3 MR. DASSO: So, in resilient, I think we have that 4 notion, I mean, in order to know what to do and be capable 5 of responding, you have to have visibility, so that's an 6 element of it.

7 COMMISSIONER WEISENMILLER: Kevin, in terms of the
8 PG&E circuits, are there any distribution circuits that, at
9 this stage, have very high levels of DG?

MR. DASSO: We do have a number of distribution circuits that have a large number -- of distributed generation or PV, in particular?

13 COMMISSIONER WEISENMILLER: Yeah, PV in particular. 14 MR. DASSO: We do. We have not - we don't have any circuits where the penetration has created huge concerns 15 yet, however, we have approximately 42,000 customer-owned 16 17 solar panels located in our distribution system, kind of 18 throughout our service territory. Those panels tend to be 19 concentrated in certain areas, particular neighborhoods, 20 subdivisions, and so on. We're beginning to see some of the 21 impacts of those high concentrations, but at a very 22 localized level. We're not seeing them causing any problems 23 at a circuit level, the issues are a little bit more 24 localized. However, these are concentrated in certain 25 areas, some circuits have a lot more of those units than California Reporting, LLC

1 others do and we know which those are.

2 COMMISSIONER WEISENMILLER: Yeah, no, my impression 3 was that PG&E has really led the nation in solar PV 4 installations on the DG, so in terms of looking for data, 5 I'm assuming if anyone has circuits that are very high 6 penetration rates, it would be PG&E.

7 MR. DASSO: We do have a rich database. I think one 8 of the challenges we have, though, is that today, in the way 9 those PV units were installed, or today and historically, is 10 many of those are a net metering kind of arrangement, so we 11 do not generally have visibility into what those PV units are doing, and so that's an area we'd like to leverage and 12 13 expect to leverage some of our Smart Meter capabilities to 14 get a better understanding of going forward. We know where they are, we know what they're supposed to be doing, we can 15 16 see the implications of them on our grid from our side, 17 however, we can't tell you at any given time what is the 18 output of that unit, and is it performing at the level it 19 was expected. Those, I think, are future enhancements that 20 we would expect to be able to add to that database.

21 COMMISSIONER WEISENMILLER: Did you have a sense of 22 what the highest penetration rates you have on these 23 circuits?

24 MR. DASSO: By number or -

25 COMMISSIONER WEISENMILLER: Percentage.

California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 MR. DASSO: Percentage, generally less than 10 2 percent of the capability, we have not reached that. At a 3 circuit level, we do have certain segments of those circuits 4 where the penetration, or where the actual PV output is 5 greater than 10 percent of the peak demand.

6 COMMISSIONER WEISENMILLER : Yeah, I guess the last 7 question for you is, having been sort of Ground Zero on the 8 Smart Meter installation, coming from those lessons learned, 9 what are your takeaways for the Smart Grid?

10 MR. DASSO: I think one of the key elements is how 11 to engage customers, I think that's - we have been on the cutting edge of all of that, and to some extent the bleeding 12 13 edge in some of that area. I think we've learned a lot of 14 lessons, we are applying those lessons going forward, I 15 think, with a very different type of response. We have a 16 very expansive outreach program now before we go into 17 communities where we have been reaching out almost two 18 months before we install any of the meters with elected 19 officials, with various consumer groups, we're coming in 20 with answer centers, with displays, and ways in which we can 21 inform customers about how they can use these devices, and I 22 think with a much different outcome. A couple things I 23 would like to mention, you know, kind of highlight there 24 that often get lost in all of the energy around PG&E Smart 25 Meter Program, we have over six million Smart Meters that California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 are fully enabled, meaning that they're being used for 2 billing, they can support communication with customers about what's happening on their usage. We have over 250,000 3 customers that are accessing, or have accessed, their hourly 4 5 data through Smart Meters via our PG&E website, so people 6 are beginning to use those tools. One of the other features 7 that we think is kind of neat and interesting is that, with 8 the Smart Meters, the interval billing capability, that 9 we're able to use hourly data and inform customers when they 10 are about to reach - as they move into a higher cost tier, 11 we call it "tier alerts," we have over 20,000 customers that 12 have signed up for tier alerts over this last year and we're 13 getting positive feedback on that. So, again, there are benefits and things that are being enabled here. 14

15 COMMISIONER WEISENMILLER: I guess the other issue, 16 obviously you've been hit with the concern on health issues, 17 and, again, looking back at that issue, is there anything 18 else we should worry about in the Smart Grid context?

19 MR. DASSO: Well, again, I think there's lessons to 20 be learned. You know, the wireless communications is one of 21 the components and elements that we have to think about. If 22 we're going to be talking with, whether they are Smart 23 Meters, or whether they're sensors or other devices, you 24 know, out distributed in the distribution system, depending 25 how deeply they go, the most economic, cost-effective, and California Reporting, LLC

safe, we believe, and many also believe, way to do that is
 through wireless capabilities. And I think we do have to
 make sure we're addressing consumers' concerns and answering
 those to the best of our ability.

5 COMMISSIONER WEISENMILLER: Okay.

6 MR. DASSO: Thanks. I think this goes back to 7 Angela.

8 MS. CHUANG: So we have a few technology readiness 9 road map examples to share. The ones chosen, for example, 10 because we have 19 of these in the final report, but we 11 decided to share the ones more on the customer side because 12 it reflects more of the newer capabilities of the Smart 13 Grid. For example, plug-in electric vehicle integration 14 technology readiness road map. Each stage here in the row is reflective of a certain level of capability and we start 15 in the short term, which means the next five years, so 16 17 through 2014, we move to the medium term, which is the next 18 five years after that, and then the long term means 2020 on 19 So, the first stage in this area of PEV integration is out. 20 going to be all about Smart charging, about handling the 21 vehicle as a load. So, the capabilities there include off-22 peak charging, demand response, down regulation as opposed 23 to up because it's about turning it off when it's on, it's 24 about managing the load from the electric vehicle when it's 25 charging. And then, the stage after that in the medium term California Reporting, LLC

1 with the vehicles to home, using the battery of the electric 2 vehicle to support electricity uses in the home, just 3 locally, and then, in the long term, getting vehicle to grid, which is using the battery, then also to be able to 4 5 also support the Grid, which involves another level of 6 complexity when we allow export of power to the Grid to 7 support it. And, finally, renewables integration, which is 8 about using the battery of the vehicle to support the Grid, 9 to balance fluctuations in intermittent renewable 10 generation, which is an additional level of complexity 11 because of the intermittent nature that needs to be handled. 12 So, those are the stages and the basic capabilities. The 13 enablers to reach each of the stages are listed on the 14 right-most column. So, for Smart charging, we need bidirectional communications, for example, between the grid 15 16 and the vehicle, standards to be able to support the Smart charging, and we need implementations to test standards and 17 18 so on. The vehicle to home requires bi-directional power 19 transfer on-board the vehicle, and a proven value 20 proposition to do vehicle to home. And you can see that 21 repeated, the proven value proposition to do vehicle to 22 grid, for example, is a key enabler in the long term, as 23 well as to support intermittent renewable generation. 24 Just some examples, the next one we'd like to share 25 is demand response readiness, integrating demand response, California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 what are the stages for that in the next 10 years. So, 2 today, we have reliability-based demand response programs, 3 that's part of the baseline. And in that, we just listed 4 here to contrast with the subsequent stages, so DR, Demand Response triggered emergencies, system emergencies, and 5 6 other critical conditions where the trigger uses is some kind of system-level emergency condition to trigger the 7 8 demand response. And we need - we do equipment retrofits, 9 we have to enable communications and remote control 10 capabilities today, we do that. And we have customer 11 adoption and program participation to increase program 12 participation as a key enabler. The energy market 13 integration is in the short term, where we have activities 14 today to get to integrating demand response with wholesale electricity - energy markets of wholesale electricity 15 16 markets. So, to do this, we need DR to be triggered based 17 on wholesale energy prices, so we're working towards that in 18 the day ahead, or day of, so energy-based trigger. And to 19 do that, the key enabler would be tariff approval for some 20 kind of dynamic energy pricing, energy-based pricing for 21 retail customers. And this requires two ways, smart end-use 22 devices - I'm sorry, one way communications for energy-based 23 triggering, one-way communications, not two-way yet. The 24 next stage in the medium term includes distribution 25 management system integration, where basically now we have California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 localized event conditions being detected and triggers based 2 on local conditions, let's say distribution system 3 conditions, so using demand response to support the distribution system, let's say preventing a distribution 4 5 transformer from overloading, for example. So, DR in this 6 stage can be used to extend facility and asset life, and PEV 7 charging is one example here, to avoid the transformer 8 overloads. We need Smart end-use devices with two-way 9 communications to get to this stage, as a key enabler. Ι 10 mentioned localized event triggers; also, tariff approval 11 for perhaps demand-based retail rates, and the PEV charging 12 is an example for that, where the value of demand is very -13 it's something that will need to be addressed. The 14 ancillary service market integration is also in the medium term, so we're talking 2015 to 2020, reaching this stage. 15 16 DR is providing operating reserves to support Grid 17 operations in this medium term stage, and to get to this 18 stage, we need Smart end-use devices with integrated 19 communications and controls, some kind of cost justification 20 for the telemetry requirements, the monitoring requirements 21 that are required by the Independent System Operator to 22 provide operating reserves. The cost needs to be justified 23 because the requirements are more stringent, or the 24 requirements need to be relaxed, or some combination, and 25 some cost allocation method if the market participant California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 decides to sell supply reserves using DR, for example. And 2 then, finally renewable integration, the most complex level 3 in this roadmap, we're not just using PEV, but any type of DR to help balance the intermittency of bulk renewable 4 5 generation, for example, or even distributed renewable 6 generation. So, to get to this stage, deep situational awareness, Smart end-use devices with the capability of 7 8 rapid automated response, that's in the long term - 2020 on 9 out. And we have one example on the Grid side, and many of 10 our technology readiness roadmaps, whether it be at the 11 distribution or transmission level of preparing the grid side, it has a basic trend of, we need the ability to 12 13 monitor remotely those resources on the distribution system, 14 for example, whether it be electric vehicles, or other types 15 of demand side resources, and have that capability 16 integrated with existing SCADA systems, for example, so that 17 the operators can make decisions, have the visibility, make 18 the decisions, and further down the line have the advance 19 protection control capabilities in place to operate the Grid 20 with these distributed resources, including customer-side 21 resources and intermittent resources, so the proper 22 protections and controls in place, then the ability to 23 operate with some level of automation and advance 24 applications, the general trend. 25 We would like to cover policy issues and

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

recommendations and conclusions and leave enough time for
 that, so our next speaker is Mike Montoya from SCE.

3 MR. MONTOYA: Good morning, everybody. My name is 4 Mike Montoya. I'm a Director of Grid Advancement for 5 Southern California Edison. And I want to talk a little bit 6 about what the team thought about as we went through this 7 whole process on the policy issues as we go forward between 8 now and 2020.

9 So, we broke it down into three different areas, the 10 regulatory role, who should be doing what, the deployment 11 pace, when you think about between now and 2020, in a couple 12 of weeks we're going to have less than 10 years to go 13 through all of this and really shore ourselves up such that 14 we can meet all of those goals and make sure the technologies that we use are capable of meeting those policy 15 16 goals. And then, the customer readiness, you know, it's 17 been alluded to that customers are going to be very very 18 important in this piece, there are a lot of goals around the 19 Smart Meter arena that are around demand response and other 20 issues that the customers are going to have to be very well 21 informed and be a part of this in order for it to be 22 successful.

So, around the regulatory role, we think the jurisdictional clarity is going to be very very important because of the fact that the Smart Grid is going to California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 encompass so much from the transmission level, bulk power, 2 wider controls, and distribution substation automation, 3 field area networks for our field workers, and asset 4 utilization, and all the way to the home area network where our customers are going to be involved. And when you think 5 6 about just the utility piece of that, there is so much 7 integration, and we think that end-to-end security is 8 paramount for that integration. And then, on top of that, 9 you hear folks, including the Chairman at FERC say that one 10 day I will be able to bid my washing machine into the ISO 11 market. And so, when you expand that into the millions of 12 devices, if that were to come to fruition, the integration 13 of this really needs to be at a national level such that the 14 standards are for all of us and all of the different manufacturers are all building to the same standard so that 15 16 we have an interoperable system and the capabilities for, 17 you know, like the computer world, where there is plug and 18 play.

19 And another issue around the regulatory role is all 20 the IOUs are in different places in Smart Grid, and that is 21 all driven by different business reasons, but as policies 22 are developed and as they move forward, that should be a 23 consideration such that it doesn't put one company in a bad 24 situation and another company in a better situation, so that 25 should be taken into consideration. And then our customers, 26 California Reporting, LLC

1 as we develop policies, they're all different, they all have 2 different needs, and so we need to at least have that Litmus 3 test to make sure that we're not doing something that was 4 really unreasonable from a cost perspective or technology 5 perspective for a certain customer that doesn't need those 6 different technologies. And then, the notion of least cost, 7 best fit, when you think about all these policies that we're 8 going to have to meet by 2020, we can do it brute force, you 9 can invest in different types of investment to try and do it 10 brute force, or you can look at it from a technological 11 perspective and see if the technologies will help us 12 accomplish those 2020 policies. And when you go into that 13 arena, you're going to be dealing with a lot of new 14 technologies, a lot of things that you'll look at in the lab, you'll look at when you first start deploying, but as 15 16 you scale that whole Smart Grid across your system and you 17 get more variable energy out there, you know, you may find 18 that it doesn't scale, or other issues as you go through the 19 technology, and so these thing will be the least cost - and 20 because there's going to be some uncertainty as we go 21 forward.

On the deployment pace, as I say, one of the areas that we think should be avoided is for regulators and others not to mandate or pick winners. In other words, we shouldn't be regulating one technology, or that one California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 technology vendor would have an advantage in that arena.
2 This should really be across the board, let the market and
3 the vendors, and the experts and the systems, look at what
4 the best fit and what technology is best for us to be able
5 to accomplish the goals.

6 And then, I kind of alluded to it before, but there 7 is a need for treatment of emerging technologies from a 8 contingency perspective when technology may not scale, or 9 technology may not perform like you thought it would in the 10 laboratory, or if you get out there and the generation or 11 the different technologies that are going to be interconnected with the Grid don't play the way you think 12 13 they would. And then, I think Kevin mentioned this, is that 14 we need to remember as we go through this thing, that we still need to have a reliable system and that we really want 15 to make sure that our customers are served properly with a 16 17 reliable service, while trying to achieve these goals.

18 And then, on the customer perspective, we need to 19 really make sure that there are incentives out there and 20 outreach programs that will really get them engaged to help 21 us meet these goals, they are going to be a big part of it, 22 and so we really have to ensure that they come along with 23 On the third-party access to this, I think everybody in us. 24 the room knows that there's a lot of other folks looking 25 into getting into this business, you know, you have the California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 Googles and the Microsofts of the world looking at how they 2 could maybe help our customers, you know, reduce their costs 3 through better information and technologies, so one of the 4 things we think is very important is that the customer 5 privacy issues should be very important as we develop these 6 policies, and make sure that the customer not only 7 understands what's going on, but agrees that their 8 information goes out.

9 And the last point is that the customer needs to 10 anticipate that the future electric costs are probably going 11 to go up because of the policy goals, but that if we do this 12 right, with the right technologies, and we're very 13 thoughtful about it, they will not go up as much as the 14 brute force way of doing things. And so, in summary, that's 15 just kind of the areas we think as we go through this whole 16 journey from now to 2020, these are the areas we think 17 should be kept upfront and in mind as we develop future 18 policies. Thank you.

19 COMMISSIONER WEISENMILLER: Yeah, Mike, a couple
20 policy questions. One of them is, obviously, as we rolled
21 out the Smart Meters, they've been more or less utility by
22 utility, and I guess part of the question is, are we at a
23 stage, you know, if you look vs. having meters rolled out on
24 a utility basis versus, say, nationwide, presumably the cost
25 would be driven down, the more we can get the common
California Reporting, LLC

1 technology. But then, part of the issue is, for this area 2 of innovation, you're not quite sure what the [quote 3 unquote] "winners" are. So, the question in part is, how do 4 we do the right balance between continuing to encourage 5 innovation at sort of the local level, while at the same 6 time trying to achieve some economies and cross 7 communication at the state and the national level.

8 MR. MONTOYA: Well, I think when you look at 9 technology, in general, manufacturers are going to build two 10 standards, and so if you have a national standard, you're 11 going to have a lot more manufacturers building to that than 12 if you have individual state standards, and the costs would 13 be much higher if you had individual standards because, you 14 know, they're building X for California and Y for Wyoming, and all that. So, I think it's important to keep that in 15 16 mind, you know, the manufacturers are going to build towards 17 standards and if we can have a standard that is 18 interoperable and goes along the way of plug and play, I 19 think that will help us with economies of scale and bring 20 the costs down.

21 COMMISSIONER WEISENMILLER: Good. Do you have a 22 sense of what a reasonable estimate of the timing to get 23 there will be on the national standards?

24 MR. MONTOYA: Well, it depends which one you're 25 talking about. We're working, all the utilities and all the California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 stakeholders are working on the standard for the 2 communications, for instance, on the Smart Meters, on the Home Area Networks, and so, you know, it's been worked on 3 4 for a year or so and it's probably going to be worked on 5 through the summer of 2011. We're anticipating that that's 6 when it will be finalized. But there are a lot of other 7 different areas out there that are being reviewed by NIST 8 and, so, each one of those individually will take its time 9 to get there.

10 COMMISSIONER WEISENMILLER: Yeah, I was going to ask 11 the harder question, if you think about what are the central 12 functions for Smart Grid, then the question is, when will we 13 have those standards in place for at least the central pieces of the puzzle? 14

MR. MONTOYA: Well, it depends on the technology 15 16 again, but if you look at communications standards, a lot of 17 those are already in place. If you look at communications 18 within the substations as an example of that, IEC 61850 is a 19 standard today, and utilizing that, which is our intent when 20 we move forward on our automation, so if you look at it from 21 that perspective and you pick the standards that are in 22 place today, and that they're interoperable, the whole thing 23 is interoperability here because you're going to have the 24 Home Area Network that's going to influence, you know, the 25 controls at the highest levels on the system eventually when California Reporting, LLC

1 you have enough penetration. And so, what we need to keep 2 in mind is interoperability and security as we go forward 3 with the technologies that we do.

4 COMMISSIONER WEISENMILLER: Just the last question, 5 in terms of Edison's distribution system, what are your 6 experiences at this point in terms of PV installations? Are 7 you finding it similar to Kevin? I assume you don't have as 8 many PV systems out, at least not as many affected circuits? 9 Is that right?

10 MR. MONTOYA: Yeah, that's correct. One of the 11 things that we do have that's a little different is we have 12 to install 100 megawatts of solar rooftop PV per year for 13 the next five years. And what we're finding is that the 14 roofs that are big enough to handle a one or two megawatt PV array are few and far between, and they're usually 15 16 clustered. And so, as we've looked at the queue of where 17 these PV arrays are going to be installed, or are proposed 18 to be installed, we're finding, you know, a 10 megawatt 19 circuit that as a queue in it with 21 megawatts of PV. So, 20 what we've done is we've actually developed some models and 21 we've done a lot of modeling of the PV inverters, we've 22 actually physically tested the inverters to verify the 23 models, and we're finding some interesting things like very 24 high voltages when the inverters and the solar are isolated 25 with the low loads, and so we're looking at what is the best California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

way to really achieve the controls that are going to be
 necessary for the higher penetrations of the solar PV.
 We're taking the view that we're going to try and make it
 successful to integrate all of that PV and other PV, so
 we're looking at tools to help us do that.

6

COMMISSIONER WEISENMILLER: That's great.

7 MR. MONTOYA: Okay, now I'd like to introduce Lee
8 Krevat from San Diego Gas and Electric.

9 MR. KREVAT: All right, thank you very much for 10 welcoming me here. I'm going to talk about some conclusions 11 and recommendations, a lot of which you have already heard 12 spread throughout not only this EPRI presentation, but the 13 earlier presentations from this morning. So, feel free to 14 ask questions if I need to clarify anything that I say or 15 that is up on the slides.

16 As we talked about probably that the main driver of 17 a lot of what we are doing in Smart Grid right now are the 18 energy policy goals, you know, all the IOUs have seen that 19 there are issues, even asking about distributed generation 20 and photovoltaics. At the end of 2009, we had 10 circuits 21 of our approximately 900 that have - this is just San Diego 22 - for example, 20 percent or more, with five having 40 23 percent or more at certain times of photovoltaics. So, we 24 are already seeing various types of issues. We're starting 25 to use different types of sensors, we have plans to use California Reporting, LLC

1 synchrophasors to measure what's happening so we have some 2 data with that, and we think we have a couple of solutions 3 coming online to smooth out that intermittency on the distribution level, although that is going to be harder to 4 5 do as it becomes more and more circuits over time. A second 6 driver that has really come on strong over the past year to two years is really empowering the consumers to take 7 8 advantage of more open markets, so, because the Smart Meters 9 are out there, we're approaching two million in probably a 10 month from now, but we'll take two million out of our 2.3, 11 so we're closing in on completion here. Our customers are 12 hearing more and more, and I think all IOUs have this, where 13 they understand that the data is out there, so now they're 14 starting to say, "What are we going to do with the data?" 15 Various consumer advocacy groups are asking, "What can we do with the data?" So, it's really driven very quickly Smart 16 Grid investment into that area and, again, all the IOUs are 17 18 working in conjunction to move in that area. I will say 19 what is exciting about the process that we did is that the 20 utilities, the major utilities in California, are all very 21 much, although we're doing different things and for 22 different reasons, because of what is evolving in our Grids, 23 we are in the same direction. There is nothing that we 24 absolutely disagreed about, it was really more fine tuning 25 to get statements we could all come to agreement on, and California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 that is a very good thing since we are trying to get 2 standards and not having to individually shoulder the burden of all of the advancements we're trying to make. I was in 3 New York last week and a New York Commissioner spoke about 4 no desire to go first, and instead to just look at 5 6 California. So I think it's really important that, while the rest of the country - it may not be moving like we are, 7 8 but we at least in California are in sync.

9 Another big thing to come out of not necessarily 10 just this effort, I'll give a lot of credit to the SB 17 11 effort to put together a Deployment Plan, is that in addition to the different utilities looking together, the 12 13 domains within each specific utility are working together 14 more than ever. Really, at the beginning of this effort, each domain customer, service provider, or transmission 15 distribution operations really looked at it from a very 16 17 within their domain perspective as to what they wanted to do 18 as they went forward. And as we're trying to build a 19 cohesive road map across the different domains, it has 20 forced us to get all the players together in the room and 21 talk about solutions and how they impact different domains 22 with the utility, and it's exciting to go from a few number 23 of people that really have that kind of broad knowledge to, 24 through discussion, having a much larger number of people 25 within the utility that understand how the different parts California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 of the utility work together.

2 And then, and you've heard the benefit areas that we've talked about, it is a concern of all of ours that 3 people might think that this is all going to be about cost 4 5 payback, and some of the projects will lower costs, without 6 a doubt, but many of the projects we're doing, you know, the 7 benefits lie in continuing to provide reliable energy in the 8 face of great change. And also, something that has been 9 talked about very much today is the national security 10 perspective of having distributed generation and being able 11 to leverage it in case transmission-based energy is lost in 12 some amount of time, also a benefit of the Smart Grid.

13 So, recommendations, you asked a question earlier, Commissioner, about how we avoid - this is how I interpreted 14 15 the question, you can correct me - at one point, we have an urgent need to move forward because we have these - our 16 17 customers have goals to be able to leverage their data and 18 save costs, we have the energy policy goals which are also 19 customer driven, as we've seen, and we have the reliability 20 goals out there, so our customers also, it looks like, and 21 in California we have a huge number of orders for Nissan 22 Leafs, I think about 40 percent are California, of all the 23 orders that were made, so this is really about the customer 24 and we do have an issue with - it's coming on fast, but we 25 don't have the standards in place. And, really, the answer California Reporting, LLC

1 there is to be careful and to start doing these 2 demonstration projects where we do try to get out in front 3 and understand how this is going to work, and I would caution that it's not going to be perfect, we are going to 4 make mistakes. I think each utility probably has some 5 6 directions they've moved in that they've had to back out of in order - because they went a little too fast, although 7 8 there were reasons that we went that fast, we had to solve 9 issues, so some of those solutions didn't work out as well 10 as we wanted, and we've had to re-do some programs, but we 11 want to minimize that. And even if you choose right, I'll 12 give an example, not the Beta Max VHS, I'll use VHS and CDs, 13 you know, so VHS was a standard, the price was driven down, 14 you could buy a VCR for under \$50.00, but still, eventually 15 came a better technology. So, we're never going to expect 16 that, just because we say something is a standard, it isn't 17 going to prevent a better technology to come along. So 18 we're going to see that also and that's going to create some 19 issues because where utility assets are there for a long 20 time, it's likely that, while we're happy with the 21 technology we've chosen, while it does become a standard, 22 that there might be following standards that we won't be 23 able to take advantage of as soon as we want because of what 24 we put in early.

> Also, I already pointed out, I guess the video California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 technology, if you look at number nine, as far as leveraging 2 experiences from other industries, so you really could look 3 at any industry where technology, digital technology, has come into play, and it's really totally changed that 4 5 industry, so we're certainly looking at Telecom, but we're 6 really looking at a number of industries beyond Telecom 7 where standards played a big role. Also, where competition 8 played a big role, we haven't talked about that much, but 9 it's certainly clear that advancements in technology from a 10 distributed generation perspective, storage, other energy 11 resources, fuel cells, for example, are going to bring some 12 - have already started to bring, and will continue to bring, 13 more and more competition to the energy industry.

14 So, really, again, I think as has been said a number of times, but the Smart Grid is not the energy policy, but 15 if we're going to meet the energy policy that we have, as 16 17 well as just customer facing empowerment policies and meet 18 our reliability goals, then we really need Smart Grid to 19 make advancements quickly, and by the way, we've put these 20 road maps together, but in our experiences, every time we 21 take a new look at our road map for the next 10 years, we 22 haven't pushed anything back yet, and things continually are 23 moving up. In the last year, we moved maybe 40 percent now 24 of our road map up five years. Two years ago, people 25 weren't talking about electric vehicles, they weren't California Reporting, LLC

1 talking about customer data, they weren't talking about 2 managing that with an iPhone and an iPad because there wasn't an iPhone or an iPad. So, this is really moving fast 3 and will continue to move fast, which is why we're not 4 really trying to make a prediction or a forecast of exactly 5 6 what this going to look like, but we are trying to put a 7 vision out there, a road map that we can use as a guide, 8 understanding that it's going to change a lot as we move 9 forward.

10 And then the last caution is just the three IOUs for 11 really good reasons are focusing on different aspects of the 12 Smart Grids, in some places we're looking at doing it the 13 same way, or similar ways, but I think that's good because 14 that also brings innovation and, when we see one of the other utilities do something, this is really - I should say 15 16 it's globally - we just met recently with Country Energy in 17 Australia, and actually it's them, that they have a 18 potential solution for the intermittency on the distribution 19 side, so I think it's healthy to talk to other utilities. 20 But within California, because we're kind of in the same 21 place, I will say, I know PG&E struggled with their 22 deployment, I think that, if you look, they have a lot of 23 customers now getting their data, looking at their data, 24 getting alerts, so it's also very positive story there if 25 you choose to look at the positive. And even another California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

positive, while it might not feel like it, PG&E, Edison, and San Diego Gas & Electric got to look at results based on how they did certain things, and we were able to learn from it. And I think that we have to all be open to sharing our mistakes so that we can learn from each other and not repeat them.

7 COMMISSIONER WEISENMILLER: Thank you. I have three 8 areas I want to talk about. One is, of the Nissan Leaf, 9 what percentage of those are in San Diego? My impression is 10 you guys are really focused on trying to be a leader there. 11 MR. KREVAT: Yes. So we have an approximate number from Nissan, they have not committed to this number. And 12 13 they may deny giving it to me, but approximately 2,000, so 14 about 10 percent of the Leafs nationally. I know that, supposedly, on the 23rd of December, or next week, there's 15 16 another shipment coming of Leafs down to San Diego and 17 another one soon after that.

18 COMMISSIONER WEISENMILLER: And how are you dealing 19 with the potential for multiple vehicles on a single 20 circuit?

21 MR. KREVAT: Yeah, so, when I was ordering my Leaf, 22 my daughters were with me and my teenager, who is 17, who 23 I'm looking for a used car for said, "Dad, get me one also." 24 So it wouldn't have been the same, you know, transformer, we 25 live in the same house, and I was telling that story to a 26 California Reporting, LLC 27 So Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 San Diego organization, and the head of that organization 2 said she was looking at buying two, as well. So I think these are real issues that are going to happen and what 3 we're doing now is we're actually leveraging the Smart Meter 4 5 data that we have hourly, so we're looking at a transformer 6 and the meters that are attached to that transformer, adding 7 up the hourly data hour by hour, and therefore building a 8 load profile for each transformer. And from that, we have 9 already gotten data that shows some transformers on the 10 hottest day of the year are over 200 percent capacity 11 already, a number are at over 150 percent. So, if you look 12 at that data, and then you're aware of an electric vehicle 13 and someone signs up for an EV rate, calls us up as part of 14 the process, then we'll be able to apply that predictive data to that load profile on a hot day and see where we're 15 going to have issues. And luckily, even though there are a 16 17 lot coming, we will have some time as it ramps up to learn 18 and continue to improve the process.

19 COMMISSIONER WEISENMILLER: Good. Another question, 20 a lot of the electric system historically has had 21 depreciation over many decades, depreciation schedules over 22 many decades, and still in use 50 or 60 years later, where 23 obviously your iPhone or whatever has got a much shorter 24 life. What sort of depreciation schedule are you using for 25 the more computer electronic aspects of the Smart Grid? Or California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 what would you suggest?

2 MR. KREVAT: Okay, that's a difficult question. What we are trying to - we have a project called "Grid Com" 3 which is basically a wireless cloud over San Diego, and so 4 we're trying to build it out so that the communications 5 6 aspect is modular and depreciate that over five to seven 7 years, whereas the parts that we expect to last longer were 8 depreciating over a more traditional length of time and in 9 some areas we can't do that, and with the Smart Meter, 10 that's difficult to do the Smart Meter, I think it's a 17-11 year depreciation on that product. 12 COMMISSIONER WEISENMILLER: And I guess, 13 historically, it was about 30 for the old meters? 14 I believe so. And the software on the MR KREVAT: back end, that's more of the - I think we're going for seven 15 16 or 10 years on the software on the back end, and the 17 hardware five years or seven years for a refresh, so 18 different aspects of the system, different timelines. 19 COMMISSIONER WEISENMILLER: That's good. Obviously, we've looked at lot at Smart Grid implications for the 20 21 electric system. As a joint gas and electric system, you 22 know, is there any synergism here with your gas pipeline 23 system and distribution system, elements that you can and 24 should be rolling out there? 25 MR. KREVAT: And so we're investigating that now, California Reporting, LLC

1 especially, again, with Grid Com coming into play, we'll 2 have communications systems. So, we're looking into how we 3 can leverage technology. If you look at the definition, it could apply to gas, we're just trying to find some of those 4 5 positive benefit implications for our customers, trying to 6 identify those. But we already do have a piece, our gas -7 in order to get the benefits from not having to read meters 8 manually, we have gas modules on our gas meters that 9 communicate with the electric meters. So, in a way, we're 10 already having it touch our gas system.

11 COMMISSIONER WEISENMILLER: I was at a hearing last 12 week in San Bruno on that incident and I was trying to 13 figure out also if there are any implications of Smart Grid 14 for those types of concerns.

MR. KREVAT: Well, I will say we are looking - I can't go into details because we haven't really figured our investigation, but we are looking at how to be able to measure more remotely and respond to things, you know, leveraging - again, it's about applying digital technology to the Grid. And that could apply to other grids, as well.

21

COMMISSIONER WEISENMILLER: Okay, thanks.

22 MR. KREVAT: Thank you.

23 MR. GRAVELY: So we have a few minutes, if there are 24 burning questions in the room here, I would say for online, 25 if you have questions and would type in the questions, we 26 California Reporting, LLC 27 S2 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 can potentially address those at the very beginning of the 2 second hour after lunch. Is there anybody here who would like to talk to the utilities or Angela about their project 3 at all? Okay, we'll break for lunch. If you have 4 questions, give them to myself or Suzanne, maybe we'll start 5 6 with just a couple questions beginning at the next session, but we'll come back and we'll hear from -- after lunch at 7 8 1:00, we'll reconvene and we'll hear the other two 9 technology road map statuses. Thank you very much. 10 (Off the record at 11:59 a.m.) 11 (Back on the record at 1:06 p.m.) MR. GRAVELY: Go ahead, Merwin. 12 13 MR. BROWN: Okay, thank you. I'm Merwin Brown with 14 the California Institute for Energy and Environment with University of California. And the question I'm asking 15 combines a number of points that I heard in the 16 17 presentation, so it doesn't necessarily go to any one point. 18 And what's behind this question is trying to get a sense of 19 the urgency for the development of new technologies for the 20 Smart Grid, and perhaps this also goes to the need for 21 changing certain policies, but that's not my direct 22 interest, it's the new technologies in order to meet the 23 State's energy policy goals, particularly renewable 24 integration by 2020. And there were some points made that 25 I'd like to follow-up on. One of them was that, in the road California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 map, it showed demand response not really being utilized 2 until after 2020. And also, a comment was made that, if we 3 had to, we could meet those goals with brute force which I interpret to mean sort of we would build our way out of this 4 5 problem with the traditional transmission lines, 6 distributions lines, traditional power plants, using traditional old technology. And I guess I would ask the 7 8 question, how comfortable or confident are we that, one, we 9 won't need demand response before 2020, and that we won't 10 need these other new technologies, that we will find it 11 increasingly difficult and expensive to try to build our way to meeting the 2020 goals? And, again, I'm asking the 12 13 question in the context of is there a sense of urgency that 14 perhaps the road map doesn't bring to bear on new technology 15 development.

MR. GRAVELY: Angela can help me, but I've read the chart to say that the DR's ancillary service was in your five to 10 year window, not your after 20-year window, so it was a medium - not a short term, but a medium, so it would still be prior to 2020, but not necessarily right away. Is that correct?

22 MR. BROWN: I'll take the demand response out of the 23 question, but I still have the one about the brute force. 24 Can we build our way out of this problem? 25 MR. GRAVELY: Right, so anybody want to address

California Reporting, LLC

1 that? So I'll help a little bit from my exposure with them 2 before, and that is, I think we realize from the California 3 perspective, permitting and other things, that the brute force approach will work only in a dire emergency and a 4 5 small amount of the problem, so I suspect we will - and 6 Commissioner Weisenmiller, I do think over lunch your 7 question about the vision, and I would say, as we go into 8 the next presentation, I think the piece that I saw that 9 wasn't clear there was the desire and a vision of the Smart 10 Grid creating opportunity for commercial growth, creating 11 opportunity for new products, and encouraging the expansion and growth of the commercial market, so we're going to 12 13 actually start now hearing a little bit more from the 14 vendors and the commercial side, but I would say most of the 15 vendors I've talked to, if we developed a vision in the 16 state, they would like that vision to include a desire or a 17 goal to open the market up for competition to allow 18 commercial products to grow and thrive, so that we actually 19 take that extra step, as opposed to just take what comes. 20 And with that, I'd like to turn it over to, I guess, David 21 is speaking today here? There are a couple of people here 22 from the Jet Propulsion Lab. So a reminder in this case 23 that they're about half way through their contracts, so they 24 have begun research, they are holding many of the technical 25 discussions, and they have begun to formulate their California Reporting, LLC

information, so you have the ability to influence them, but
 they may not have all the answers to questions you have.

3 MR. TRALLI: Thanks, Mike. It's my privilege to represent the perspective of the manufacturers and vendors 4 5 The title of our project as we proposed it was on our team. 6 "Road Mapping the California Smart Grid through Risk Retirement." Risk Retirement is a term that we used in the 7 8 Aerospace industry to define the set of actions that one 9 must do in the course of a program or project to mitigate or 10 move those risks to your requirements, to meeting your 11 requirements. So, one of the things I want to say before we 12 get started is how do we know as a community that we have 13 met our goals of 2020? How do we know that we've met our 14 goals of 2020? How do we know that we have the Smart Grid that we thought we would? And how do we know over the next 15 16 decade that we're making progress towards meeting that 2020 17 Smart Grid?

18 So, I'm proud of listing everybody who contributed 19 to this study because it shows the amount of interest that 20 we have from this community in giving their perspectives to 21 what we were doing. It was our responsibility as a project 22 lead to gather all this information and put it in a manner 23 that makes sense and that is quite a challenge and we are in the middle of that. We've held three workshops, one in 24 25 Pasadena, one in Sacramento, and one in Washington, D.C., California Reporting, LLC

1 and we have an incredible amount of information. A lot of 2 these companies were members of our trade organizations that 3 are part of our project advisory committee through the American Council on Renewable Energy and the Electrical 4 Manufacturers Association, and then also the Gas Technology 5 6 institute. So, what we have here is some preliminary findings and recommendations from what we've been able to 7 8 put together for the purposes of today's joint workshop.

9 The Commissioner asked a question at the beginning 10 that we share the view that we have to offer a definition of 11 Smart Grid in any conversation or presentation on Smart 12 Grid. This is the one that we went with in our proposal 13 which is attributed to Austin Energy: "Smart Grid is the 14 seamless integration of electric grid, communications 15 network, and necessary software and hardware to monitor, 16 control, and manage the generation, transmission, 17 distribution, storage, and consumption of energy by any 18 customer type, industrial, commercial, residential." But 19 more than that, for us, it also encompasses the integration 20 of renewable energy and electric vehicles, and also reflects 21 the importance of appropriate policy, regulations, and 22 standards.

23 Now, while I will not talk specifically about policy 24 and regulations, I will say that our first workshop back in 25 June, most of the time of that two-day workshop, was spent California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 on looking at issues and barriers related to regulations
 that might get in the way to meeting these targets, and that
 will all be part of the final report.

4 So the landscape, as we see it is this, that major 5 changes are need in the electric and the natural gas 6 infrastructure to meet the anticipated energy needs and to 7 address climate issues in the next decade and beyond. The 8 key point in natural gas is the fact that it is a major 9 component in the distributed generation space, and we'll 10 talk about that. The concept of the Smart Grid is driving 11 the development of advanced energy conversion, storage, and reliable power delivery technologies and also the 12 13 integration of renewable resources and more efficient grid 14 operations. And this last point, that clean transportation and greenhouse gas emissions from the grid itself also 15 16 forces us to examine our efficiency and consumption 17 considerations, this points to the California loading order, 18 that you don't just look at clean supply, that we need to 19 start by reducing consumption and garnering greater 20 efficiencies.

Our vision is this, luckily this wasn't a business school exercise of seven words or less: "Reduction in energy consumption and greenhouse gases from electricity production and clean transportation are linked to provide electricity producers, distributors, and consumers with California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 options for their preferred business models and operations 2 choices, means that we need to have sustainable, cost-3 effective, secure, and reliable solutions that not only must 4 be developed, but demonstrated in the field, matured, and 5 then implemented." So, we start pointing to the natural 6 progression of technology maturation and technology risk 7 reduction through the demonstrations and scale-ups so that 8 we can engender commercialization not only first year risk 9 reduction by the Government and the State, but also 10 investment from the investment community. 11 We feel that a new paradigm is evolving where 12 generation, storage, and control are more distributed, along 13 with attendant modification to grid interconnections. 14 Commissioner had a lot of questions on distributed generation, which we'll talk about. And in terms of 15 enabling that distributed generation, we feel that 16 17 microgrids are at the heart of this paradigm, providing co-18 generation options with integration of renewables, including 19 rooftop PV systems and combined heat and power, while also 20 enabling options for reduced consumption through such things 21 as demand aggregation, distributed storage, EV 22 accommodation, and ultimately net zero buildings with the 23 2020 residential target. This will ultimately lead to a 24 Smart Grid that provides the ratepayer with a greater voice 25 in energy flexibility, efficient operations, and cost California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

structures. Some of these elements have been touched upon
 in the morning sessions.

3 So, in terms of generating our baseline for 2020, there were some key technologies which I'll list in a couple 4 5 of slides that we asked our project members to define for 6 us, not only the current state of technology, but what 7 technology is going to be in 2020, and how do we get from 8 2010 to 2020. It's what they call their current state in 9 these various key technologies that we're defining as part 10 of our 2010 baseline. I won't read them all, but solar and 11 wind integration, on the solar side, we have the CSI, you 12 guys can look this up in the presentation package, in demand 13 aggregation you have some very early projects in net zero 14 buildings that touch a little bit on that, or demand management zones, which we'll talk about later. 15 Distribution automation, there is a lot of proprietary 16 17 products developed by a small number of OEM's, and there's 18 research needed to see how much this AMI with all these 19 meters out there can be suitable for stretching distribution 20 automation applications beyond the substation, more to the 21 meter part. Government is leading a lot of the development 22 of standards and the control and protection products and 23 deployment like transmission communication systems and AMI, 24 and these are snapshots from our project team.

EV accommodation, there is a lot of technology California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

25

1 factors and a lot of load impacts that have been mentioned, 2 and a lot of this needs to evolve, it obviously needs 3 advancements in battery technology, charging infrastructure, and also that communications and control that enables the 4 5 accommodation of EVs on the Grid. In net zero construction, 6 you have the start of distributed generation at the 7 community residential level, energy efficiency, tax credits, 8 distribution generation, energy efficiency, AMI and control, 9 again, for proprietary products, by a small number of OEM 10 vendors, some source proprietary technology by smaller 11 numbers. A lot of discussion on bandwidth issues and mesh networks and options there, and the communication space, 12 13 large and small vendors, government leading standards, and 14 customer benefit is not really clear.

And then microgrids, three different scales, 15 substation level like in the Maui project, feeder level like 16 17 DOD 29 Palms with GE, multi-facility direct load control, 18 and single facility, like a project going on in British 19 So, we can start seeing things happening, but our Canada. 20 message really, as you'll see, is that we need to look at 21 the Smart Grid as a system, and see how we can better 22 integrate all these demonstrations and stuff towards meeting 23 the 2020 target. Lastly here, storage. There is some 24 storage starting to meet daily electrical demands, energy 25 storage is derived from the shifting of energy production California Reporting, LLC

1 from load demand periods to high demand periods, pumped 2 hydro-compressed air, steam generator options, and we need 3 development of more options for large-scale stationary storage and lithium ions, ultra capacitors, flywheels, there 4 is a flywheel company in California, a recipient of Stimulus 5 6 funding, in Mike's list, in his presentation, flow batteries. So, that's kind of our snapshot of some key 7 8 technologies 2020.

9 In terms of microgrids, our definition of microgrids 10 really refers to a document, a CEC report of 2007, a joint 11 workshop between CEC and Department of Energy in 2007, where the microgrid was defined as an integrated power delivery 12 13 system consisting of interconnected loads and distributed 14 energy resources, often with its own storage. This connects with the Grid or macro-grid, so you have an interconnect 15 16 there, integrated DR, it's capable of providing continuous 17 energy to a significant portion of the internal load. The 18 Grid possesses independent controls and can island from the 19 larger Grid. I think there is a lot of discussion of 20 options of the Microgrid as an architectural option for what 21 we're trying to accomplish. The Microgrid is an 22 architectural option for enabling distributed generation. 23 It's an option for modularity, for introducing technologies out of modular levels so that we can then replace them with 24 25 more advanced technologies as the years go on, as Lee California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 pointed out from San Diego Gas & Electric. It also offers 2 more control, possibly more of a security risk, maybe it minimizes the number of interconnections with the Grid, but 3 I think another interesting thing that we need to look at 4 with microgrids is from the point that Mike mentioned when 5 6 he introduced me, which is from the perspective of 7 generating new business and new market opportunities and 8 capabilities that we can develop in the state as a fleet 9 leader not only for the nation, but exporting capabilities 10 that we know in the Third World and in other parts, 11 microgrids are the way that they're going to go because they don't have the old electric power infrastructure that we 12 13 have in this country, that we have to maintain, while we 14 also re-architect things to meet a 2020 goal.

15 So this report is available online, I recommend that you take a look at that, it's 2007. How do we get there? 16 17 This was the key question. The Smart Grid we recognize is 18 an engineering system whose complexities not only span 19 technological and operational issues, but obviously policy, 20 regulatory market, and social factors. And the discipline 21 that we're trying to bring into this study and onward is to 22 plan for the design development, deployment, and 23 sustainability, by looking at what those top level 24 requirements of the Smart Grid are. Those top level 25 requirements are given to us by the IEPR, okay, and we'll California Reporting, LLC

1 get to that. So, advanced energy conversion storage,

2 reliable delivery, renewable resources, clean

3 transportations in the form of EVs are all integral to that system architecture. And we must not forget that the 4 5 expectations and benefits to the ratepayer must also be part 6 of that optimal solution. So the risk retirement is a 7 system level enterprise that we need to do through an 8 integrated series of key demonstration projects. We're 9 going to start in the next three years by looking at the 10 progress of all those projects on Mike's list that are 11 taking place in California, a lot of those are in placement 12 of advanced meters, some of them are energy storage, there 13 is one that is looking at flywheels, and we need to see 14 where all that stuff takes us and to find over the next 10 15 years what additional risk reduction demonstrations we need 16 that tie back to all the objectives that we have from the 17 IEPR, so that we know we're getting to where we need to be 18 in 2020. So, these demonstrations are to identify, 19 prioritize, mitigate, and systematically buy down the risks 20 of key technology and Smart Grid subsystem areas, and it is 21 for validation and verification of integrated systems within 22 the Smart Grid. Not only did you ask the question, did we 23 do what we wanted to do, but are we doing the right thing to 24 get to 2020 and beyond? So, these demonstrations,

25 assessments, and evaluations look at technical performance California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 and cost, they look at controls and interfaces,

2 interoperability, they look at the possibility of scale-up, safety, reliability and security, codes and standards, 3 business model feasibility for the utilities, for the 4 5 vendors, for the consumer, market transformation needs, and 6 the leveraging between applications. And again, as was mentioned earlier, the lessons learned, lessons learned 7 8 amongst and between utilities, technology developers, and 9 the ratepayer. We benchmark, we develop best practices, we 10 learn from that, and we march to the 2020 target and beyond.

11 So, as part of our study, we designed a couple dozen 12 questions that we offered to ACORE on our project advisory 13 committee and they distributed this to their membership, 214 14 people participated, and these are just a sample of the 15 questions and the answers that came from that membership 16 survey. The greatest barrier to establishment of the Smart 17 Grid, 1) lack of consumer knowledge and education; I think 18 we've seen that before; potential loss of consumer autonomy 19 and control, that was a concern; not enough financial 20 incentives, which of course we know; and then, no regulatory 21 In the interest of time, I won't read these regulation. 22 sub-bullets, but we can talk later, you obviously have a 23 copy of the presentation online. What are the three most 24 important technologies for Smart Grid implementation and 25 why? Control and communications, of course, is big; California Reporting, LLC

1 advanced metering infrastructure, which of course we are 2 moving forward with that; and then, the integration of 3 photovoltaics and wind, and storage for firming up 4 intermittent resources.

5 Study approach. Basically, as the project lead on 6 this, we wanted to rely on the input of a wide range of Smart Grid technology manufacturers and vendors through a 7 8 series of workshops and surveys, and continual e-mail and 9 exchanges and discussions, and to develop the top down 10 system engineering approach to road mapping or proscribing 11 what the key actions need to be to meet the objectives. Ι will share with you key technologies and use cases. We've 12 13 held some workshops and the underlying engine of process to 14 what we're doing, which we're not going to talk about today, is that Risk Retirement approach of understanding, what are 15 our high level objectives, which are coming, and you should 16 17 know them, and we listed it through workshops, what are the 18 risks and barriers at all levels? Physical, functional, 19 market, operational, regulatory, okay, that are in the way 20 or potentially in the way of meeting those objectives, and 21 then what do we do to mitigate those objectives in time so 22 that the more we beat down those risks or buy down those 23 risks through demonstrations, the more we know that we are attaining the objectives set forth. 24

> So, the key technologies that came out of our California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 workshops were storage, rooftop PV, demand aggregation, the 2 biomass base CHP, microgrids, CCUBE, Command Communications 3 and Control, distribution automation, AMI, EV accommodation, and integration of solar and wind towards meeting the RPS 4 5 targets. We defined six use cases which are the core of 6 maybe defining some interesting, or pulling together some interesting future demonstration projects around the role of 7 8 natural gas and DG for CHP, combined with biomass, looking 9 at command and control, and distribution automation, 10 including what we can do with AMI, communications and 11 control for the accommodation of plug-in hybrids and plug-in 12 electric vehicles, biosources, biomass as part of the RPS 13 target with a proscribed target for biosources and for fuel 14 cells for energy storage and working with CHP, and then large scale storage to firm up wind and solar. The policy 15 16 goals are these nine - it's kind of funny that there are 17 question marks - those should be 1 through 9, that's not me. 18 So these are the ones that we pulled out of the IEPR, these 19 are the ones that the top down system analysis speaks to. 20 We have to do things that we can link through our system, 21 have something to do with doing a better job of attaining 22 these objectives to 2020 and beyond. And then we also 23 looked at six additional objectives that came out of a DOE 24 study for their Smart Grid work, but we're really speaking 25 to these top nine here.

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 So what we did here, and we can talk about this 2 later, we have the charts up on the wall behind the 3 Commissioner, but what we wanted to do was develop a framework for our roadmaps, and I think somebody, I think it 4 5 was Angela that said, you know, we have road maps for 6 different technologies. I don't think we're going to have a 7 singular roadmap because there's going be a series or suite 8 of roadmaps where each one of these key technology areas are 9 core components of the Smart Grid system. But what we did 10 is identify the fact that we have the reduced consumption 11 side, and then we have the clean supply side, okay? And that pays attention to the loading order in the State. And 12 13 down the middle comes the existing infrastructure, this is 14 a timeline from left to right. Down the middle is the existing infrastructure of the electric grid and the natural 15 16 gas distribution grid. And so, what we noticed was that out 17 of those nine objectives, there are not nine independent 18 objectives, they are nestled, you start with number one as 19 33 percent RPS; we have small hydro, we have geothermal, we 20 have centralized PV, centralized wind, we have biomass, but 21 now within that, there's a specific target for biomass in 22 the IEPR, and there's a specific target of 5.4 gigawatt 23 increase in CHP, and the biomass is linked to the CHP, and 24 the CHP is linked to natural gas to supplement biogas 25 generation. And then you have rooftop PV. Rooftop PV is California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 part of reaching a solar renewable target, and so these PV,
2 CHP, biomass, are increasingly distributed, and how do we
3 enable and accommodate those distributed energy resources
4 into the utility grid? Well, one architectural option is
5 microgrids, and that is something we want to look at.

6 On the consumption side, or demand side, there's 7 overall reduction target, a target and reduced consumption 8 overall, there is reductions in peak demand, there is the 9 ability to meet that peak demand through demand response, 10 either dynamic pricing signals, voluntary programs, or 11 something exercised by the utilities. Then, you also have 12 efficient production, distribution, net zero construction, 13 this notion of demand management zones, net zero 14 construction that is kind of stalled right now because of the state of the real estate market and the economy, so we 15 need to understand where these things are going to start 16 17 happening and how they're related. And then you have EV 18 accommodation. EV accommodation that will put a load on the 19 grid, EV for resident storage, for frequency regulation, how 20 is this all going to play out, and how do we accommodate 21 electric vehicles? And microgrids, multiple scales -22 commercial, industrial, residential. Where do we need to do 23 Risk Retirement demonstrations so that we know that these 24 demonstrations address multiple targets, and one 25 demonstration is linked to the other and related to the California Reporting, LLC

1 other, and make an assessment midstream, like five years 2 from now, to see how we're doing, where do we need to re-3 architect, and where do we move forward on to 2020?

4 So, the preliminary findings were that barriers 5 cited by our industry partners are not exclusively 6 technical, they are economic, financial, regulatory, and 7 social. Stimulus funding is good, but it's not enough to 8 overcome the lack of capital needed for large scale 9 deployment. Distribution grids are not set up to evolve 10 into grids or microgrids, there will be increased 11 opportunities for physical attacks, modularity, microgrids, 12 breaking up the grid into smaller chunks affords you a lot 13 of benefit on one hand, but also introduces other portals 14 for cyber threats, so that needs to be traded off. Time of 15 use retail pricing changes that interface between retail and 16 wholesale market systems, and then Smart Grid system models 17 that look at all the stakeholders are badly needed. I think 18 it was Recommendation 6 out of SDG&E that said we need to 19 look at architectural options and look at things as systems 20 to systems, we couldn't agree more. And there is much 21 development needed in storage.

Energy storage is needed for a variety of Smart Grid applications, peak shaving, bar support, renewable energy integration, electric vehicles, frequency regulation, and islanding - islanding, that is another benefit, perhaps, California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 that if you have a potential brown-out or something, you can 2 maybe control it in near or real time from cascading by just breaking things down in to localized load and supply 3 domains. Distributed generation in combination with 4 5 distributed storage offers many opportunities to achieve 6 greatest efficiency and operational benefits. Biomass for reducing greenhouse gasses, and the interplay with that, 7 8 with natural gas a clean fossil fuel in the CHP, and the 9 impact and benefits of electric vehicles. I will move on. 10 This was through a discussion with folks we know at General 11 Motors, the primary goals of OEM's, of course they have to 12 develop a product that is saleable and welcomed in the 13 marketplace. Everybody knows that we want to reduce our 14 dependency on oil and reduce greenhouse gas emissions, there is the whole issue of charging standards and interfacing 15 16 with the grid.

17 Impact on the grid - you must integrate with the 18 Smart Grid infrastructure with minimal effort and expense, 19 so there is a lot of communications and control issues that 20 need to come in there, on top of the issue that we talked 21 about earlier, which is, if the electric vehicles are very 22 clustered, they put a load onto the circuit, that creates a 23 problem, so how are we going to manage that. And other uses 24 for EV's, I won't get into this because I'm probably out of 25 time soon.

> California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 Let's see, Incentives. We need to incentivize the 2 consumers to engage in Smart Grid related activities, maybe 3 some joint projects between the ratepayers and utilities, utilities and industrials and commercials, conduct studies 4 5 and analyses, education campaigns, we saw that earlier 6 today, conduct additional demonstration projects for Smart 7 Grid functions and Smart Grid elements under the context of 8 a complex system, microgrid demos of which there are some 9 already in-state. Let's see, ensure that regulations do not 10 unbalance value propositions, EERS for the net zero issue, 11 and others here. So, these are all documented. Energy 12 storage, lack of appropriate energy storage was the most 13 frequently mentioned technological barrier towards meeting 14 the Smart Grid related goals by supplier representatives at 15 our workshop, that's how we would use storage. 16 Recommendation - California should undertake a 17 carefully planned campaign to address the need for language 18 updates and tariffs and standards to ensure proper 19 evaluation of storage and a range of Smart Grid

20 applications. Let's see, energy storage - incorporation of 21 energy storage and microgrid operations, coupled with 22 microgrids, and then looking at this. Let me mention that, 23 on the electric vehicle accommodation, our lead for that was 24 General Electric, who also provided some stuff on the 25 communications and controls for accommodation for Electric 26 California Reporting, LLC 27 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 Vehicles. National Electrical Manufacturers Association 2 took a cut at distribution, automation, and demand 3 management zones. We have A123 Systems on the team that helped us with some of these stationary storage barriers and 4 5 ideas, Fuel Cell Energy on the combined heat and power space 6 for load following stuff, base load, supply, and I'll show 7 you a representative example. Gas Technology Institute also 8 on the CHP and microgrid arena, Sun Power on the rooftop PV, 9 and a host of others that were part of Slide 2. Microgrids 10 -- very much interested, the industry participants in the 11 project, in looking at the microgrid as an architectural 12 option for meeting the California goals. And there is some 13 stuff in there that I certainly would like to understand. Ι mean, does the microgrid - I'll just throw that out there as 14 a question - are there architectural options that engender 15 16 more business than market development opportunities for the 17 state and attendant job creation and capabilities for 18 manufacturing in the state, that can also be exported 19 nationally for the national grid, and abroad across the 20 Pacific where there is going to be a lot of growth in this? 21 So, it's another, you know, architectural options are not 22 just technical and physical, okay, they are functional, 23 operational, market driven, economic, and so, when you do 24 the tradeoff analysis, you're not just focused on technical 25 performance and cost, but all these other issues, and so is California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 this an architectural option that would leverage more of the 2 things that we're trying to do?

3 Microgrids are inhibited right now from growth because of the readiness of the consumers, system knowledge, 4 5 the need for more system architectural trades, 6 recommendation 6 of the EPRI Report, stuff that we're trying 7 to do here, energy storage, looking at issues and 8 regulations and standards for communications, 9 interoperability, and the availability of financial 10 arrangements. Okay, stimulus funding is good, it reduces 11 the first tier of risk and technologies that need to be 12 rapidly commercialized, marketed, and scaled up, so what are 13 the analogs to clean technologies, to biotech and IT of the 14 previous Silicon Valley runs that the state has had? We need to understand that, okay, and that is part of the 15 trade-off space, as I mentioned last. And, again, lastly, 16 which was I think mentioned in the modularity discussion by 17 18 Lee and I think alluded to by Merwin as understand that the 19 Grid and the technology that supports it is not static, 20 things will be evolving, technology will be maturing, and 21 how do we best do that and not lock ourselves into options 22 right now that are going to be costly to replace, albeit 23 better in the future as we move to 2020? And microgrids for 24 looking at operational efficiency, and maybe some customer 25 benefit issues of microgrids that are worth looking at, and California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 the details are - and microgrids, here you go, maybe this is 2 the system of systems, okay? You have nuclear base load, 3 remote solar, remote wind, hydropower remote, with some 4 microgrid options more at the industrial, commercial, 5 residential level, integrated with the utility, third-party 6 ownership, controls, interconnections, all that stuff needs to be worked out, but those are the things that we would 7 8 recommend be looked at. Demand Response - no clear cut 9 ownership preference, utility, customer, or third-party 10 demand aggregator, this came out of discussions in our 11 workshops, and we need to carry out further studies to see if further actions are needed to focus on investment and 12 13 development efforts to define specific forms of demand response management - who is responsible for it, what are 14 15 the best ways of addressing market forces there? And then, 16 this is just an example provided to us by Fuel Cell Energy, 17 putting together capabilities that address base load and 18 address load following capabilities to firm up wind on one 19 side, but to use the wind power to maybe electrolyze the 20 water, generate hydrogen as a storage option, and that also 21 takes hydrogen co-generated from a larger scale biogas 22 facility, and use that to feed the load following system, or 23 instead of the electrolyzer, you can put a stationary 24 battery system. What I like about this demonstration, if 25 you look at the checkmarks, is that it allows you to California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 integrate intermittent resources, it helps you meet that 2 number one target. It provides flexible fuel options, not 3 only on the renewable side, but it's a play for natural gas, 4 which we're trying to accommodate. There's no fuel 5 consumption in the spinning reserve state, it reduces that, 6 it's efficient, it's zero emissions goal number nine, 7 bringing back our GHG's to 1990 levels, it offers a rapid 8 load following capability of distribution automation, super 9 peaking, distributed gen, so these are the kinds of projects 10 and systems - I'll use that word, systems or components, 11 that we need to look at, so that we're not just looking at 12 storage, or we're not just looking at one piece, but we 13 start looking at integrating what we need to do, so that we develop the California Smart Grid as a system in the next 14 15 decade. This is where we're at. We're going to explore 16 deeper in two or three architectural options and look at 17 some key system tradeoffs, space domains like the biomass, 18 CHP, industrial scale, 10 megawatt microgrids, look at 19 hydrogen for storage, fuel cells, or even for transportation 20 for that matter, and demand aggregation, demand management 21 zones that the commercial, residential, microgrid area, net 22 zero buildings, there is some interesting stuff coming out 23 in the press from Wal-Mart and their interest in microgrids 24 and putting systems on their roofs and parking lots, which 25 is really intriguing, electric vehicle accommodation, the California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 command control structures there for the additional load for 2 using that as additional storage for frequency regulation. 3 What we're trying to do also in the second bullet is, some 4 of these objectives from the IEPR are very numeric, you 5 know, 33 percent, well, we can go back and look at the 6 database at the state, we know how much we're generating from renewables, and we know how much we're using biomass, 7 8 and we know what we're doing in CHP, so, as you're moving 9 forward, we need to know the systems that we're putting in 10 place and maturing into the grid, we need to know how much 11 energy we're supplying with that and we need to know where 12 the demand is, and so we're trying to put together a model 13 that allows us to say that we're retiring the risks and 14 those risks are linked to those objectives, it points to actions or activities that we know in an energy balanced 15 16 sense how much energy we're putting in CHP, biomass, RPS, solar rooftop, how much we're reducing consumption, how much 17 18 we've reduced peak demand, things like that. So, we're 19 exploring that, and then we're going to offer a 20 recommendation of Risk Retirement demonstrations that 21 integrate various key technologies like I've listed, and a 22 suite of key technologies that address more than one IEPR 23 goal, that would be ideal, and to do those one, or two, or 24 three year centers as we recommended in our framework and 25 timeline, so that we can then put up all these key California Reporting, LLC

1 technology road maps to understand how everything is related 2 at any given point in time, over the next decade. I like what Angela does - short term, midterm, long term, 3 4 understand where are we towards meeting every single one of 5 those nine objectives. Our final report, including 6 recommendations for research development demonstration, and 7 also some thoughts on integrating the three perspectives, we 8 started back in June, so nine month study, something like 9 that, we're looking to wrap up some time in March, maybe a 10 month after that. But it's been an incredible project 11 because, as you can see from the list of project 12 participants, the amount of information, not only that is 13 available on the Web, but the amount of information that 14 vendors have provided us is, frankly, overwhelming. And to make some sense of that in terms of meeting what the 15 objectives of the study is, you know, where are we, where we 16 17 do we want to be, what is the vision for 2020 under this 18 group of people, and how do we get there and how do we give 19 the State, not only the Energy Commission, but the Utilities 20 Commission, a process, a method, a tool, where you can see 21 this is how we're meeting those objectives, and pull 22 together, you know, the IOU's, the MOU's and the vendor 23 community, that is exciting, but it is difficult, no doubt 24 about it. So, that's where we are. I'd be happy to answer 25 questions or meet with you afterwards, but that's the California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 snapshot for now.

2	COMMISSIONER WEISENMILLER: The only question I had
3	was on page 12, on the ACORE slide, where did demand
4	response come? You listed top three, but where was that?
5	Was that number four, or was it lower, or what?
6	MR. TRALLI: On the ACORE questionnaire?
7	COMMISSIONER WEISENMILLER: Yes.
8	MR. TRALLI: I don't -
9	COMMISSIONER WEISENMILLER: "Important
10	Technologies."
11	MR. TRALLI: Oh, on the Key Technologies?
12	COMMISSIONER WEISENMILLER: "Important
13	Technologies," it's your slide 12.
14	MR. TRALLI: Slide 12 is that one, right?
15	COMMISSIONER WEISENMILLER: Yeah, so where -
16	MR. TRALLI: Oh, okay, yeah, right, we had like, I
17	don't know, a dozen and a half or two dozen questions that
18	we forwarded to ACORE and ACORE forwarded that to their
19	membership, this synopsis, this just happens to be question
20	6, this was - we received this from ACORE. I would have to
21	go back and see what the attendant questions were that
22	touched on demand response, that's not under here.
23	COMMISSIONER WEISENMILLER: Okay, thanks.
24	MR. TRALLI: It's not to say that it's not, we'd
25	have to go look.

California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417 COMMISSIONER WEISENMILLER: Okay, thank you.

1

2 MR. GRAVELY: Questions from the audience? Anybody 3 online, if you want, would you raise your hand real quick before we go to the next speaker? Anybody interested --4 5 we'll have a question and answer session after the next 6 presentation also, so there will be an opportunity. Now 7 we'll hear from the public utilities perspective. Again, as 8 I mentioned, RW Beck and Steve Rupp will be presenting that, 9 and his will be presenting basically the successful proposal 10 they submitted to the Commission, it was a competitive 11 award, as were all three of these, and what their plans are and some other challenges going forward, and anything he's 12 13 learned today, he wants to inquire about. Steve? 14 Well, good afternoon and we very much MR. RUPP: 15 appreciate the opportunity to be in the company of so darn 16 many smart people. I'm going to try to not cover ground 17 that's been covered before with the excellent work that our 18 friends in the investor-owned utility space and friends in

19 the industrial space have covered, but I think, you know, 20 we've got the benefit of starting last, and I think that's a 21 really good position to be in, in this space. Tons and tons 22 of lessons learned, tons and more lessons to be learned in 23 the coming weeks, months and years about how we really 24 navigate our way through the Smart Grid future that we're 25 facing. We're really excited about the challenge that's California Reporting, LLC

1 before us and I think, to kind of summarize it quickly, you 2 know, we've got 29 and growing, different voices that 3 reflect California's interest in energy and how Smart Grid might change our energy future, and that's in our community-4 5 based utilities. This is a very interesting population of 6 decision-makers and service providers to work with, they're 7 extraordinarily diverse. We've got folks that are small 8 electric only service providers serving maybe a few thousand 9 customers in a very rural setting, to whom demand response 10 really isn't a relevant topic to discuss, to whom changing 11 the way that they go out and read meters is really not very exciting because they see that process of interacting with 12 13 their customers as being vital to the service that they 14 provide in their community. So, that's one end of the spectrum. At another point in this place, we have utilities 15 16 that are providing telecommunications, natural gas, 17 electricity, and water to their community, and to them this 18 whole question about Smart Grid looks very different than it 19 does to our traditional electric utilities. We've got 20 leaders and followers, we've got folks like SMUD and 21 Glendale, Santa Clara, that are really advancing the 22 technology of Smart Grid. We've got folks that haven't even 23 started thinking about it. And in the middle is where most 24 of our states' publicly owned utilities, they're in a pack 25 watching and waiting carefully to understand which direction California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 the tide is going to flow, so they can make a decision that 2 is going to provide the greatest benefit and the least 3 impact to their communities.

So we've got now a challenge before us, which is to 4 5 bring 29 different voices to the table and try to coalesce 6 their interests into a road map that helps get to the vision that I don't think any of them disagree with in terms of the 7 8 importance of achieving these policy objectives that we've 9 set out in IEPR, like trying to make a decision to travel 10 from the far northern part of the state to the far southern 11 part of the state, there's a lot of ways to do it, you can 12 take an airplane and get there quickly, or you can take back 13 roads on your bicycle and spend a couple years doing it. 14 And that's, I think, really what's going to test the 15 robustness of any road map that we come up with out of this process is, is there a path that works for everybody that is 16 17 at the table. And to the extent that we can help Mike and 18 his people on the research side understand where to apply 19 their energy and their efforts in making sure that the paths 20 are free of roadblocks and that they're able to advance the 21 ability of these paths to provide an efficient course for 22 folks to navigate their way through the Smart Grid, then we 23 will have done our job. So that's kind of how we see trying 24 to bring together the POU perspective.

25 Again, covering a lot of ground that's been covered California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 before in terms of what the vision is, I'm not going to go 2 into that because we've articulated it really clearly. We 3 see the project as having three really important real goals, 4 1) to try to develop a broadly shared and supported vision 5 of the Smart Grid for 2020, one that not only encompasses 6 the distinct difference between investor-owned utilities and 7 community-owned utilities, and one that addresses the 8 interests of not just the service providers, but also the 9 technology providers, as well as one that reflects 29 10 different types of utilities in the state. It's going to be 11 a real challenge, we've got some strategies around how to do 12 it; 2) coming up with what really is the core of the road 13 map, and that is a technology and a program assessment 14 framework that allows utilities large and small to try to find a path that's going to work best for them and their 15 16 owner ratepayers, if we can accomplish that, then I think 17 we've really done the best service that we can do, and we'll 18 go into the presentation here and tell you a little bit 19 about how we're going to do that; finally, building with the 20 other efforts in the research project, we've got to come up 21 with a real coalesced, comprehensive road map that's going 22 to work for everybody, so hopefully we can accomplish those 23 three important goals.

24 We talked about this ad nauseum, about how the 25 state's energy landscape is changing, what's really California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 important, so I'm not going to belabor that. I think what's 2 important, though, to touch on is, particularly around 3 issues like greenhouse gas reduction, the community-owned utilities is a great example of local government at work, 4 5 you've got utility boards and city councils who see it upon 6 themselves to set policies and make determinations about the direction of their community that's not only aligned with 7 8 what the broader state and nation want to do, but really 9 reflect the individual desires, interests, at once of the 10 folks that are in the community. And with that, you see 11 when you look at the state's publicly owned utilities, 12 you've got some folks that are more aggressive than what the 13 state vision is, and you've got folks who are much less 14 aggressive than what the state vision is, in terms of things 15 like greenhouse gas reduction. You've got utilities who are 16 committed to rolling back their reductions to a greater 17 degree, and sooner than what AB 32 would have, and you have 18 utilities that are scratching their head, wondering how 19 they're ever going to accomplish that when they're dependent 20 upon carbon-based fuels to provide cheap power to their So it's going to be a very interesting task to 21 customers. 22 navigate.

23 We talked about this, we've got to come up with a 24 common POU vision, which doesn't mean we have to have 25 everybody in agreement about what we're going to do, we just 26 California Reporting, LLC 27 S2 Longwood Drive, San Rafael, California 94901 (415) 457-4417 1 need to be able to get through a highly collaborative 2 process, 29 different voices to the table, that can 3 contribute to the state's plans to go and rely on Smart Grid to achieve important energy efficiency improvements, 4 5 important integration of distributed renewable resources, 6 and these things that, in my opinion, are realities that 7 utilities have to embrace, they just need to find a way to 8 do it that allows them to meet their commitments to their 9 customer ratepayers.

10 Our process, you know, we've got to engage the 11 State's publicly owned utilities, we've got to get them to 12 collaborate, we've got planned a series of stakeholder 13 processes that both the IOUs and JPL and their team had to 14 go through, and I hope to learn a lot about how to do that well by working with them, and then, again, come up with a 15 16 road map that is going to return value back to the utilities 17 that are depending on us to help provide that kind of 18 direction.

19 We've laid out a very detailed project approach, 20 working with the staff here at the Energy Commission, and 21 the publicly owned utilities who will be involved in it, 22 it's flexible, it's adaptable, it's not yet set in stone, 23 but generally it's built on this idea of a stakeholder group 24 that is our vehicle for collaboration, focusing on 25 developing a framework around evaluating the technologies California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 that we've define as Smart Grid, and understanding how to 2 measure and predict the impact of those technologies on 3 achieving important goals, and understanding at what risk 4 and at what cost, so that that can be formulated into the 5 decision, and in the end coming up with a road map that 6 leads to the vision that has a path on it for all of the 7 different utilities.

8 Our schedule, we're just getting started, we expect 9 to be wrapped up by mid-summer. We'll be last to start, 10 last to finish, and look forward to doing as good a job as 11 our friends at JPL, PG&E, Edison and San Diego have done. 12 So, I'm beginning, so we don't have a lot of pithy content 13 for you yet, but I'm happy to answer any questions about our 14 approach that I can.

15 COMMISSIONER WEISENMILLER: Yeah, thank you, just a 16 couple of questions, one is, in terms of the POUs at this 17 point, are there any utilities, say, a SMUD, or an LADWP, 18 which have put together already a road map for their Smart 19 Grid efforts?

20 MR. RUPP: There's a broad spectrum of road maps 21 that are out there. You'll find road maps that Glendale has 22 completed, a fairly comprehensive road map, Burbank is not 23 quite as far along, but further than most, SMUD, of course, 24 is way down the road, they have a very clear vision, and it 25 was very well articulated in the Smart Sacramento project, 26 California Reporting, LLC

the State's largest Smart Grid implementation grant through the ARRA Stimulus program, so you've got, again, a great example of folks that have very highly evolved thinking about Smart Grid in terms of both their objectives and the timelines and the costs and the expected benefits of getting there. You know, we've got a lot of utilities. In fact, I would say most of the State's POUs haven't started yet.

8 COMMISSIONER WEISENMILLER: And one of the 9 challenges, I think, for you, is the basic question of how 10 much of these components, hardware or software, really have 11 economies of scale which could certainly affect what is 12 optimal for your Grid vs. your LADWP, say.

13 MR. RUPP: That's a great point, and it's a problem that really is not particularly unique to California's 14 publicly owned utilities, you know, you could look across 15 16 the country at how this challenge plagues utilities who want 17 to make moves in the directions that you've seen the larger 18 ones doing -- Austin Energy, SMUD -- but they can't afford 19 to do it, they can't afford to take the risk around 20 technology obsolescence, the economies of scale aren't 21 there, and it does become a challenge. So, some examples of 22 - I can tell you about that utilities are taking to overcome 23 those challenges, as our publicly owned utilities have done 24 for many years, when they get into the economies of scale 25 challenge, they begin to combine forces. And so, a joint California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

action becomes a vehicle through which publicly owned
 utilities can accomplish these broader objectives with least
 impact on their community ratepayers, or their owner
 ratepayers.

5 COMMISSIONER WEISENMILLER: Yeah, I guess the final 6 one, certainly along with the economies of scale question, 7 typically you have a much lower cost of capital, so in 8 theory, at least, for more capital intensive technologies 9 might be more attractive for you as opposed to the IOUs.

10 MR. RUPP: That, taken on its own face, is 11 absolutely true, the cost of capital tends to be more 12 attractive for publicly owned utilities, but you have to 13 look at capital expenditures in the context of a broader 14 equation that relates to what you're willing to charge customers for your product, and many publicly owned 15 16 utilities put the cost of energy as number one by a large 17 gap over any other requirement that's important, and so then 18 it becomes not just the cost of capital that's important, 19 but spending any capital, and understanding, really, what is 20 the return of that investment to their ratepayers. So, it is, you know, certainly cheaper for a publicly owned utility 21 22 to go out and borrow money from time to time and that's not 23 entirely true for every publicly owned utility, but, taken 24 by itself, it's not really an indicator that it's an

25 advantage for them in this context.

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

COMMISSIONER WEISENMILLER: Thanks.

1

2 MR. GRAVELY: Questions from the audience here? 3 MR. TRALLI: This is a question looking nine months from now when we start integrating your study into ours. 4 Ι 5 think I read that the MOUs or POUs, they're subject to 6 different rules or whatever for power generation. You guys 7 can own your own power generation assets, whereas the IOUs 8 cannot since the deregulation - or what's the difference on 9 the power generation side between the POUs and IOUs, and 10 where you see some, in an overall statewide Smart Grid, 11 where do you see the overlap on that side alone, the gen 12 side with the IOUs and the technology community? 13 MR. RUPP: Well, so it's interesting, and you can look at it from a couple of different directions, and I 14 don't know that there is one answer, and I know for sure 15 there is no short answer to it. If we look at it from 16 17 what's relevant to this dialogue, which is distributed 18 generation, there really is no difference. A municipal or 19 publicly owned utility can go out and own a small utility 20 scale or a rooftop scale distributed generation resource, 21 just like an investor-owned utility could - zero difference. 22 You know, the differences around owning assets, I think, 23 changes as you begin to start talking about larger and

24 larger and larger assets, and how that fits into the

25 regulations in the State of California. But I think it's

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 also true that, you know, I'm sure I'll find out if I'm 2 wrong here, but I do believe that all of our State's 3 investor-owned utilities still own generation, maybe not as 4 much as they used to, but they all still owned, and they're 5 all still building and developing new generation assets. 6 So, again, I don't see it as a huge discriminator in this 7 context.

8 COMMISSIONER WEISENMILLER: Yeah, and I don't think 9 we need to spend much time here on that issue, that type of 10 background is certainly in the IEPR if you read it.

11 MR. TRALLI: Oh, David Tralli, JPL, question. 12 MR. RUPP: So, my strategy of trying to say the 13 least to get the least questions did not work. Next time. I've got 100 percent more questions than anybody else. 14 15

MR. GRAVELY: Go ahead.

16 MR. RUSS: Yes, hi, Steve. My name is Bob Russ with 17 Internex. We, too, have assisted some MUNIs and stuff in 18 helping them sort of lay things out, and what's interesting 19 is that you do have the leaders, I mean, you have some folks 20 like Alameda Power which is 80 percent renewable already, 21 you know, way ahead of any goal California has, Silicon 22 Valley Power way ahead in those areas, too, in implementing 23 Smart Grid stuff. But what we find, and what I'm just 24 curious if you've had a chance to start structuring your 25 thinking on this, is because in a way the MUNIs, their California Reporting, LLC

1 owners, are their Board, you know, they're all one and the 2 same, and so they have a lot more flexibility in justifying 3 expenditures. Have you thought at all about how do you help a MUNI really sort of economically justify what it means to 4 5 try to implement Smart Grid within their system? Thank you. 6 MR. RUPP: Well, there's - if you want to talk about 7 objective economic justification, these are formulas, and 8 economic justification is a test that, you know, is very 9 straightforward. Where it becomes difficult in this space 10 is understanding the benefits side of the equation because, 11 you know, I would content that benefits are still evolving from Smart Grid implementation. We're still trying to test 12 13 and understand how we quantify the benefits associated with 14 distributed generation. We're trying to understand how to 15 quantify the benefits associated with demand response. And you know, so it's a little bit of a - I won't call it a 16 17 guessing game, but it's not a simple analysis that one might 18 do in terms of looking at prioritizing your capital 19 expenditure plan for the year, which is a very mechanical, 20 methodical approach. So, the math is what the math is. Ι 21 think what you find differently is that a small municipal 22 owned utility is not very well positioned to manage a very 23 significant amount of risk around what a benefit might be. 24 Certainly, the larger more sophisticated municipal 25 utilities, SMUD, for example, a leader in research around California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 demand response, is very well-positioned to take a little 2 higher risk about quantifying the benefits associated with 3 the demand response because they've been doing research on it for 20 years, so they know very well, and what they make 4 5 a decision about just to spend a dollar to achieve a \$1.20 6 of benefits on demand response, they feel confident about 7 doing that. I can tell you, other utilities have not done 8 that research and don't understand or see the same benefit 9 from demand response, take the City of Lompoc, a coastal 10 community that doesn't have a needle peak to deal with, 11 demand response to them? Not so easy to quantify.

12 MR. RUSS: Yeah, I mean, just as a follow-up, like 13 you say, the big guys, the SMUDs and the LADWPs and the 14 IOUs, of course, they can spend lots of money on business cases and very detailed financial analyses, and I don't know 15 16 the details of your engagement, are you going to try, as 17 part of the assessment process, to try to generate a 18 database or some kind of a master spreadsheet that helps 19 these MUNIs actually evaluate what are the pros and cons for 20 their particular circumstances?

21 MR. RUPP: We certainly intend - and it's in the 22 middle phase of our project, to - and it's really not -23 there's not a lot of new science here - what we're talking 24 about doing is taking some of the work that's been done at 25 DOE, some of the work that I know you folks have been California Reporting, LLC

1 involved in, and we've been involved in developing business 2 cases for, you know, utilities of all shapes and sizes, and coming up with a platform, if you will, through which some 3 decisions can be tested to understand what are the 4 5 implications. I have to be very careful because there's not 6 enough time or money for us to go through and develop 7 business cases for 29 different utilities, but what we can 8 do is kind of come up with some rules of the game, if you 9 will, that reflect what the industry is doing in terms of 10 managing the risks associated with quantifying benefits that 11 are indeterminate at this point, so that they can hopefully increase their confidence in understanding what to do with 12 13 the outcome of that analysis. Certainly, it is a part of 14 what we're doing.

MR. GRAVELY: Okay, any other questions? Thank you.
MR. RUPP: Thank you very much.

17 MR. GRAVELY: Our last speaker of the day here comes 18 from our friends in the Bay Area, and the PUC will talk 19 about the SB 17 and, of course, in the area of two major 20 objectives and policies, SB 17 is one, and AB 2514 on the 21 storage side are two that we've talked about in the last 22 workshop and this one. So I think, actually, Chris is 23 involved in both of those. You can answer questions if you 24 want.

25

MR. VILLAREAL: Good afternoon. I'm Chris Villareal California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 with the California Public Utilities Commission. Thanks to 2 Mr. Rupp's presentation, I now have 45 minutes and, as a 3 regulator, I intend to use all 45 minutes now to go over my presentation, this is just the outline of what I anticipate 4 5 to talk about. I anticipate going through the first half of 6 my presentation relatively quickly because, on the PUC side 7 of the proceeding, we pretty much haven't done any - we 8 haven't issued any decisions since June of this year. And I 9 plan to talk more about what we plan to do in the next year. 10 So this is just a short history of our rulemaking, we 11 started it in December 2008, in response to the Energy 12 Independence Security Act passed by Congress in 2007. SB 13 17, which was sponsored by Senator Alex Padilla was signed 14 in October 2009, and then that gave us time to issue - to 15 address the discussion in SB 17. So, in response to ISO, we 16 issued a decision in December - all these years are running together now - 2009 - so, ISO directed all State Commissions 17 18 to consider five new standards to PURPA. In the course of 19 our proceeding, we declined to adopt any of the standards 20 since we had adopted most of the suggestions in our AMI 21 roll-out. Instead, we went a little bit further than what 22 ISO had directed States to do, and we set three policy 23 The first one is that all customers be provided qoals. 24 retail and wholesale electricity prices in a uniform manner 25 by 2010, that customers be allowed to access data with an California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 authorized third party by the end of 2010, and that 2 customers be provided near or real time access to their 3 usage information, those customers of AMI, by the end of So, while we were doing that, SB 17 was passed, and 4 2011. 5 I'm not going to go through this, this is what characterizes 6 a Smart Grid according to SB 17; what I will note is that 7 the words "cost-effective" are listed six times. So, the 8 Legislature is very direct in what we are supposed to 9 address on Smart Grid. So, SB 17 directed us to set the 10 requirements for the Smart Grid deployment plan to be filed 11 by the utilities, the investor-owned utilities. In our 12 proceeding, we ended up requiring eight topics, and they're 13 listed here, and I'm only going to talk about a couple of 14 these. We directed the utilities to have cost and benefit 15 estimates in their Deployment Plan. Now, for the costs, we 16 gave them two timelines. We directed the utilities to file 17 a five-year provisional cost estimate and a 10-year 18 conceptual cost estimate, understanding that, looking at the 19 future six years ahead, we can't accurate predict what the 20 costs are going to be because we don't know what the technologies are going to look like, or the costs of 21 22 technologies. Similarly with benefits, we understood that 23 the benefits are going to be not necessarily problematic, 24 but very difficult to quantify. On the benefits, we also 25 allowed the utilities to justify - or not justify - to California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 describe unquantifiable benefits around reliability and 2 environmental benefits. The other thing we also added was a requirement that the deployment plan address grid and cyber 3 security. The PUC is taking security very seriously and 4 wants to ensure that whatever is rolled out on Smart Grid is 5 6 secure, and by having it be part of the initial roll-out, 7 that in our mind helps ensure that security is built into 8 the product instead of being added at a later time. So, the 9 utility deployment plans are to be filed no later than July 10 1, 2011. We also anticipate having a joint workshop with 11 the CEC and the ISO in March or April where the utilities 12 will present their draft deployment plan, and that will be a 13 public workshop, so all parties and all members of the public are invited to attend. 14

So, this is, I guess you could say, the PUC's vision 15 of the Smart Grid. This morning, you heard the utilities 16 provide their vision and, after we came back from lunch, 17 18 Mike Gravely pointed out that there was one thing that he 19 thought was missing, and that was a market. I was going to 20 say the same thing, is that the vision presented by the 21 utilities were missing the market aspect of it, and so, from 22 the PUC's perspective, we see a Smart Grid encompassing 23 three main areas, Smart utility, where their infrastructure 24 gets more upgraded and becomes smarter, the Smart customer, 25 who is enabled and is provided with information to take California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

control of their usage, and the market - so, the market is
 where a lot of the innovation will take place. The market
 can be applied to either the utility or the customer, but in
 both instances, it has to be rolled into the Smart Grid.

5 So, this is just the short slide showing what are 6 the policy goals of the PUC's view of the Smart Grid. 7 Again, I don't think I really need to go over this, this is 8 following our June decision.

9 So, where are we going to go now? There are 10 actually five Next Steps that we anticipate taking on over 11 the next 12 months or so. So, Metrics. Metrics is one of 12 the things that is required to be in the utilities' baseline 13 come July 1. In our June decision, the PUC determined that 14 there was not enough of a record to come up with sufficient metrics that would be helpful and informative to the PUC and 15 16 the parties, so we created a separate phase of our 17 proceeding to do that. PUC staff issued several proposals 18 over the course of a couple months, and we ended up holding 19 workshops and informal webinars to discuss further the 20 attempt to come up with consensus metrics. Over the course 21 of that phase, the utilities, working with staff and other 22 third parties, came up with a list of consensus and non-23 consensus metrics. The consensus metrics cover areas 24 including customer AMI issues, plug-in electric vehicles, 25 electricity storage and grid operations. What needs to be California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 further discussed are other areas that we are interested in 2 around customer AMI grid operations, as well as further discussions on how to quantify environmental benefits that 3 can be attributed to Smart Grid, and how to come up with 4 5 robust cyber security metrics. On cyber security, there was 6 a lot of concern about creating metrics before there are any 7 policies created. And so, we are going to engage with 8 utilities and with interested third parties on an informal 9 basis how to develop good and robust and useful cyber 10 security metrics. I imagine that there will be a similar 11 effort related to environmental discussion, as well. And we 12 expect to issue a proposed decision adopting interim 13 consensus metrics the first quarter of next year.

14 The next major issue is customer access to 15 information. So, as stated previously, one of the goals of the Commission is to allow customers to choose who they want 16 17 to share their information with. So, then, we decided that 18 we needed more information, so we set up another phase, an 19 ongoing phase, actually, of our current proceeding to 20 address customer access issues. One of the questions to be 21 addressed is what is the PUC's jurisdiction over third 22 parties such as Google? The next slide will get into a 23 little more detail about that topic. So, as we worked 24 through our process on customer access to information, we 25 got a number of third parties who are all privacy advocates California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 and I'll admit that privacy was not something we anticipated 2 having to deal with in this phase, and as such, as part of the customer access phase, we added a discussion about 3 privacy. While we were in the midst of doing our phase, the 4 5 Governor signed SB 1476. SB 1476 puts requirements on the 6 utilities on how they are to protect customer information. 7 So, we held a series of workshops, one of the privacy 8 advocates, the Center for Democracy in Technology, proposed 9 a framework where the utility would not need to get customer 10 approval if the purpose was something secondary to the 11 primary purpose of the usage requirement, so, energy 12 efficiency, for example. Energy efficiency - if a third 13 party is contracting with a utility and the primary 14 responsibility of that contract is through energy efficiency, that third party facility would not need to get 15 16 customer approval to share that information. If that third 17 party contractor wanted to do something other than energy 18 efficiency, they would then need to get customer approval to 19 use that data. So, in the process, there are three types of 20 third parties that are going to be covered under the privacy 21 rules, one will be the third party obtaining that of the 22 utility backhaul, and this would be the example of Google, 23 where the customer signs up with Google and authorizes 24 Google to access their usage through the utility. The 25 second type of access is where the third party is obtaining California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 data directly via the Home Area Network, so it was just the 2 Home Area Network was activated and sending a signal 3 directly to the house, and the customer buys a piece of technology, and is just reading the information off of the 4 5 meter. And the third third-party is the utility contractor 6 that most customers never see because it's just simply a contract between the third party and the utility, and 7 8 whatever comes out of that process is stamped with the 9 utility's name on it. Of course, there are jurisdictional 10 concerns over our responsibility and enforcement over third 11 parties, and we expect to issue a proposed decision on this 12 topic in the first quarter of next year. On the topic of 13 cyber security, we've differentiated between the different 14 types of cyber security, there is cyber security of customer data and the overall grid cyber security. The security 15 16 customer data is going to be rolled into the customer access 17 and privacy phase through national standards. On the cyber 18 security, we anticipate building off of the standards, the 19 quidelines issued by the NIST early this year, and we 20 anticipate starting a new phase, another phase of our Smart 21 Grid proceeding to address cyber security rules, policies, 22 protocols, whatever word is most appropriate for that, in 23 the first or second quarter of next year. While we are 24 doing that, the PUC staff anticipates working with the 25 utilities and interested third parties to become more up to California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 speed on what is going on in cyber security. The reason for 2 that is, the PUC generally has not been involved in cyber security. Most cyber security is done on the transmission 3 level through NERC, and with little information and 4 technology being done on the distribution side, there has 5 6 been little need to do cyber security rules on the state side. As Smart Grid rolls out, as more technology is 7 8 installed on the distribution side, and more technology is 9 installed in the customers' homes, that increases the risks 10 of cyber attacks. As states have jurisdiction over the 11 distribution grid, we anticipate creating and building rules 12 around that area.

13 And finally, we anticipate dealing with the issue around the Home Area Networks. So, when the PUC approved 14 the utilities' AMI investments, they all included the Home 15 Area Network. The Home Area Networks was one of the main 16 17 drivers of the cost benefit analysis where the customer 18 would use the Home Area Network to do various demand 19 response and price response of taking advantage of prices. 20 The AMI that are rolled out by the utilities that have the 21 HAN on there, but it is not activated. The HAN is loaded 22 with ZigBee Smart Engine Profile 1.0 and the utilities, as 23 we've been told, are waiting for an upgrade to 1.0 to be 24 finalized before they will make an effort to turn on the 25 Home Area Network, thus made a date for 2.0 completion even California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 though, as stated earlier, it was some time in 2011, that is 2 just for the standard, and that does not take into account the utilities system testing, and it does not take into 3 account the utilities testing of third party products. 4 As such, we don't anticipate the activation of the HAN until 5 6 2013 or 2014, at the earliest. So, in our proceeding we've 7 had third party vendors asking the PUC to have a phase to 8 address activating the HAN with the existing 1.0. I'll note 9 that the State of Texas, who is also facing a similar 10 problem, is in the process of activating all of the HANs 11 rolled out in the State of Texas with an updated version of 12 1.0 that they call 1.X. And 1.X addresses many of the 13 initial concerns about 1.0, around cyber security, and the 14 privacy questions that have been raised on 1.0, as pointed out in the last bullet. In addition to security and 15 16 privacy, there are some stranded cost concerns about 17 customers potentially buying products that are not backwards 18 compatible, in other words, they buy something compatible 19 with 1.0, but it's not compatible to 2.0, and along with 20 that is the interoperability and upgrading devices. My 21 personal opinion is that, if we're looking at a two-year 22 process, and if California and Texas both end up activating 23 their 1.0/1.X, someone will figure out how to deal with the 24 backward compatibility question. That's my personal 25 opinion, no one else's. And that's all I have, and I look California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 forward to any questions that anyone may have.

2 COMMISSIONER WEISENMILLER: Thanks for your 3 participation today, it's really helped. I was sorry that 4 Commissioner Ryan wasn't able to be here, but I think you've 5 done a good job representing your agency.

6

MR. VILLAREAL: Thank you.

MR. GRAVELY: Questions related to Smart Grid? 7 8 MR. VILLAREAL: Well, before I leave, since I have 9 the mic, I'll point out that yesterday the PUC approved a 10 new OIR relating to storage, AB 2514 directs the PUC within 11 some amount of time to set policies around incentivizing 12 storage for the market and we are about a year and a half 13 ahead of the deadline, so we went ahead and opened up an 14 I believe the deadline for comments on the OIR is OIR. 15 January 21st, they're mainly supposed to be focused around a 16 white paper issued by the division that I work in, Policy 17 and Planning Division, so if anyone has any questions on 18 storage, I'll also be more than happy to try to answer them.

19 COMMISSIONER WEISENMILLER: That's very good. I
20 think Mike can make a similar announcement about responding
21 to that legislation.

MR. GRAVELY: Oh, I'll be glad to. So we have an item on the Business Meeting next week for approval for some research under U.C. where we are developing a vision for storage in parallel with these for 2020 with the ultimate California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 goal of providing insight and information to your 2 rulemaking, looking at where storage could play with the 3 primary focus of the objective of 2514, but also looking at mixtures of storage and values of storage and things like 4 5 that, so we are working actively with the PUC and the 6 industry to try - and you've heard through all three presentations the importance of storage to California and 7 8 the importance of storage and the challenges that storage 9 faces, so we've stepped up there now. I think one side 10 point, also, besides Texas, we are also doing some research 11 on the customer acceptance of Home Area Network displays 12 through UC Berkeley, and Ron Hoffman is here if you have 13 questions about that, but we are doing some evaluations and 14 Chris is actively involved in that, too, but again, it's 15 strictly a research effort to look at the capabilities of 16 SEP 1.0 and the capabilities of existing systems to use that 17 and we're doing a small scale demonstration with several of 18 the utilities in California to help answer some of the 19 questions that are coming up about what is the capability of 20 the systems. So we do see quite a few of those. We will be 21 - some of you may have attended our November 16th workshop on 22 Storage. One of the commitments we made out of that 23 workshop prior workshop in the March-June timeframe was to develop a white paper with kind of an assessment of the 24 25 state of technology, of storage technology to support California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 renewable integration and we will be providing that as part 2 of a discussion topic for the next IEPR workshop on storage policy from there. So, questions for the PUC or for Chris? 3 COMMISSIONER WEISENMILLER: Yeah, I was just going 4 5 to make the obvious comment, too, that obviously both 6 agencies are moving in response to the Governor-Elect's 7 priorities for Storage, along with the legislation. 8 MR. GRAVELY: Well, as I anticipated, we are now at 9 a point for public comments, so we will give the opportunity 10 of the people in the room first to comment on any of the 11 discussions we have here today, and please come to the mic if you have comments or questions, identify yourself, and 12 13 then we'll move forward and if we have any of those, we will

14 go online. Any questions from anybody in the room here for 15 any of the participants or any of the speakers that are 16 here?

17 MR. JOHNSON: Good afternoon. This is Walt 18 Johnson, I guess I would say I'm representing UCSD with this 19 question. I was struck particularly by the fact that, in 20 the ISO's presentation and the presentations about the IOUs 21 and POUs, no mention whatever was made of microgrids, 22 whereas the JPL presentation from industry had some 23 significant comments regarding microgrids, and I'm curious 24 if that reflects the fact that the other entities, the 25 utility and operation entities, don't see microgrids as California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

anything unique relative to what they're doing, or how they
 - where in their road maps those things would fit, if they'd
 been overlooked or they are in some sense there, but I just
 didn't see it or hear it.

5 In general, I have to say that MR. GRAVELY: 6 certainly the IOUs are involved in microgrids because we 7 have both DOE and PIER funded projects right now to do field 8 demonstrations on microgrid. I would tell you, my personal 9 belief is the value of two different perspectives, I think 10 this is one of the examples where I think the commercial 11 perspective sees - it's probably easier and faster for 12 commercial growth through a microgrid than it is to do a 13 utility grid, and so, potentially the reason is, and I'll 14 let David answer that question better than me, but I think one of the reasons from our personal research is the fact 15 16 that there is a lot of interest and opportunity today in 17 microgrids for new technologies to be demonstrated at a 18 smaller scale and a much more cost-effective scale, so the 19 commercial market is far more attuned to microgrids than 20 they are at trying to convince PG&E to put something on 21 their whole grid. Maybe you want to address that, David? 22 MR. TRALLI: David Tralli, JPL. I think what you 23 just mentioned, Mike, was one of the key points, that the 24 microgrids afford the ability to go out there and 25 demonstrate things at some scale right now, of course, with California Reporting, LLC

1 eventual scale up targets. I know with the fuel cell stuff, 2 there is a demonstration project somewhere in Southern 3 California and the interest there is to now move up to a commercial scale 10 megawatt-type system, and so growing it 4 5 that way. There are some other advantages that came up that 6 we will have documented in the report, but that one, in terms of demonstrating early on what some of the 7 8 capabilities and issues are to resolve on key technologies 9 is one of the key ones, from a market development 10 perspective.

11 MR. GRAVELY: I will point out just for the 12 audience, in case you are unaware, that two of the largest 13 microgrids that we're involved with right now, of course, 14 are at University of California at San Diego is doing one on their campus, and the San Diego Gas & Electric has been 15 doing one for many years with the DOE funding and PIER 16 17 funding, so both of those are what I would say community 18 scale, or larger. So, there is quite a bit of work being 19 It may be the fact that the information is at a level done. 20 that's in the report, but not in the presentation also. 21 Other questions?

22 MS. CHUANG: We do have microgrids in our report, it 23 appeared on a list of objectives under the subcategory of 24 maintain and/or enhance the system reliability. We had the 25 provide for microgrid operation as objectively considered 26 California Reporting, LLC 27 S2 Longuaged Drive San Befeel California 94001 (415) 457 4417

for use of Smart Grid. There are also many projects mentioned and, in particular, the Appendix of the report, that the utilities are involved in. Perhaps these utilities want to talk about some of those projects, but it's true, we didn't have microgrids in the top or the high priority, but that was the result of the ranking exercise.

7 MR. STACK: Hello, this is J.D. Stack with the 8 California Smart Grid Center. And, Mike, I've got a 9 question for you. We've seen several different views today, 10 perspectives on Road Map to Smart Grid. I heard one of the 11 speakers, I think it was David, mentioned this is a suite of 12 road maps. Can you articulate your vision of how these are 13 going to be used going down the road? Is there going to be 14 an assimilation of these, or do you see them kind of in a 15 suite that people can work from?

16 MR. GRAVELY: The plan when we originally did this 17 was, from the research side, and our schedules were set so 18 that we could do this as part of the 2011 IEPR, and we still 19 hope to do that, is to put together the three of them 20 together and come up with the general consensus and us put 21 together the different data we get plus comments that come 22 from people outside the three contracts, and try to 23 integrate that into a state vision, and I would envision 24 that, if we are fortunate enough, to work it to be part of 25 and published in the IEPR for 2011 in the summer timeframe. California Reporting, LLC

1 If we're able to, there will be another Smart Grid workshop 2 in the March, April, May timeframe if we're able to get enough from all three vendors to do that. One of the 3 challenges that Pedro has in his office in Systems 4 5 Integration is to actually learn from all these different 6 efforts, but the original plan has always been to take these three diverse perspectives, see where the parallels are, and 7 8 see where the differences are, and try to come up with what 9 we consider is a single vision for the State that could then 10 go into the IEPR, and potentially into some of the other 11 State documents as we go forward.

12 MS. MANZ: I'm Laura Manz and I'm here on behalf of 13 Viridity Energy, who is the vendor doing the UCSD microgrid, 14 and I just wanted to pick up a thread here, that our V Power system works with the pallet and power flow so that we can 15 16 start bringing markets and economics together, so I don't 17 want to let that kind of fall by the table, it didn't come 18 up so much today, and I think it's probably ripe in the 19 future for further discussion, and we look forward to that 20 opportunity. So, thank you.

21 MR. GRAVELY: And we'll take that comment you have 22 before about it not coming up today, so I will encourage 23 everyone online and everyone here, the comment period ends 24 January 7th, please provide us your comments, your 25 recommendations of what you liked or didn't like, things 26 California Reporting, LLC 27 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 that were missed, technology - and this is a technology 2 assessment, so if you have things that weren't discussed and 3 you'd like our staff to be aware of, please feel free to 4 docket those. We would prefer you send everything to the docket, the information - it's on the message that we have 5 6 on the Internet and the message here gives you the address 7 of where to send it, but we would like that information 8 available, it allows us to incorporate that information in 9 our overall assessment. It gives us a Litmus test of 10 whether or not, as you hear all these presentations, if 11 we're on the mark or off mark. So, I would encourage people to take the time to provide that feedback officially through 12 13 the docket, so it becomes part of the 2011 IEPR drafting 14 process, and so we would encourage everyone to do that. 15 David, you had a comment?

16 MR. TRALLI: Dave Tralli, JPL, I had a comment on 17 the question before last, to clarify my comment on the suite 18 of road maps. I would think that the three different 19 studies, the road maps that they recommend, obviously, like 20 Angela mentioned, are the result of the discussions within 21 the perspectives of their team and the prioritizations that 22 came out of those teams. If we look to integrate all three 23 perspective road maps for the 2011 IEPR, we need to make 24 sure that we have something in common across which to bring 25 those three perspectives. And I'm just trying to iterate California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 what I mentioned in my talk, which was, if you have the 2 traceability to the IEPR requirements, and if we had that, 3 if we can do that, or represent the three perspectives in that manner, I think that would make the integration 4 5 somewhat easier to do because, otherwise, you know, you're 6 putting together three perspectives that are responding to 7 three different ways of prioritizing, three different sets 8 of objectives, and that's going to be extremely hard to pull 9 that stuff together. Now, on the suite, I think there is a 10 single maybe road map, or not, I mean, we're still 11 struggling with this, I still am, the road map that gets you to 2020. We're going to look at two or three architectural 12 13 options because that's the resources we have to do, but in 14 order to pick your preferred road map, we have to optimize 15 across something, and we have to optimize across the trade space, meeting the objectives, technical performance, cost 16 17 if we can get it, of functionality, ratepayer benefits, all 18 that. And so, we have to offer our view of what that 19 optimization was, and that optimization might be different 20 in the three different perspectives, which is another 21 complexity in integrating the road maps. So, I think that 22 is going to be really exciting, you know, there is a lot of 23 common threads between our study and EPRI's, and I'm sure 24 the POU ones will have common ones there, and then the 25 integration will be really a good thing to do.

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 MR. GRAVELY: I have to admit, this was a challenge 2 that was consciously created. We talked about this when we did the initial request, and we did not want to provide so 3 much detail as to steer the road map a certain direction, we 4 5 wanted the policy to be considered, we wanted creative 6 approaches, we wanted diverse solutions, we did not want to 7 - and I think the example I get here is, in fact, the IOUs 8 have provided information that is very consistent with what 9 they're doing and what they've talked about, I think, on the 10 commercial side, as I'd mentioned earlier, I think one of 11 the opportunities, the reason microgrids are mentioned so 12 much, is it provides more commercial demonstration 13 capability and more commercial growth, more commercial 14 transition capability, and I think, when we get to the POU 15 work, when they've got to marry the challenges of small 16 utilities, medium utilities, large utilities, multiple 17 utilities in one agency, and so I was afraid, consciously, 18 when we provided a Government direction, sometimes 19 Government directions can have a negative outcome, and we 20 did not want to stifle creativity, stifle solution, by 21 giving "this is the format you have to fit." So it makes 22 our job a little more challenging to integrate these, but 23 it's easier to have three defined products to integrate than 24 it is to tell three people where to go for a 10-year vision, 25 and not make a mistake. So, we - and Pedro gets to benefit California Reporting, LLC 52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 from that creativity. His office will be the one to help
2 integrate that, and we envision sharing that with the
3 public, but I do think, and just so you know, we consciously
4 anticipated three diverse approaches and it looks like we're
5 getting three diverse approaches, which I think is a good
6 sound. Anybody else with questions? Anybody on line have
7 questions? It appears nobody has questions online.

8 Okay, so I'll cover the next steps here with 9 everybody. This is a series of two workshops that we have 10 done, primarily the PIER program, one on Storage, one on 11 Smart Grid, we will take the information we have here and 12 come up with information that will be kind of a technology 13 baseline, that we will provide to the IEPR Committee, and 14 whether we end up doing a white paper here, or whether we 15 end up just integrating the road maps into a single road map 16 is yet to be determined, but we are planning on a workshop 17 in about five months, four to five months, that would talk 18 about how this technology rolls into the policy and if there 19 are policy questions and policy recommendations that we can 20 do that as part of the IEPR for 2011, we want to do that in 21 the future. So, I again would like to encourage people 22 online and people here to provide comments to the docket, 23 provide information to us, and if you have questions as to what you would like to see, but the ultimate goal for us is 24 25 to try and come up with information in the 2011 IEPR to help California Reporting, LLC

1 understand where Smart Grid is going and where it should go, 2 and if there are specific gaps that need to be addressed, if 3 there are specific policy issues that are creating 4 challenges, or if there are specific areas - I use the 5 analogy of storage - one of the areas that comes up, that 6 you hear a lot, is creating tariffs and creating incentives that will make storage meet the needs of the future. 7 In 8 Smart Grid, it may be more an area of how we work with the 9 PUC, how the public utilities plan their development and 10 paperwork for SB 17 in those areas, but we're trying to 11 integrate everything we've got and to the best knowledge we Our ultimate goal through this IEPR process is to 12 can. 13 share what we're learning and put that in terms of some 14 semblance of direction, but ultimately it'll be up to the IEPR Committee, who hears a lot more of this than I have a 15 chance to, to put this into a perspective of a report. 16 And 17 for those that aren't familiar, the IEPR will be drafted 18 over the summer, the draft comment is available in the fall, 19 it's published around the December timeframe, so we'll be 20 gathering data for the next six to seven months, and then 21 there is a public workshop when they provide all the 22 elements of that. But our office will be focusing on the 23 technology and the Smart Grid.

24 COMMISSIONER WEISENMILLER: I'd certainly like to
25 thank everyone today for their contributions. I think we've
California Reporting, LLC
52 Longwood Drive, San Rafael, California 94901 (415) 457-4417

1 had a very interesting session. We have three interesting 2 products, certainly those will be the basis for our 3 thinking, but, again, I think one has to be clear on a couple of things. The first is that we are working together 4 5 with the ISO and the PUC under the framework of the Clean 6 Tech Vision, which we're marching forward on, and so, as we 7 go forward, we will be jointly working through that, 8 certainly PUC will have much more formal proceedings, and 9 this is something for people to throw out ideas, much more 10 of a scoping session, but we certainly anticipate the 11 agencies to be working pretty much hand in glove on this. 12 And second is that we are certainly going to be very focused 13 in this IEPR on implementing the vision of the new Governor 14 and his direction, as we will really have a plan in place by July, dealing with renewable issues for both DG and utility 15 scale. And so there's going to be a lot of focus on the DG 16 17 component, and it's going to be a pretty serious - I was 18 going to say almost a forced march - between now and that 19 time. And certainly this will be a part of it, but again, 20 ultimately we're the deciders and so, again, thanks for your 21 contributions and we will certainly take your input, but it 22 is certainly the consultants are not going to drive the 23 process is the bottom line. Thanks again. 24 MR. GRAVELY: Thank you all very much.

25 [Adjourned at 2:42 P.M.]

California Reporting, LLC

52 Longwood Drive, San Rafael, California 94901 (415) 457-4417
