California Energy Commission  
Dockets Office, MS-4  
RE: Docket No. 02-REN-1038  
1516 Ninth Street  
Sacramento, CA 95814-5512

Attn: California Energy Commission

My name is Victor Hunt and I am the Vice President, Business Development for DyoCore, Inc. My position is to determine who can become a Distributor of our DyoCore products. My position started in September, 2010 when the company determined we were ready to launch our campaign to locate eligible Distributors.

I have sent a listing of our Registered Distributors to James Lee in a previous e-mail because we have had numerous people trying to sell our product without authorization. It is not only here in California, but it is happening nationwide. It is very difficult to police unauthorized users until after the fact when someone contacts us by either the CEC notifying us, or clients wondering if these people are part of our organization. Unfortunately, many of the problems you have encountered may have come directly from unauthorized companies claiming representation of our DyoCore products.

My function is to qualify each Distributor by making sure they are a legitimate company and that they are required to research two major factors BEFORE they become a Distributor. These two areas we require them to research are 1) Permitting in their respective areas, and 2) Verifying there is sufficient winds in their area. We strongly emphasize that we do NOT want our turbines installed in areas where there is no wind. I am very confident that our Registered Distributors completely understand these two points very well and have followed them without question.

We are all here to accomplish what the CEC has been set out to do. Your own mission statement states that your commitment to "Identifying and developing ways to streamline energy use" and to let "Californians know that using energy wisely is a good investment". You have been working since 1998 on the "Renewable Energy Program to help increase total renewable energy production statewide." The program you provide was for "market-based incentives for new and existing utility-scale facilities powered by renewable energy." You had a goal in 2006 to reach 20% by 2010, and now it has increased to 33% by 2020.

RECD. Apr 21 2011

The ERP initiative is to identify, develop and deploy this program. It was not intended to stop the market from developing new and better systems. This program was not intended to limit the number of companies who could use the funds which you know comes from approximately 75% of the taxpayers and energy company customers in the state. This program was not intended to limit who in California was capable of using the fund just because the available equipment was not built for them. You have done an excellent job in allowing the market to work for everyone. This temporary halt in the program is hurting Homeowners, Manufacturers, Distributors, Small Business Owners, Small Businesses and the CEC. The world watches the CEC for leadership in creating a better energy program for all. Your every move is critical not only for California and Californians, but economies worldwide.

We need to move forward quickly so you can accomplish your next goals of creating 33% of our energy from renewable sources by 2020. It is an ambitious goal that can only be achieved by providing the incentives as you have provided in the past. You can only accomplish these goals from “market-based incentives” as you have provided in the past, and should continue into the future. You will not reach this goal with the limited systems you previously had available.

Many of the new products on the market today will get us closer to this goal. Products like DyoCore’s SolAir will provide a larger percentage of end users of renewable energy. This is because we are the only company on the market today that has been able to break the cost barrier. We are the first company out there to reduce the cost of a system by at least one half. That is a remarkable feat. Our product has been tested, re-tested, and continuously improved so we can accomplish a greater percentage of energy out of a system. This is why this program is invaluable to our success, and yours.

I believe you already have a plan in place that is quite functional. It has created exactly what your intentions planned. You now have the tools to open the market to a greater number of people throughout the State of California and it is no longer limited to the chosen few as it was in the beginning of the program. The “old, fat, and happy small wind companies” of yesterday are scared of products like SolAir. That should tell you, in itself, that the ERP program has been successful in its intentions. If we followed the old, fat, happy logic back 100 years, we would all be driving Black Model T Fords today.

Sincerely,

Victor Hunt
