1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

There are SO MANY other alternatives to such a risky source of power, I WILL NOT VOTE FOR ANYONE IN FAVOR OF NUCLEAR POWER. thanks for your time.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water, food, and marine life with radioactive materials and forcing tens of thousands of people to abandon their homes. Even prior to this disaster the inherent risk of a nuclear accident and the indefinite radioactive waste outweigh ANY benefit to nuclear energy.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- the Diablo Canyon and San Onofre reactors are disasters waiting to happen on a scale like Japan.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace ASAP the 4400 MW of baseload electricity produced by the nuclear plant.
- 2) Recommend that the commission study how California residents, property owners, businesses, and marine life would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Renee Reinero

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

I have camped at Montana de Oro and listened the unholy whir of the reactor just around the corner, photographed around Los Osos and Morro Bay and traveled through San Luis Obispo wine country many times marveling at the sirens on telephone poles there to warn citizens and wine sippers the inevitable has happened and they better drink up before they melt down. It's not a risk worth taking. Follow Germany's lead and decommission this ticking time bomb.

I used to attend UCSD and would always pass by San Onofre en route. It should also be decommissionedd.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Dear Commissioners:

I have always been concerned about the possibility of the San Onofre Nuclear Plant becoming damaged by an earthquake beyond its capacity to contain nuclear emissions. The melting nuclear reactors in Japan have convinced that I was right in being concerned. Close all nuclear plants. Start with ones on fault lines and those that are vulnerable to tsunamis first, then the rest. It is beyond belief that we keep producing more nuclear waste when we cannot yet and probably never store it safely. We are fools

I live fairly close to San Onofre. So I am at risk from foolish policies.

I want you to fight to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Here are some specific recommendations for the Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs.

Thanks for having the common sense to prevent the possibility of a major nuclear catastrophe.

Sacramento, CA 95814-5512

Dear Commissioners:

I am most concerned that nuclear reactors at Diablo Canyon and San Onofre cannot withstand major earthquake activity that we KNOW is likely. We all watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. Such a scenario is NOT unlikely in California since our reactors are just as close to population centers and agriculture as well as the Pacific Ocean. As a California ratepayer and resident, I ask that you do everything you can to make sure that does NOT happen here in California.

Nuclear reactors do not belong in active seismic zones!!

I believe, the Diablo Canyon and San Onofre reactors should be replaced with clean, renewable energy and energy efficiency technologies. As the Energy Commission considers what California's energy future should look like, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

Let us be prudent and courageous at this time.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Carl Stilwell

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

We need work on developing clean, renewable energy resources like solar and wind. So many of my friends and family live along the coast in San Luis Obispo county very near aging the Diablo Canyon power plant. I really don't want to see anything happen to them or their children. There are also wetlands near there that are the habitat for many flocks of birds and schools of fish. The Morro Bay estuary is an important breeding ground and nursery for all sorts of wildlife. We need to work on shutting these old plants down when their licenses expire and replace the power they generate with safe, renewable and efficient technologies. Right now they are ticking timebombs.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes contaminating all of Japan, the Pacific, and even the west coast of North America.

I do NOT want failure of nuclear reactors to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose nearly identical risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources ASAP.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

As a long time PG&E rate payer I remember having to pay a premium in my electric bill to cover the cost of decommissioning Diablo Canyon nuclear plant. I thought this premium was actually to decommission this facility. So why isn't it done? What happened to this money?

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. John H. H Anderson
4042 Albatross, Apt 38

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Rosalind Bresnahan

Dear Commissioners:

I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Don't you realize that if there is any sort of "accident" and the radiation gets in to the ocean, it will spread via the currents - WORLDWIDE - AND NOTHING CAN BE DONE – MANY MILLIONS OF PEOPLE COULD DIE AS A RESULT – AND THE QUALITY OF THE LIVES OF ALL HUMANS AND LIVING THINGS WILL BE DOWNGRADED. All living things in the seas will be contaminated by radiation for hundreds of thousands of years. What has gone on in Fukushima has made those areas unlivable and the marine life radiated - permanently. You should invest in wave power, wind and solar. If you don't and there is an "accident" - just think about your children and grandchildren - if you care about them. It's stupid to use nuclear and oil and coal. The people who are promoting these are highly paid to do so. They don't care about the earth, or future generations. Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Los Angeles, CA 90029-3685

323-687-3618

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

After Japan's nuclear plant crises I have no interest in a nuclear plants in California California earthquake state. As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster.
