Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Margaret Morrison

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors. Nuclear energy is not clean energy. The waste generated is one of the dirtiest most harmful materials that can be produced. And our old California reactors are a disaster waiting to happen. Please do the right thing. Close the reactors. Look to other more viable and clean energy sources.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

IT'S TIME WE FOCUS ON ALTERNATIVE ENERGY AND LET THAT BE THE GEAR TO GET OUR ECONOMY RUNNING AGAIN AND OUR FUTURE SAFE!

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission

recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Monte Leach

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. The commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Chung-Wei Chan

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Dear Commissioners:

ALL GREEN NOW! NO NUKES EVER! DEATH TO NUCLEAR POWER!

In fact FUCK YOU for EVER allowing Nukes.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

GO GO GODZILLA!

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission

recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Barri Rosenblum

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California taxpayer, ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, and then the continuing contamination of soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes and the accumulating costs to health, property, environment and business and economy.

Why is California unnecessarily playing Russian Roulette with old, troubled and outdated nuclear reactors. The catastrophic risks in no way outweigh the benefits. And a disaster will not be momentary, the radioactive devastation will continue for generation after generation. Agriculture devastated, tourism devastated, economy devastated, habitat for humans and animals devastated...

I live close to San Onofre, what happened at Fukushima I do NOT want to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen, and the responsibility falls on you to protect lives first.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that reactors are closed and replaced with clean, renewable energy and energy efficiency technologies starting NOW.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources before 2025, when the originally designed and licensed lifetime of last of the reactors will expire. The sooner the better, we have no way of knowing when the next earthquake will strike.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic

vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our seismic and sun-rich state toward a future free of unnecessary dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Jim Rosvall

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mrs. Martha and George Robin
2940 Van Ness Avenue #6
San Francisco, CA 94109

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

Moreover, I believe that nuclear is not really "clean energy" as the cost and materials needed to construct and maintain nuclear reactors are not environmentally friendly, especially since those funds should be used to develop renewable energy sources in California such as solar, wind, geothermal and wave power.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around

California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

DONALD BARRETT

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly

sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

May Ellam

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre may pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- I am concerned that these reactors may be disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are either brought up to serious safety standards or replaced with ones using more modern designs. We're going to need nuclear power as a wedge for getting off fossil carbon, and we can't afford to have a nuclear disaster spooking people away from the newer, safer designs like pebble-bed and thorium reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and carbon-neutral energy sources by 2025, when the originally designed and licensed lifetime of the last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a century-long offsite solution to safely store highly radioactive waste. (We don't need to store it for thousands of years, just long enough that it becomes efficient to burn the stuff in breeder reactors.)
- 4) Recommend increasing the emergency planning and evacuation zones around

California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future of clean, safe energy.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Bridget Burnham

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

(619) 473-0174

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

Having watched in horror as the nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes, I do NOT want that to happen here in California.

I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines --and near major population and agricultural areas-- these reactors have the potential to be as disastrous as those in Japan.

As the Energy Commission considers what California's energy future should look like, please ensure these reactors are scheduled for closure and replaced with clean, renewable energy and energy efficiency technologies.

As part of the Energy Commission's Integrated Energy Policy Report (IEPR) for 2011, please address the following:

- 1) Recommend appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

- 3) Recommend the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

John Peha

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Dear Commissioners:

I have been researching the repository at Yucca Mt. (which is not presently being considered, I realize) and have come to the conclusion that we already have too much hazardous nuclear waste. Nuclear energy is not where we should be putting our efforts.

We need to put research money and effort into clean renewable technology and stop producing any more nuclear waste. The waste we already have cannot be reprocessed safely and cheaply.

Please read the following link from Union of Concerned Scientists:

http://www.ucsusa.org/nuclear_weapons_and_global_security/nuclear_terrorism/technical_issues/reprocessing-and-nuclear.html

Thank you for your time.

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dr. Mark Escajeda
859 Santa Maria Way
Lafayette, CA 94549-5154

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

I am personally dissatisfied with the safety of spent fuel storage in the United States, and have observed with concern the proposed fixes that have been presented, especially burial in salt formations in New Mexico.

Do we really want to see nuclear tanker trucks traveling on our freeways daily all over the US? What does Homeland Security think about that?

Do we really want to bury hot nuclear waste in metal canisters in salt, which has a melting point of 1400 degrees F? How do we know that the area will continue to be stable seismically?

I am not sure these questions can be scientifically answered with certainty.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I DO NOT WANT that to happen here in California, and I am VERY CONCERNED that our decades-old nuclear reactors at Diablo Canyon and San Onofre POSE SIMILIAR RISKS. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) REQUIRE that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) REQUIRE that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) REQUIRE that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) REQUIRE INCREASING the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

In 1958 ALL mother's milk - worldwide - was contaminated with strontium 90 from nuclear bomb testing; this led to a BAN on above ground nuclear testing. What is needed RIGHT NOW is the shut-down and dismantling of nuclear power plants world-wide, and certainly in California. I was 12 years old in 1958 and lived 45 miles from the Pantex nuclear bomb factory in Texas, where the Geiger counter in my high school was OVER the maximum allowable amount of radiation every second of every year and many people in the area died from bizarre forms of cancer, including two of my grandparents. I also lived three miles from a nuclear power plant in Oregon, and am a liver cancer survivor, my liver cancer being caused in my opinion by overexposure to radiation.

We went through atomic bomb drills in grade school. These 9.0 quakes can happen all over the world. How frightening and stupid is it that the Diablo Canyon Nuclear Power Plant in San Luis Obispo County, California, is FOUR BLOCKS from an earthquake fault???

I think we should focus our energies on something we can do something about, which is dismantling our nuclear power plants. Because Los Angeles is about 150 miles from Diablo Canyon and a San Onofre meltdown would affect not only the 14 million people in the Los Angeles Basin but also more millions in Southern, Central, and Northern California – and these plants are much closer to Los Angeles than the six nuclear reactors in Japan are to Tokyo.

We can no longer afford nuclear power and nuclear waste for which there is no safe storage site on this earth. We would be fools if we ignore the damage that a 9.0 earthquake could do to not only the eighth-largest economy in the world, but to the 37 million people who live here. No scientist, no matter how knowledgeable - can say with certainty that a 9.0 quake will never happen here. There have been at least seven earthquakes approximating 9.0 since 1952, six of these on the Pacific Ring of Fire on which California is situated.

We owe it not only to ourselves but to our posterity to be a good and responsible caretaker of this earth and shut down nuclear power worldwide. NOW.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

(1) In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the

commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

2) Recommend that the original Certificates of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be revoked.

3) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 200 miles and beyond, and analyzing the associated costs until they can be dismantled.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. And as we know from the nuclear bombing of Hiroshima and Nagasaki, long-term damage and casualties from a nuclear catastrophe are a certainty which we must avert in California by closing San Onofre and Diablo Canyon Nuclear Power Plants.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines - near major population and agricultural areas - these reactors are catastrophes waiting to happen.

California's two nuclear sites -- Diablo Canyon and San Onofre -- are both vulnerable to earthquakes and tidal waves and they have highly radioactive waste piling up onsite. After the Tohoku Japan earthquake on March 11 of this year, the ocean waves from the resulting tsunami which hit California were choppy for two months.

Clean, renewable energy sources and efficiency technologies could easily replace the electricity provided by nuclear reactors. Yet utilities PG&E and Southern California Edison want to keep their reactors running for decades beyond their originally designed and licensed lifetimes. These licenses should not be extended – and it is the responsibility of the California Energy Commission to take the forward-looking and wise view that has propelled California to the top ranks of civilization and recommend that these plants be closed.

These plants are nuclear bombs waiting to go off, which it is within your power to prevent.

Thank you for your prompt consideration in this serious and pressing matter.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

Californians watched with horror the Fukushima nuclear disaster.

Not only were we saddened by the desolation suffered by the Japanese people but we know that our decades-old nuclear reactors at Diablo Canyon and San Onofre are similarly at risk. Sitting directly on the coast along earthquake fault lines near major population and agricultural areas, these reactors are disasters waiting to happen.

I urge you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

As part of your Integrated Energy Policy Report (IEPR) for 2011 please recommend the following::

- 1) That the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally licensed lifetime of last of the reactors will expire.
- 2) That the commission study how California residents, property owners and businesses would be "made whole" if a Fukushima-level disaster struck the state. Damage estimates from Japan's nuclear disaster exceed \$230 billion. The commission should recommend that the federal government reassess the \$12 billion cap set by the Price-Anderson Act on utility companies' financial liability for nuclear accidents.
- 3) That the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) That the emergency planning and evacuation zones around California's reactors be increased from 20 to 50 miles and beyond, and the associated costs be analyzed. The U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Please give serious attention to these comments and help our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

I'm writing to strongly urge you to close the nuclear power plants at Diablo Canyon and San Onofre. These plants are near fault lines and face the risk of earthquakes and/or tidal waves stronger than these plants were designed to withstand.

Furthermore, it has recently been revealed that the plant at Diablo Canyon ran for a year and a half with some emergency systems disabled. I have no reason to believe that the state of California has the capability nor the political will to ensure that these plants are operated safely, even in the absence of a natural disaster.

Finally, all nuclear power plants produce radioactive waste that remains an extreme hazard for decades.

In light of the above, I can only conclude that these nuclear power plants are a grave public threat and must be shut down as soon as possible.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Ms. Alice Kelly

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Dear Commissioners:

As California ratepayers and residents, we watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

We do NOT want that to happen here in California, and we are concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

Perhaps even more disastrous is the lack of a safe nuclear waste disposal strategy.

As the Energy Commission considers what California's energy future should look like, we want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, we would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly

sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mark Cappetta

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

We must move toward SAFE energy to ensure the survival of this AND future generations!

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. Rick Shreve
501 9th St.
Arcata, CA 95521

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Barbra Bergstrom

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Sacramento, CA 95814-5512

Dear Commissioners:

As nuclear reactors in Japan melted down, contaminating soil, water and food and forcing tens of thousands of people to abandon their homes, I watched with horror..

I'm terrified that might happen here in California, and concerned our decades-old reactors at Diablo Canyon and San Onofre pose these risks. They sit directly on earthquake faults near major population and agricultural areas; these reactors are literally time bombs.

As Energy Commissioners consider what California's energy future should look like, I urge that you QUICKLY ensure the reactors are closed. And then, use clean, renewable energy efficient technologies to replace them.

Specifically, I want the Energy Commission to make recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) That appropriate government agencies and utilities then immediately determine how to replace 4400 MW of base load nuclear-produced electricity rendered unusable by earthquake/disaster. Studies need then determine how baseload generation will be replaced by energy efficient, new energy sources by 2025 (when originally designed/licensed lifetime of last of these reactors expires.
- 2) Recommend that commission study how California resident systems would rebuild when disaster strikes. Damage estimates from Japan's nuclear disaster exceeded \$230 billion. Commission should recommend the federal government reassess the \$12 billion cap on liability of utility companies nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original San Onofre and Diablo Canyon Public Convenience/Necessity Certificate issued be reviewed: consider new information on seismic vulnerability, increase in population near reactors, and continued lack of permanent, safe off-site solution to store high-level radioactive waste.
- 4) Immediately increase emergency planning/evacuation zones around California's reactors to 50+ miles (now just 20), analyzing associated costs. The U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate similarly sized areas.

Thank you. Again, please consider these comments and move our state toward a nuclear-free future.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Thomas Anderson

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I have never been in favor of nuclear power plants (it's pure insanity to build something without a viable plan to dispose of it's lethal waste), and I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly

sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors. Nuclear reactors are dangerous and produce radioactive waste that can't be safely disposed. The potential of naturally occurring events such as strong earthquakes here in CA is real and not a distant hypothesis!

There fore everything should be done to decommission and finally shut down these nuclear power plants, then focus on a dry cast and final storage solution for the nuclear waste before disaster strikes, instead of subsidizing an old and brittle technology that guaranties a nuclear waste-land with almost unpredictable ramification, but certain dire consequences at tax payer's expense as we now can witness in Fukushima and beyond.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
