Subject: Central control of energy distribution

Sirs,

I read in this mornings San Francisco Chronicle that the all wise and knowing state government is considering determining just how much energy the citizens of California really need to be using. Also on the front page was the story of how the state is over 14 Billion dollars in debt.

It seems to me that now would be the time for a preemptive strike which could save the state some money. When you arrive at my residence to put the radio control unit on my home for electricity, why not put one on the gas line at the same time because I assume you will be taking over the rationing of natural gas before too long. Next, put a radio controlled valve on the water line which could shut down the amount of water we could use when the grand poobahs in Sacramento decide we don't need water in our swimming pools or to wash our vehicles. Think of the money that could be saved if you would install all of these devices in one trip!

Didn't the Communist party of the USSR have five year plans at one time which would allow the central government to eventually turn the country into a paradise? Haven't heard much about that lately. Maybe there is a lesson to be learned here.

I say " Don't do it".
