I don't know much about PCT. I do know recently we have bought two named brand programmable thermostats for our older central heat/air unit. Neither unit records the temperature accurately when checked against other mercury style or electronic gauges. In the winter when my thermostat reaches 75 degrees it is actual 68 degrees. I will recheck the readings for the air conditioner this summer, but the actual reading as I recall is much hotter then where the thermostat is set.

I find the idea of the government controlling my indoor climate offensive for one thing, but on a more practical matter, can you guarantee the accuracy of the temperature readings of the PCT?
