Computational Environmental Sciences Laboratory  
University of California, Irvine**

**August 10, 2009**

# Outline

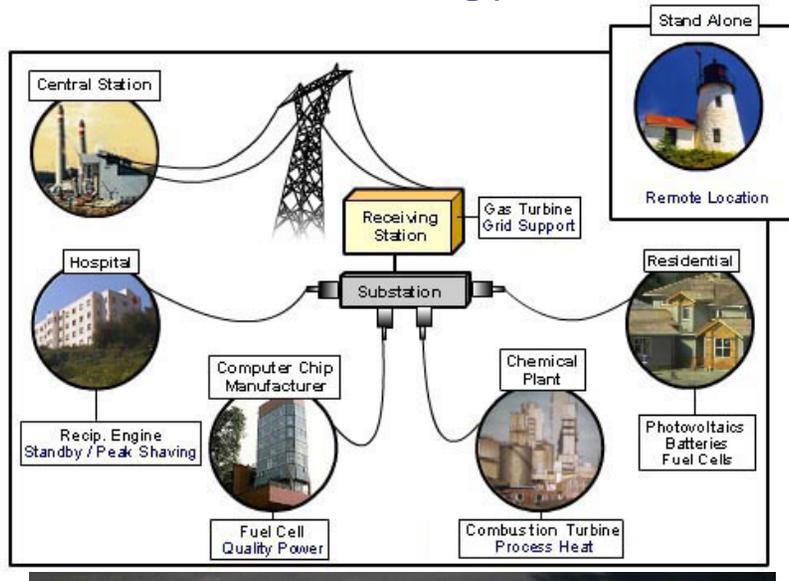

- **Overview of Methodology and Tools**
- **Regional Air Quality Impacts of Advanced Generation Technologies**
- **Summary**

# Overview of the Methodology

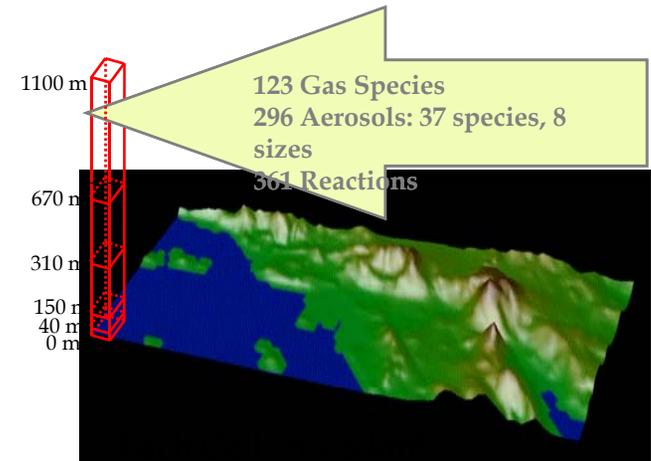

Determine impacts of Future Energy Technologies on air quality

## Future Technology Assessment

Introduce new spatially & temporally resolved emissions

## 3-D Air Quality Model

## Air Quality (AQ) Impacts

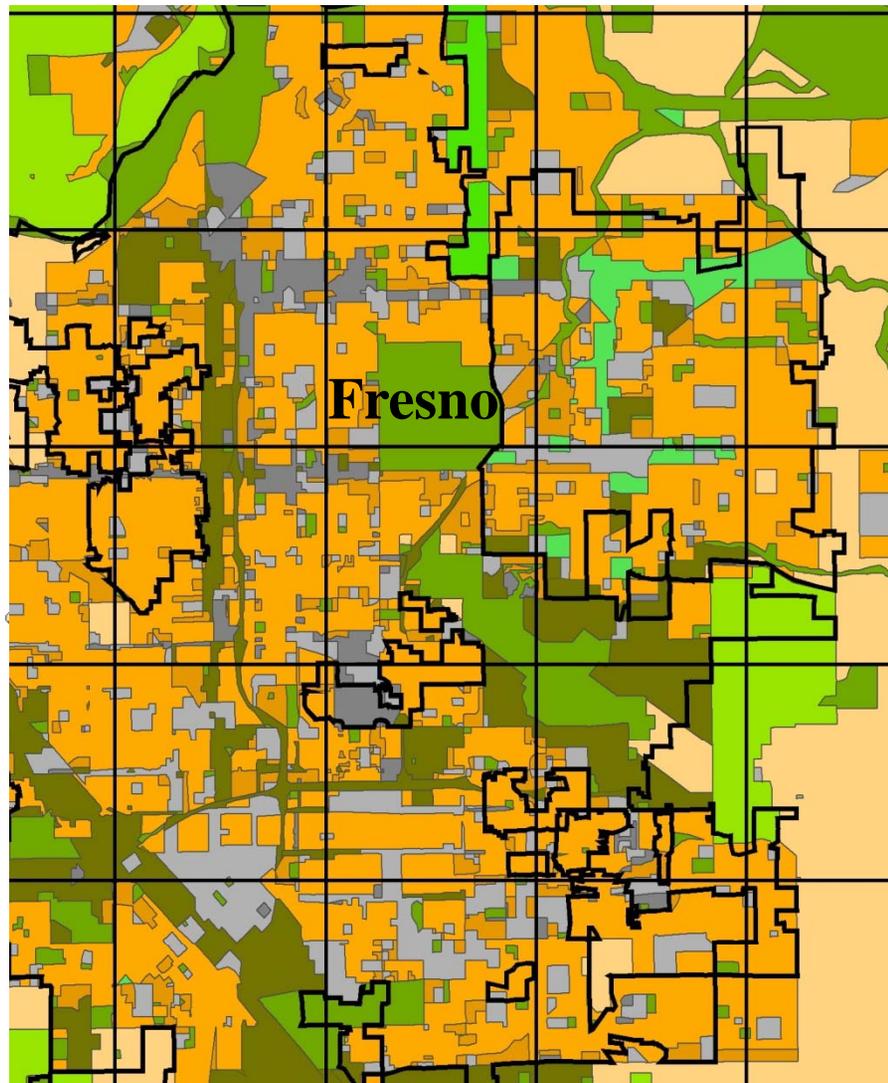

Feedback to Scientific Community, Regulatory Bodies, General Public, etc.

Determine spatial & temporal AQ impacts

# How do we spatially allocate future technology?

## GIS Land-Use Data (e.g., Long Beach & Fresno Areas)

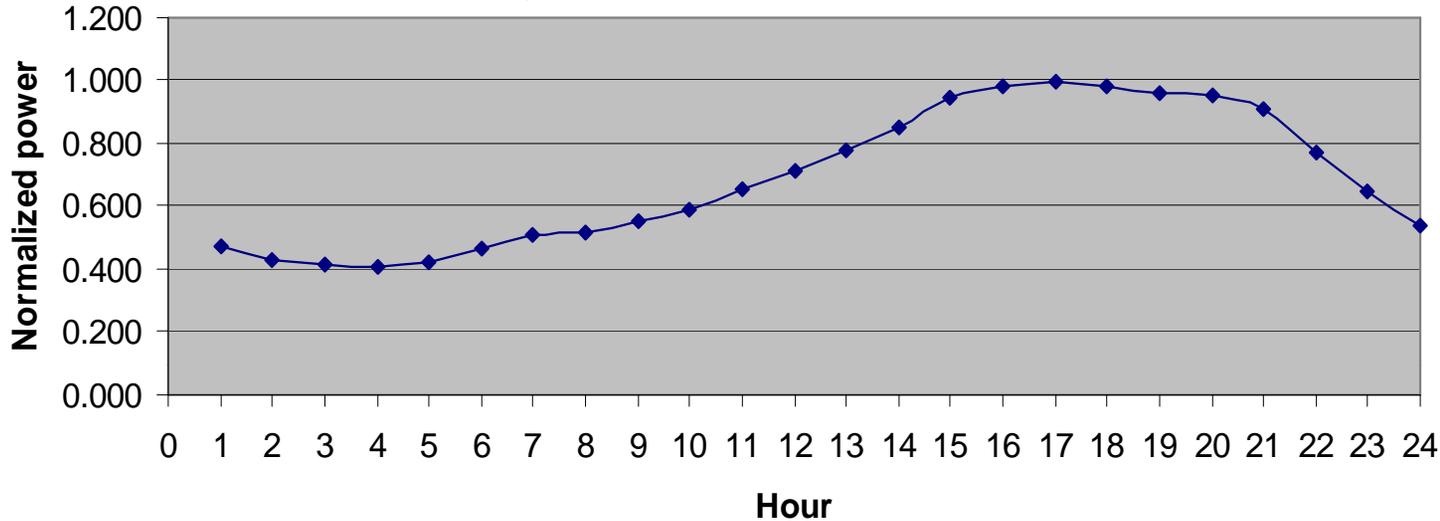

-  Agricultural
-  High density commercial
-  High density residential
-  Industrial
-  Low density commercial
-  Low density residential
-  Medium density residential
-  Mixed use of resid. and comm.
-  Open space and public lands
-  Planned development
-  Urban reserve
-  Very low density residential
-  Water

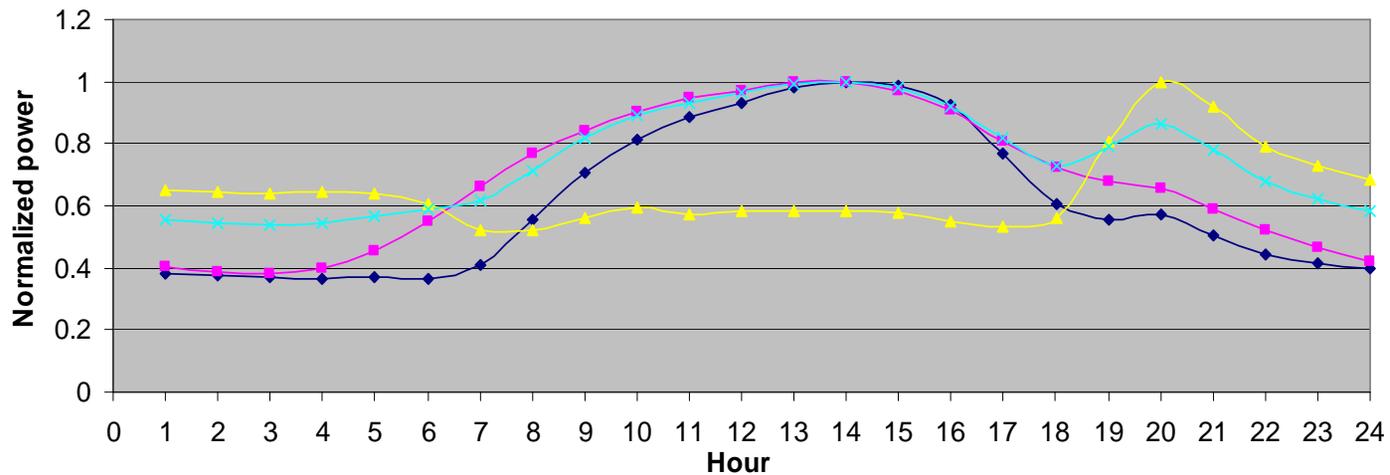

# How do we temporally allocate future technology?

Normalized hourly electric profiles for SCE residential sector

Normalized hourly electric profiles for SCE commercial sector

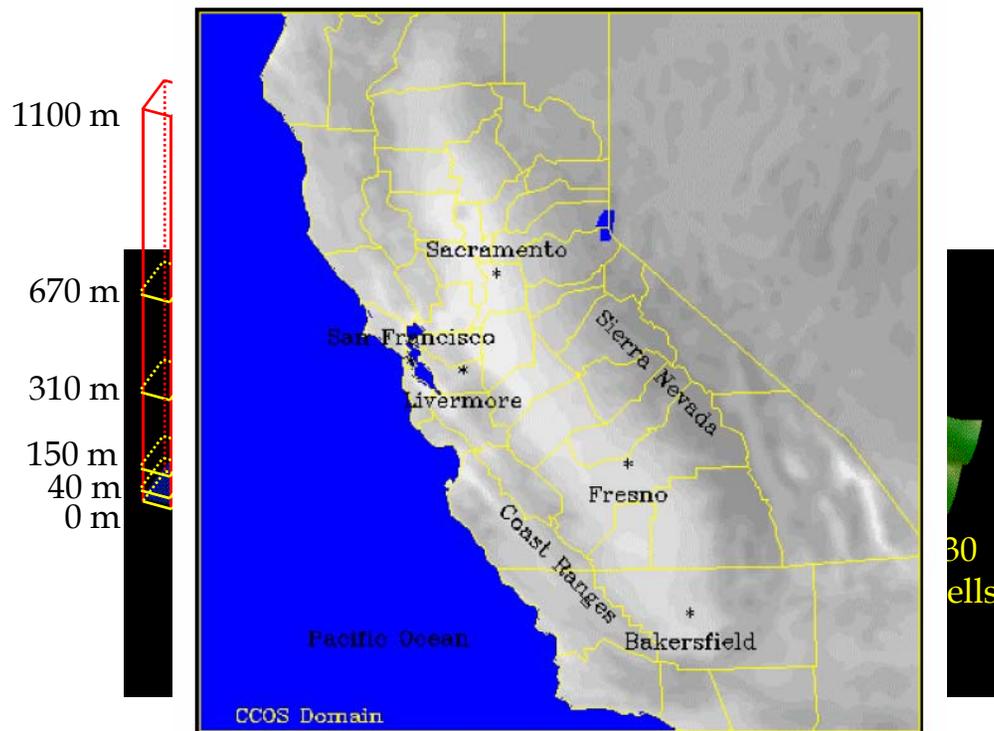

◆ Normalized GS-1     
 ■ Normalized GS-2     
 ▲ Normalized TOU     
 × Normalized GS-1&GS-2&TOU

# The Air Quality Model: UCI-CIT Airshed

## Governing Dynamic Equation:

$$\frac{\partial Q_m^k}{\partial t} + \nabla \cdot (u Q_m^k) = \nabla \cdot (K \nabla Q_m^k) + \left( \frac{\partial Q_m^k}{\partial t} \right)_{\text{sources/sinks}} + \left( \frac{\partial Q_m^k}{\partial t} \right)_{\text{aerosol}} + \left( \frac{\partial Q_m^k}{\partial t} \right)_{\text{chemistry}}$$

## Measured Meteorology:

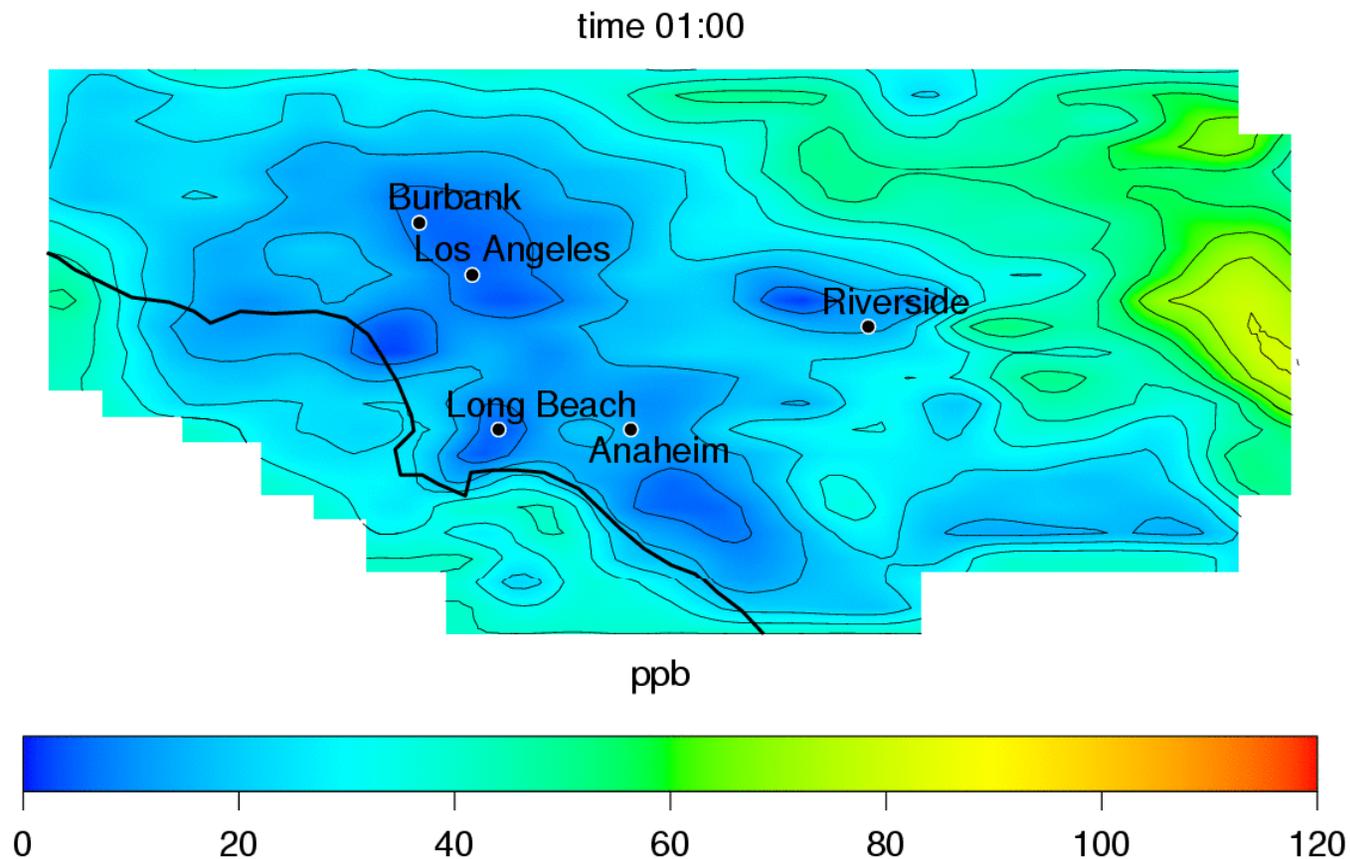

- Southern California Air Quality Study (SCAQS), Sept. 27-29, 1987
- Central California Ozone Study (CCOS), summer 2000
- California Regional PM<sub>10</sub>/PM<sub>2.5</sub> Air Quality Study (CRPAQS), Dec. 1999 – Feb. 2001
- High Ozone and PM concentration episodes

# Air Quality Baseline

## South Coast Air Basin Baseline Results in 2023:

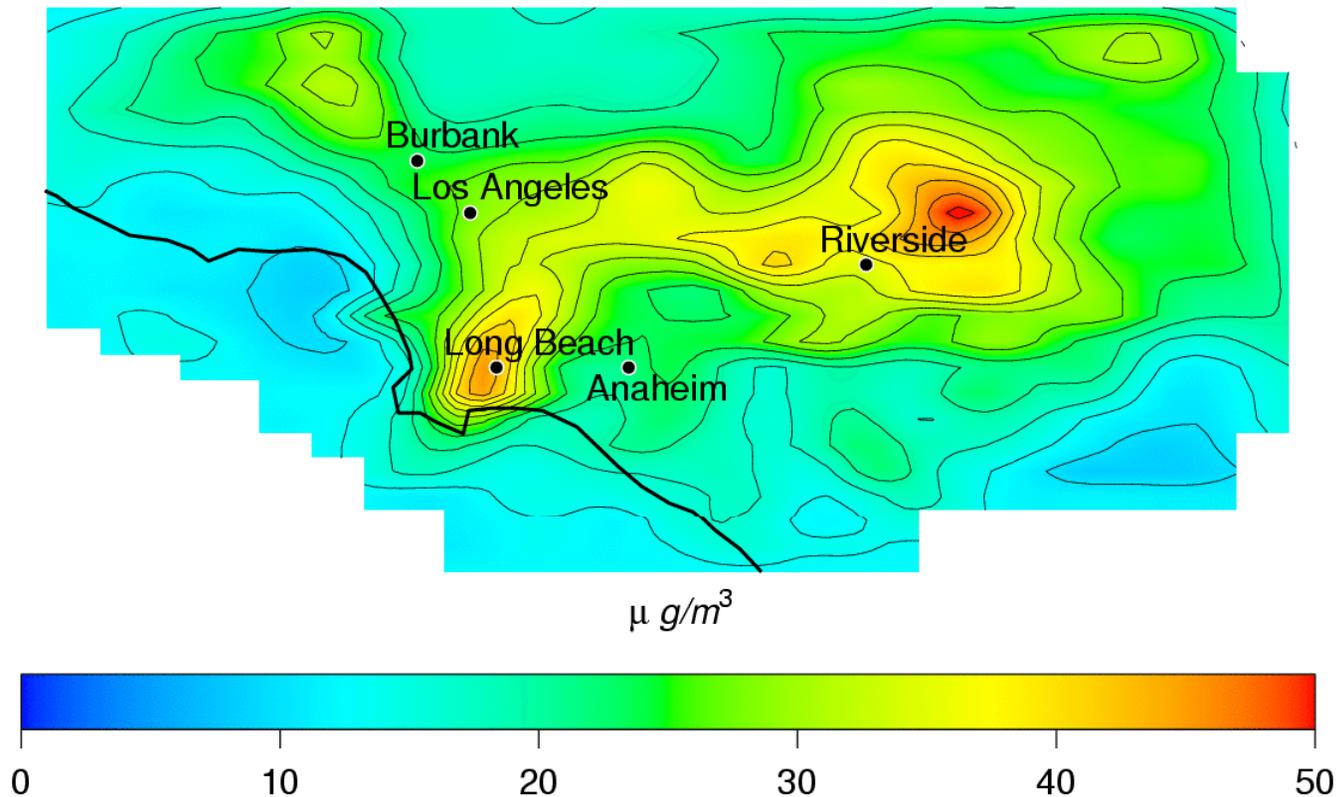

- Hourly ozone concentration:

# Air Quality Baseline

## South Coast Air Basin Baseline Results in 2023:

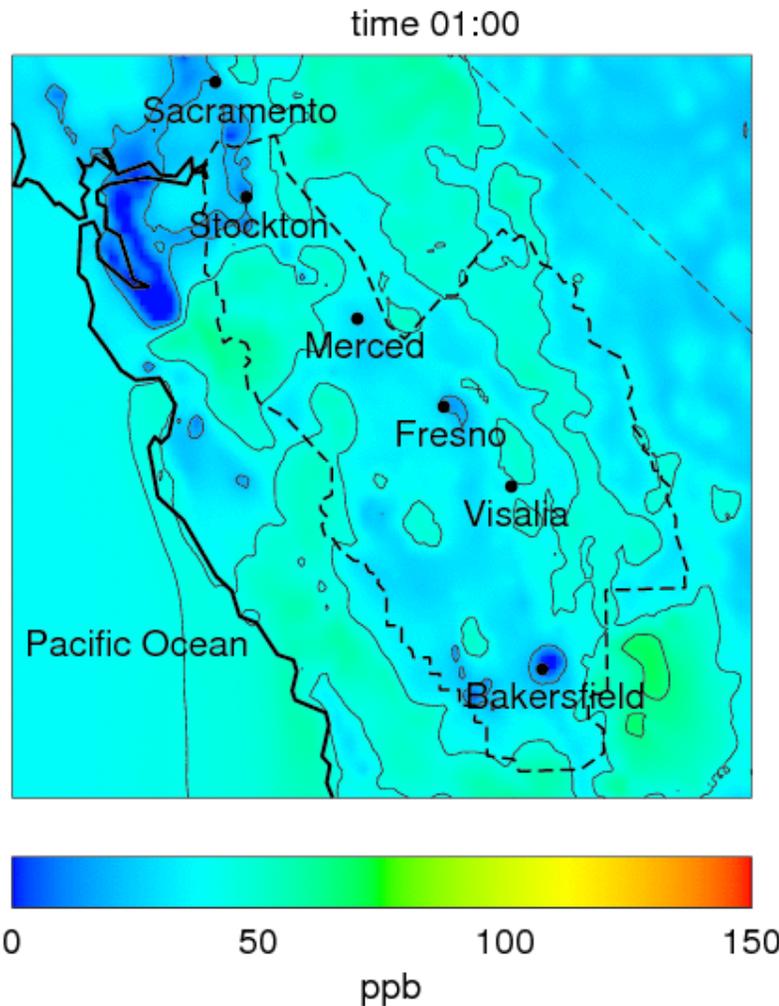

- 24-hour average of PM<sub>2.5</sub> concentration:

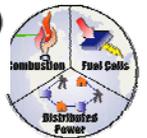

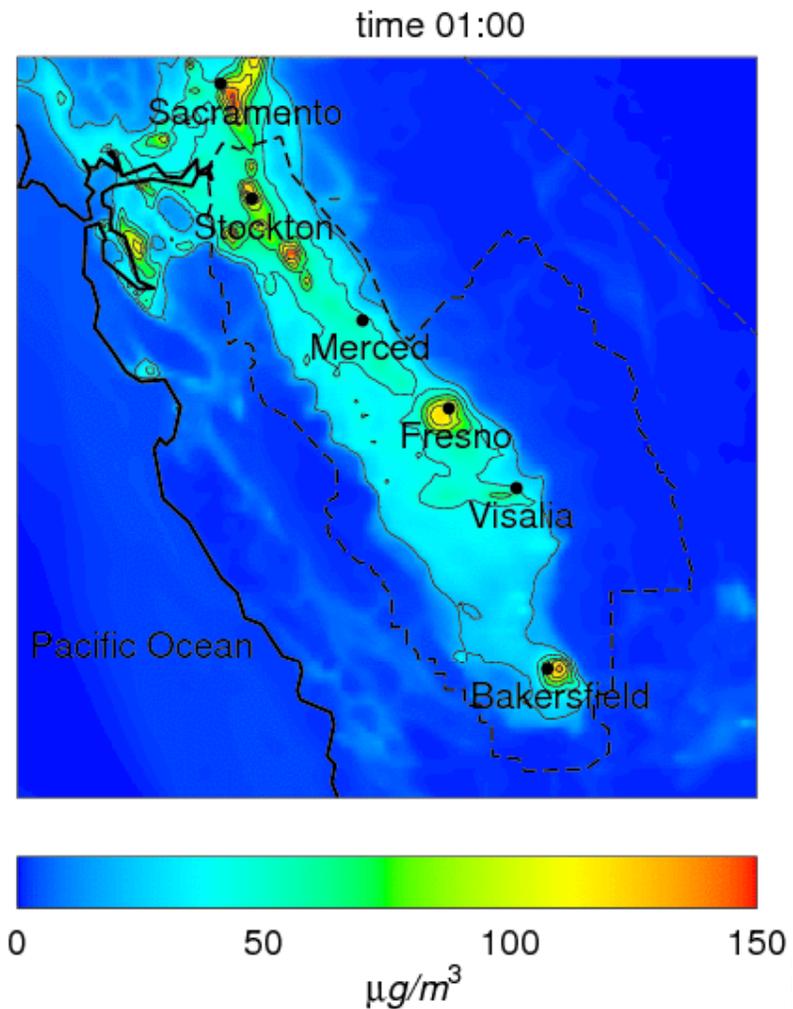

# Air Quality Baseline

## San Joaquin Valley Baseline Results in 2023

One-hour average ozone

One-hour average PM<sub>2.5</sub>

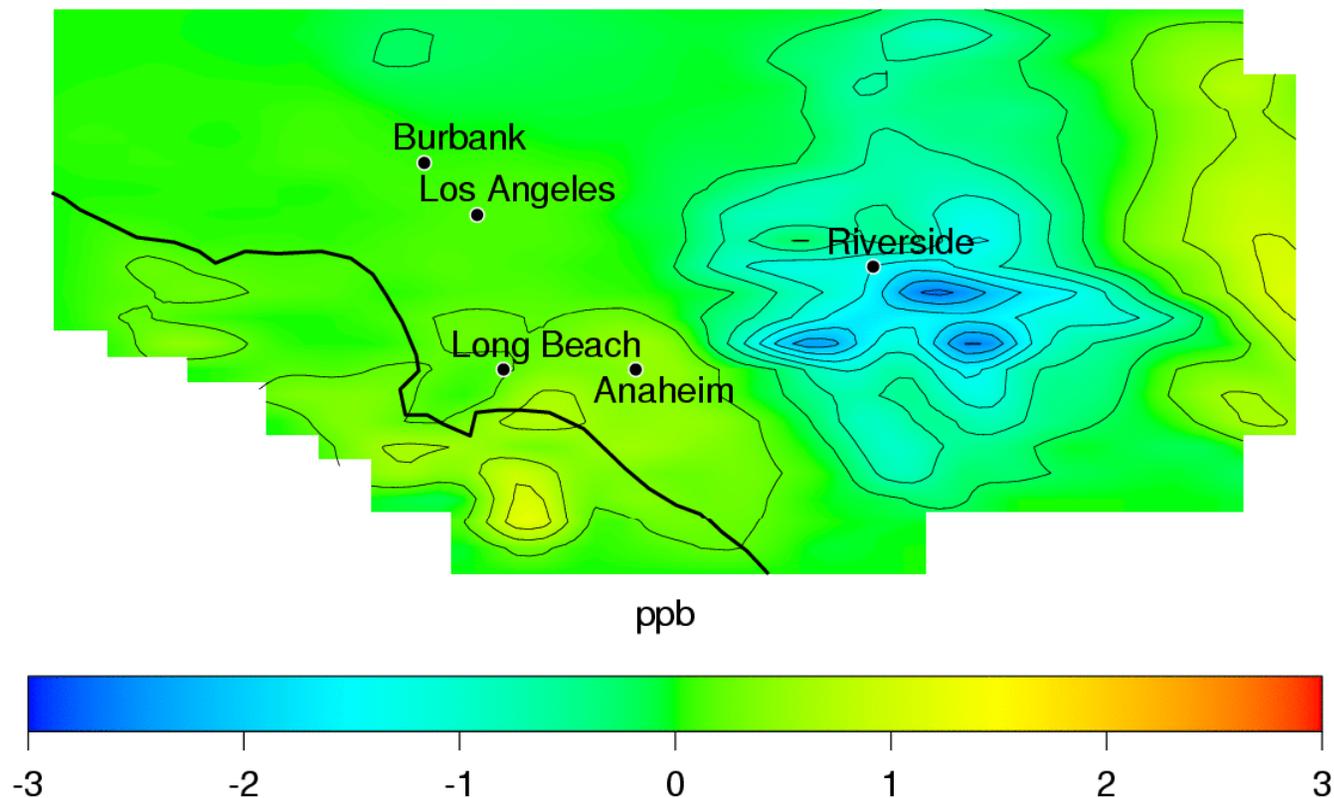

# Air Quality Difference Plots

Difference plots used to show significance of impacts:

- Example showing peak ozone concentrations that are displaced towards the east

time 01:00

# Outline

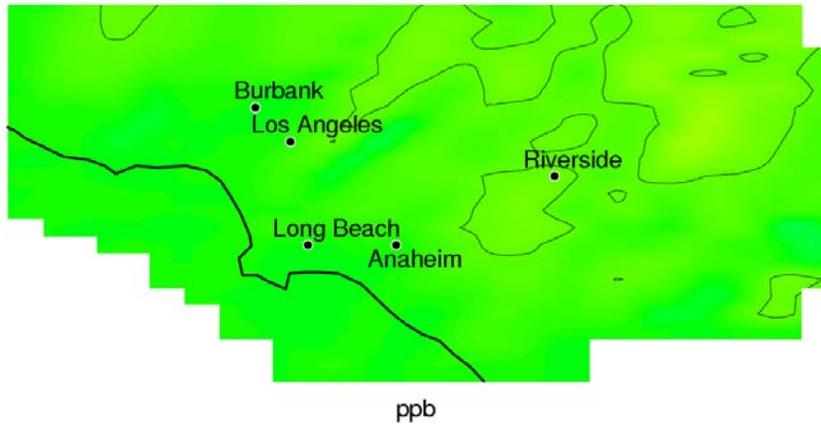

- Overview of Methodology and Tools
- **Regional Air Quality Impacts of Advanced Generation Technologies**
- Summary

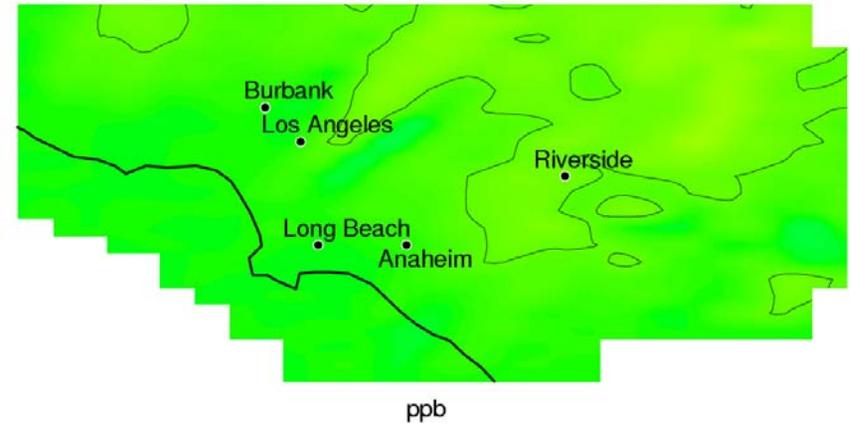

# Effects of DG Technology / Emissions Rates

## Ozone Difference Plots without CHP

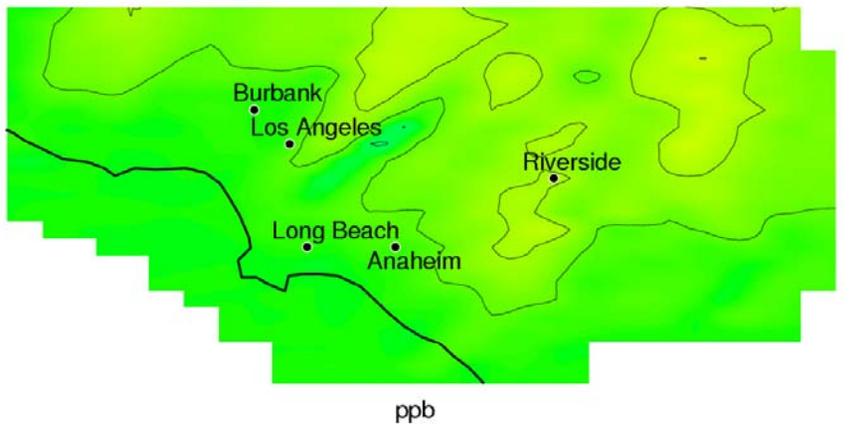

All Fuel Cell Case - Baseline

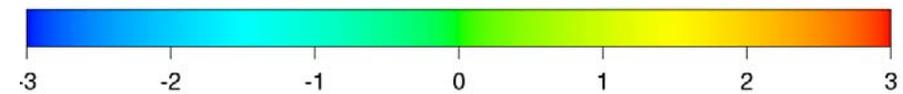

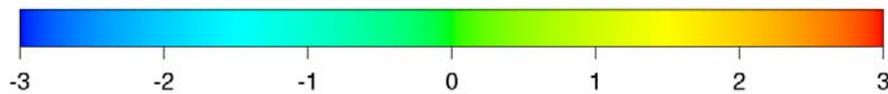

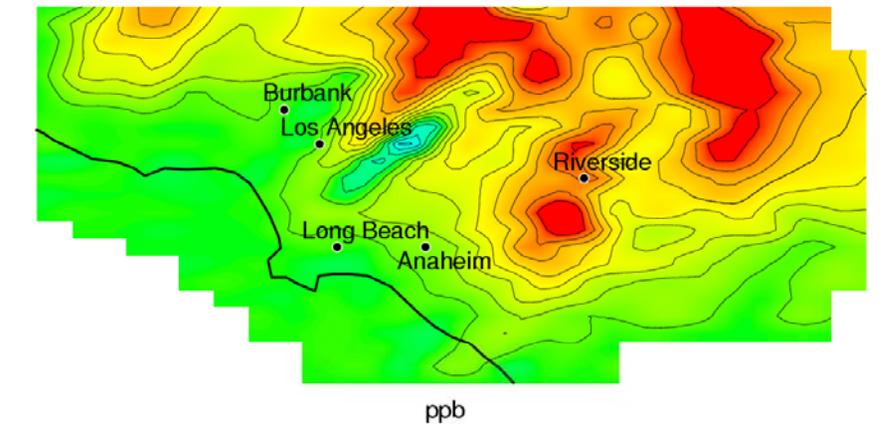

CARB Standard Case - Baseline

45% Market DG Mix - Baseline

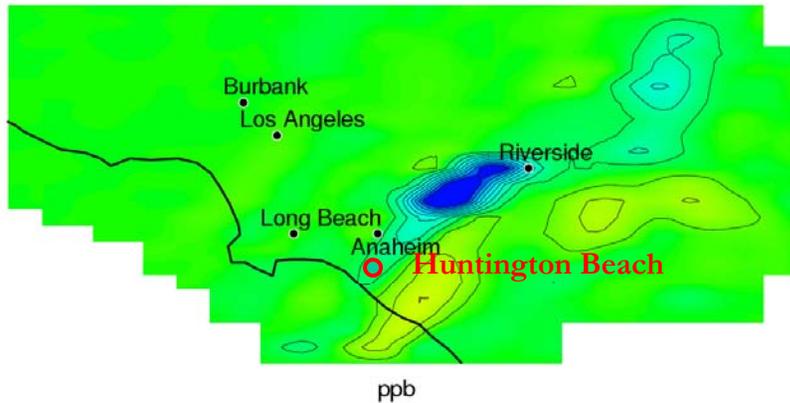

All ICE (BACT) Case - Baseline

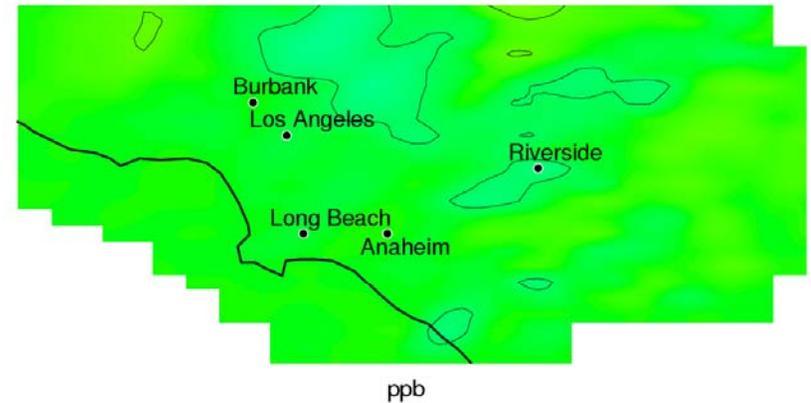

# Central Generation vs. DG: Air Quality

- Both scenarios introduce 1200 MW of new generation

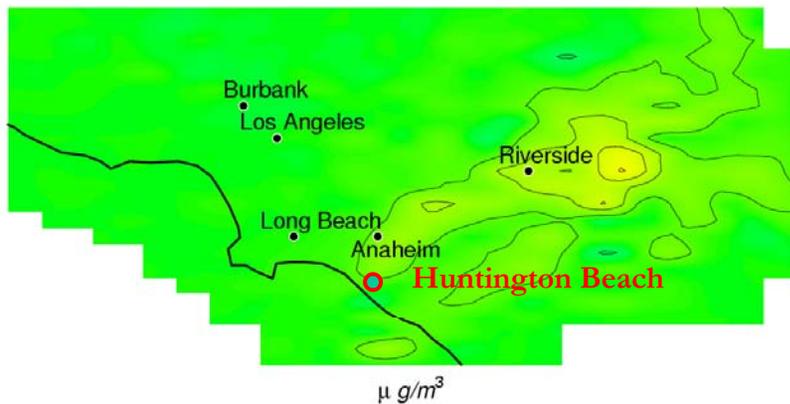

Peak O<sub>3</sub>: Normal CG – Base

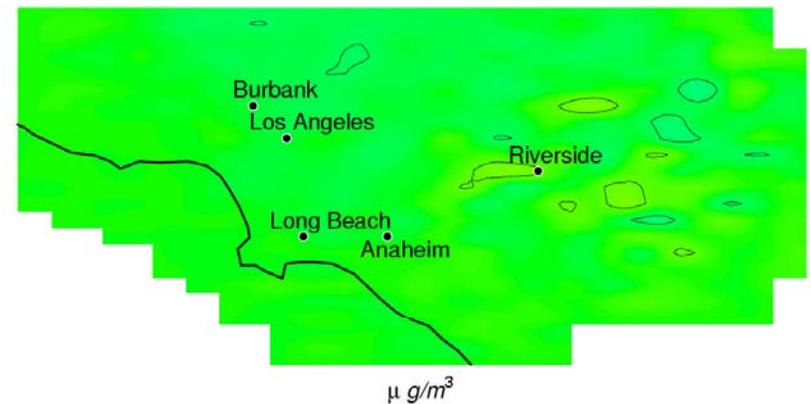

Peak O<sub>3</sub>: DG – Base

24h PM<sub>2.5</sub>: Normal CG – Base

24h PM<sub>2.5</sub>: DG – Base

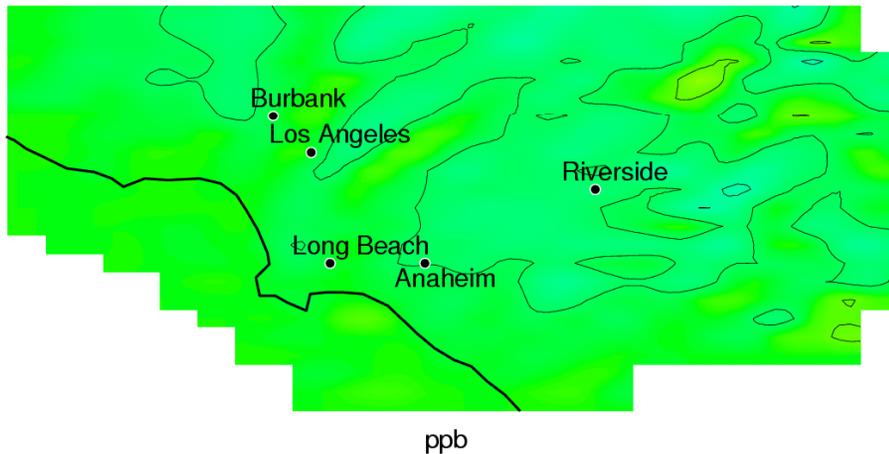

# Effects of CHP on Ozone

## Comparison of Realistic Scenarios with More or Less CHP:

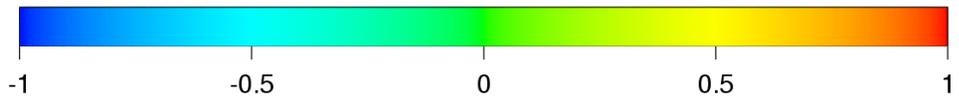

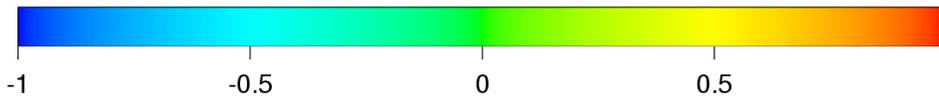

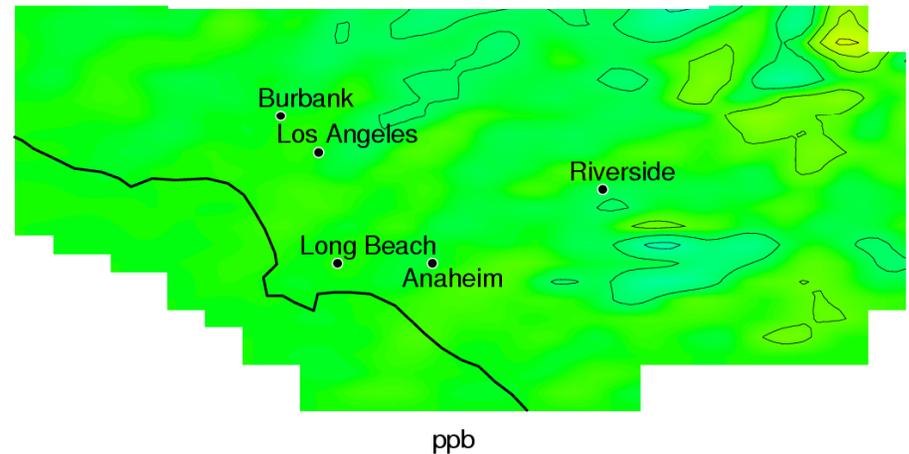

- DG meets 18% of increased power demand from 2007 to 2023
- DG Mix (~53% GT, ~33% ICE, ~4% FC, ~10% PV)
- More CHP: 60% of units; Less CHP: 10% of units (50% recovery)

Difference in peak  $O_3$  concentration

More CHP – Base Case

Less CHP – Base Case

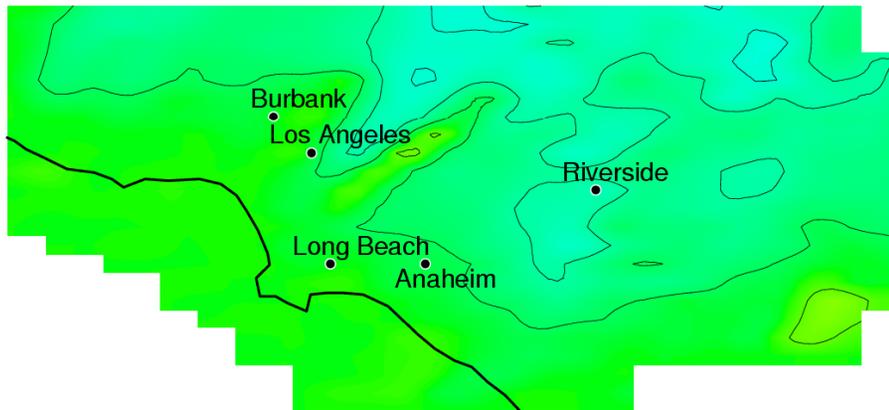

# Effects of CHP on Ozone

## Comparison of Land-Use Distributed Generation w/ & w/o CHP:

- DG meets 18% of power demand increase from 2007 to 2030
- All CHP case: all units include CHP (50% recovery)
- No CHP case: no units include CHP

Difference in peak  $O_3$  concentration

All CHP – Base Case

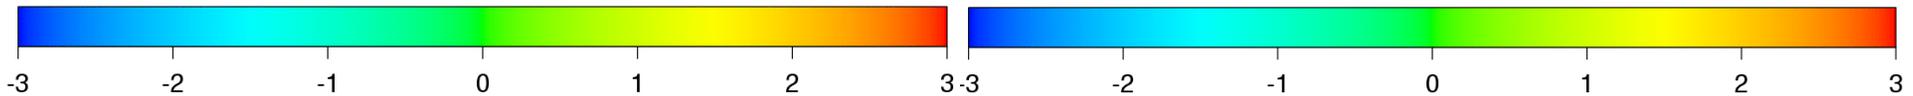

ppb

No CHP – Base Case

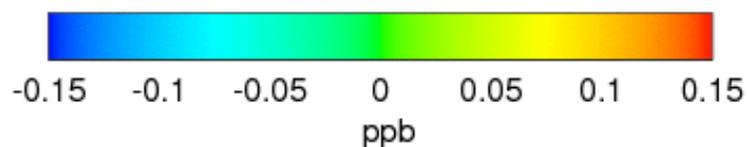

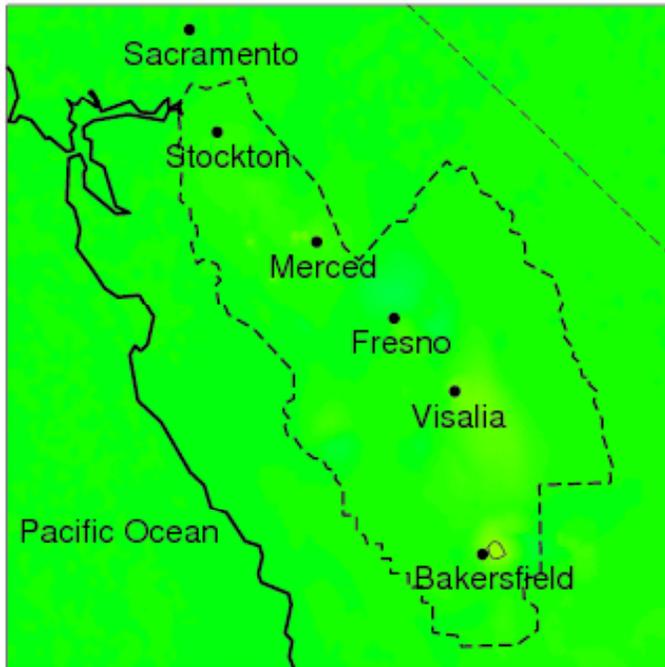

ppb

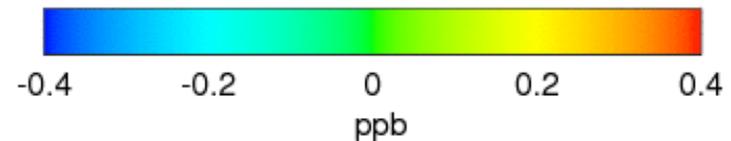

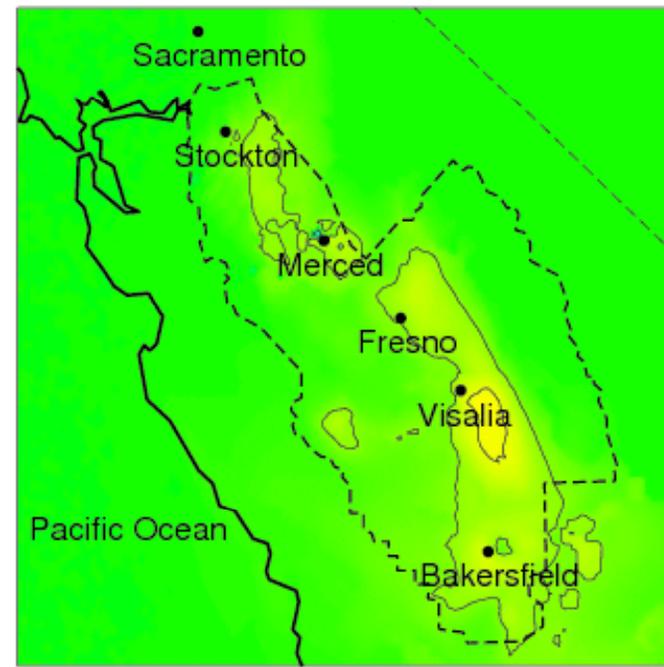

# Effects of CHP on Ozone

## NO CHP scenario predicts peak ozone impacts of 0.2 ppb

Increase in maximum one-hour ozone concentration for scenario R2 with CHP

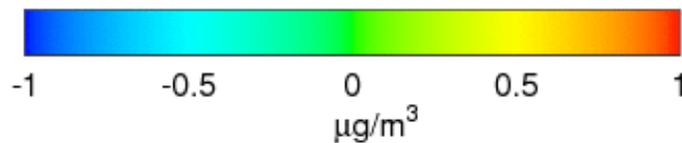

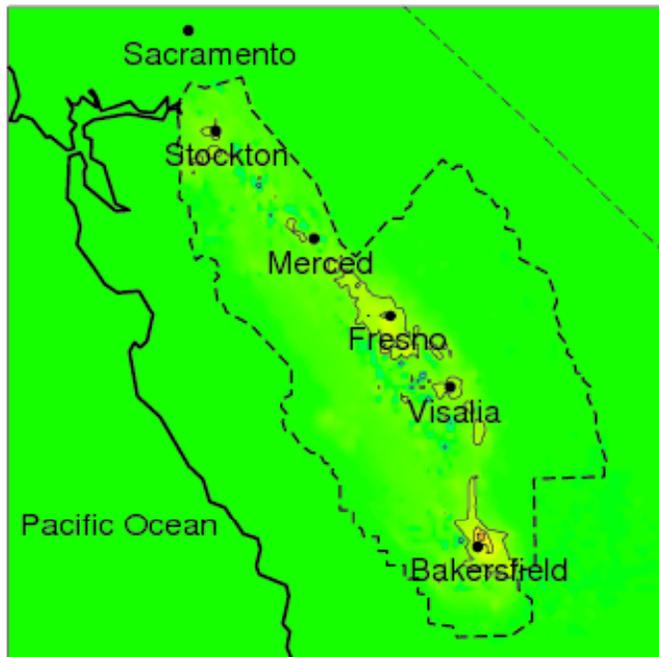

Increase in maximum one-hour ozone concentration for scenario NO CHP (same as R2, without CHP offset)

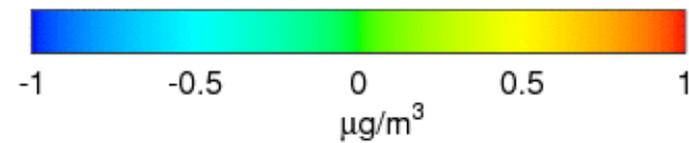

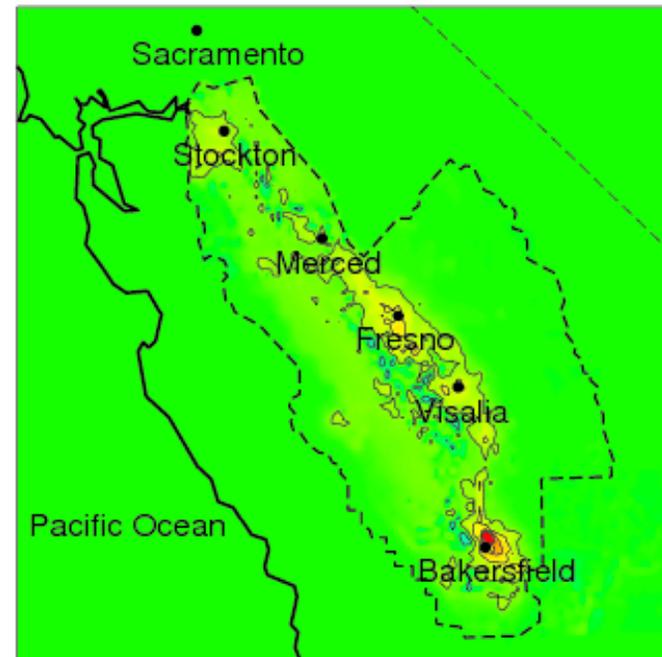

# Effects of CHP on Particulate Matter

## NO CHP scenario predicts peak impacts of $1.5 \mu\text{g}/\text{m}^3$

Increase in maximum 24-hour average PM2.5 concentration for scenario R2

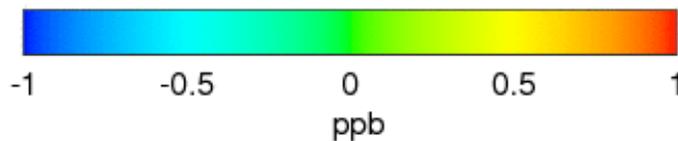

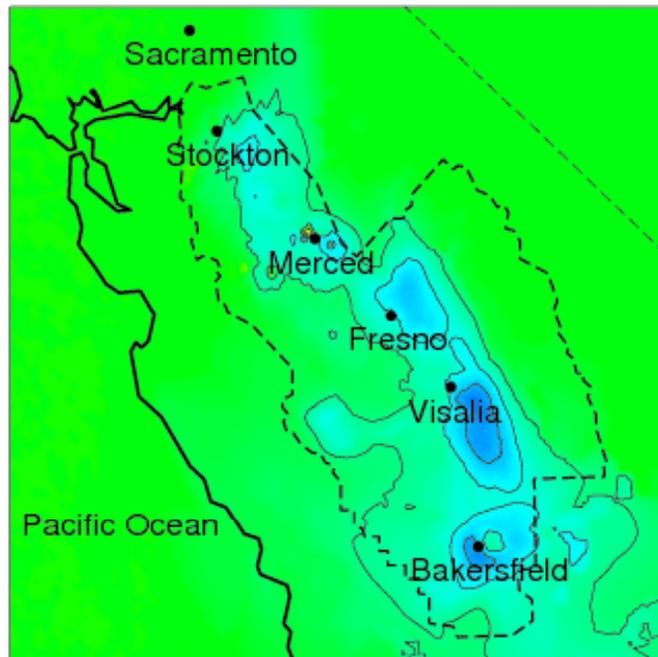

Increase in maximum 24-hour average PM2.5 concentration for scenario NO CHP (same as R2, without CHP offset)

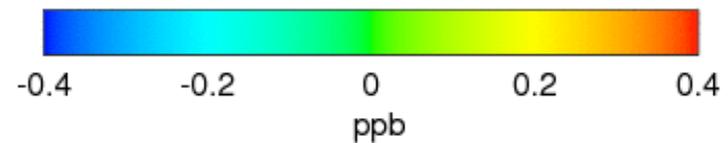

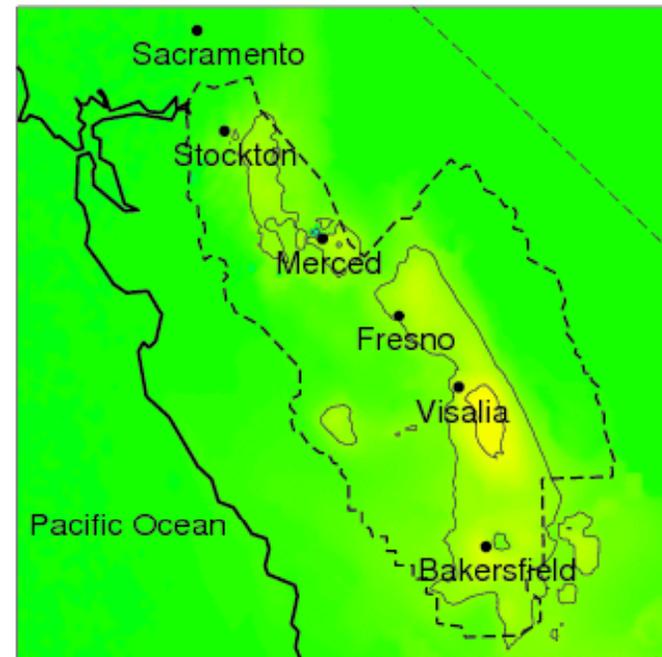

# Effects of CHP on Ozone

## ALL CHP scenario assumes 100% utilization of CHP and achieves decreases in ozone concentration

Increase in maximum one-hour ozone concentration for scenario ALL CHP (same as R2, 100% CHP offset)

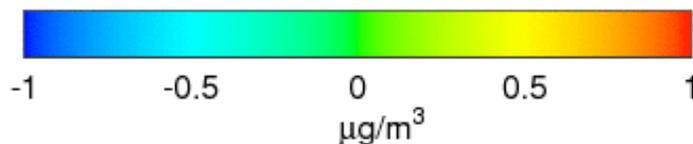

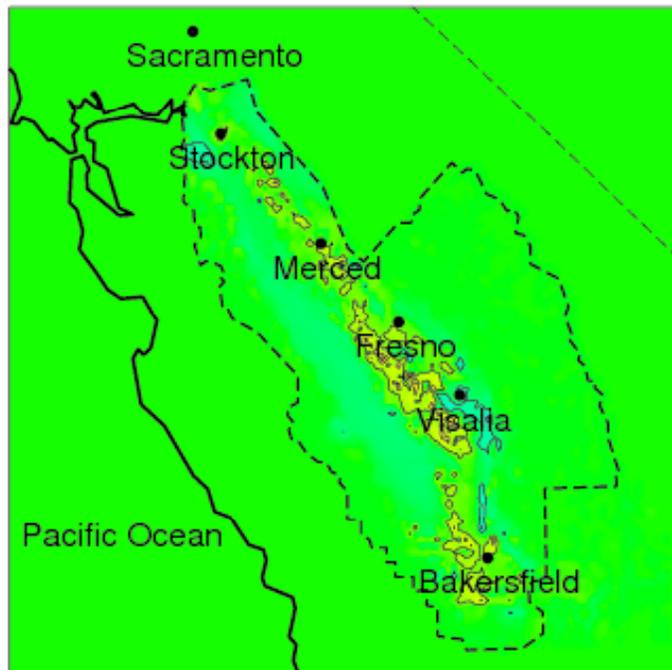

Increase in maximum one-hour ozone concentration for scenario NO CHP (same as R2, without CHP offset)

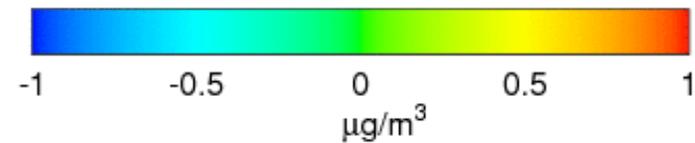

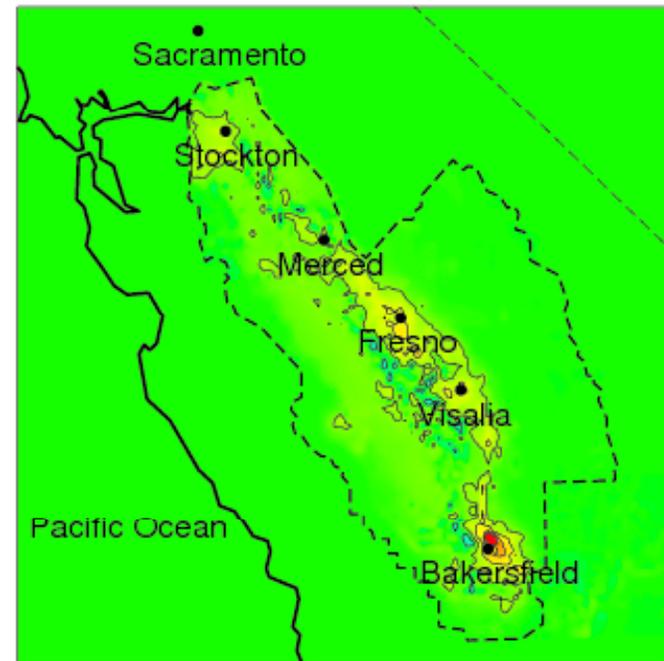

# Effects of CHP on Particulate Matter

## ALL CHP scenario assumes 100% utilization of CHP and has mixed impact on PM<sub>2.5</sub>

Increase in maximum 24-hour average PM<sub>2.5</sub> concentration for scenario ALL CHP (same as R2, 100% CHP offset)

Increase in maximum 24-hour average PM<sub>2.5</sub> concentration for scenario NO CHP (same as R2, without CHP offset)

# Outline

- Overview of Methodology and Tools
- Regional Air Quality Impacts of Advanced Generation Technologies
- **Summary**

# Summary

- **Energy Commission support has enabled UC Irvine to develop a unique methodology & toolset for rigorous spatially and temporally resolved analyses of energy and environmental impacts of future energy technologies**
- **The tools have been applied to understand air quality impacts of many future technologies (e.g., DG, PHEV)**
- **Low criteria pollutant emissions (e.g., those required by CARB and exhibited in fuel cell technology) are important to meeting air quality goals**
- **Combined cooling heating & power (CCHP) and combined heat & power (CHP) are known to significantly reduce GHG emissions**
- **Current rigorous analyses show that CHP also has significant air quality benefits in SoCAB and SJV**
