Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Penn Valley, CA 95946

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

Proponents of nuclear power plants often highlight the fact that these facilities emit no greenhouse gases which, while a powerful rationale in their favor, generally ignores equally serious problems of proliferation, terrorist vulnerability, the need to isolate and store radioactive waste products essentially forever, the prohibitive expense of building these plants, and the very real environmental and health risks associated with potential nuclear accidents.

Much like the Deepwater Horizon oil spill in the Gulf of Mexico, recent events in Japan have focused public attention on some of these less savory aspects of the true cost of nuclear power. Consider also that reports by the Rocky Mountain Institute (A nonprofit research and educational foundation aiming to foster efficient and sustainable use of resources. <http://www.rmi.org/>) revealed that, "In 2006, distributed renewable power sources worldwide got \$56 billion of private risk capital; nuclear projects got zero." Private capitalists are unwilling to finance nuclear plants because they are considered both overly costly and excessively risky.

As a mother of two and a concerned citizen, I am opposed both to nuclear energy and to using taxpayer dollars to subsidize an industry which is so inherently dangerous and unsustainable.

A severe nuclear power accident, like the one that occurred in Japan, could happen here in the United States--and in our state--with potentially devastating human, environmental, and economic consequences.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen. It's a matter of when, rather than if.

I therefore urge you to ensure no additional nuclear reactors are built in California, that nuclear power be phased out in this state, and that the appropriate agencies take immediate steps to improve nuclear power plant safety and security at existing facilities until such time as they can be permanently taken off-line.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be “made whole again” if a Fukushima-level disaster struck the state. In light of damage estimates from Japan’s nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies’ financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California’s reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

The citizens of our state deserve to be protected against the known risks associated with nuclear power. I’m counting on you to take concrete steps to reduce these risks now, so Californians will never have to face a nuclear accident here at home.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. ROBERT K MORGAN

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes, forcing children to go to school with dosimeters required on them at all times, and food/milk/water showing up in world markets with dangerous levels of cesium, strontium, and iodine in them.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near significant and major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable, safe, environmentally sound and green, and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act. This clearly is wholly insufficient to financially mitigate such a disaster.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, it is significant that the U.S. Nuclear

Regulatory Commission recommended that residents within a 50-mile radius the Fukushima reactors voluntarily evacuate that designated amount of area. Why aren't we following such a mandate?

Thank you for considering these comments and for moving our state toward a future free of dangerous and completely unsafe nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:
NUCLEAR POWER IS NOT GREEN POWER!

It's so dangerous the mind boggles.

PLEASE CLOSE ALL U.S. NUCLEAR POWER PLANTS.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Abram Perlstein

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

KAREN LOCKWOOD
1368 CREST ROAD
DEL MAR, CA 92014

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Steven Barrett

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

It is well known that insurance agencies will not insure nuclear reactor sites. Why is that?? Because the costs are astronomical. It will eventually be passed on to the taxpayers. As consumers of energy - when solar power is installed on every rooftop in California, and wind energy has been utilized, use these alternative choices first. Nuclear meltdowns destroy the planet for millennia. There is no place safe to put nuclear waste. In Japan they have dumped nuclear waste in the ocean contaminating it over a large area. We need SAFE, ALTERNATIVE ENERGY. It's time to shut down these reactors.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

It's clear from the experience in Japan that nuclear energy and nuclear reactors are not safe, and we cannot predict and prepare for every emergency situation. If something similar were to happen here in California, it would not only jeopardize local residents but impact food supplies for the entire world! Any impact on agricultural land, our rivers and coastline would disrupt food supplies in a major way!

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Dear Commissioners:

As California taxpayers, my family and I have been watching the course of events in Fukushima, Japan. Knowing that the reactors are US-designed and made, we could only surmise that the horrors visited upon the Japanese people have a good chance of happening here in California as well. This is because the Californian reactors, like those in Japan, are located near fault-lines, are vulnerable to the same kind of tidal waves, and have NEVER solved the critical issue of how to safely dispose of radioactive waste. The Japanese experience - the permanent contaminating of the soil, water and food supply with radioactive materials and the forcing tens of thousands of people to abandon their homes, jobs and businesses, perhaps forever - should never be allowed to happen in California.

We do NOT want such a disaster to happen in California - EVER. The nuclear reactors, particularly those at Diablo Canyon and San Onofre, are disasters waiting to happen.

We therefore want you to make every effort to ensure that all nuclear reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Instead of helping the obsolete and dangerous nuclear industry hang on and delay dismantling their obsolete plants, we want you to move ahead at full gallop to implement, without delays, renewable and solar energy sources and, by doing so, move our state toward a future free of dangerous nuclear reactors and their toxic and deadly radioactive byproducts.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dr. Richard & Carolyn Rosenstein

1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. All of California is an earthquake zone. There should be no nuclear power plants anywhere in California. The danger from earthquakes and tsunamis are too serious.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Jeri pollock

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sacramento, CA 95814-5512

Dear Commissioners: I was arrested in front of Diablo in 1978 because as Bio-Prof I was concerned about what they were going to do with the nuclear waste---storage on site is NOT acceptable.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

As the Energy Commission considers what California's energy future should look like, I want you to close Diablo
ASAP

At least the Energy Commission should:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sacramento, CA 95814-5512

Dear Commissioners:

When the Japanese nuclear facilities failed recently, I got a bloody nose when the Japanese radiation hit the Californian coast line. My bloody nose lasted for two weeks until I could get an appropriate iodide tablet to take. The tablets stopped my bloody nose in one hour. I have rarely had a bloody nose in my life, but I did learn that bloody noses are a sign of radioactive poisoning.

If Japan's reactors can cause this from the other side of the Pacific Ocean, then certainly I will be affected by any nuclear accident at San Onofre or Diablo because these are close to Los Angeles and especially because they are on the Andreas faultline, on which we expect a spectacular earthquake anytime soon.

We don't need nuclear reactors which are dangerous to all life. We have in Southern California a blessing of sunshine => solar power, winds in the canyons => wind power, and ocean energy => geothermal energy. These are all clean renewables, AND THEY ARE INFINITELY CHEAPER AND FASTER TO INSTALL AND MAINTAIN THAN NUCLEAR.

Please get a grip on your imaginations and don't let them float about the "value" of nuclear power. Instead please look at the facts, and realize that nuclear energy is plain dangerous. And please keep reading as there is more to say.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. - 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Barbara Bennigson

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dorothy Holland

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - these reactors are a potential disaster.

As the Energy Commission considers what California's energy future should look like, I urge you to make every effort to ensure that the reactors are closed and replaced with CLEAN, RENEWABLE ENERGY and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

Additionally there is a large amount of radio active waste simply piling up with no plans for safe handling. How can anyone justify adding to this dangerous waste without creating a safe way to handle it? I believe it is immoral and rather stupid to keep running the plants without a safe way to permanently deal with the waste.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

I live less than 3 miles (as the crow flies) from the Diablo Nuclear Power Plant. I am intimately aware that due to the geography and infra-structure of the area, it is highly unlikely that my family would be able to evacuate in case of an accident. When I speak of this, I'm speaking of an accident that doesn't affect the roads and other infrastructure; in other words, an accident that didn't involve a natural disaster. If there is an accident -such as an earthquake- involving a natural disaster, I know we would be told to 'shelter in place', an unacceptable answer to me. Further, given the natural beauty and tourist-attractiveness of our community, any accident -or even great potential for accident- has the ability to devastate our communities.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Leslie Kasanoff

Dear Commissioners:

We have seen the consequences of nuclear reactors in Japan, now suffering radioactive contamination of soil, water and food and thousands of people forced to abandon their homes.

We must not allow that to happen here in California, and our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks, also located on the coast along earthquake fault lines and near major population and agricultural areas.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. Michael Rotcher

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Ms. Ruth Sander

- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

L Parrish
27420 Schulte rd.
Carmel, CA 93923

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

For the love of humanity, shut these accidents-waiting-to-happen DOWN, please.

Sacramento, CA 95814-5512

Dear Commissioners:

In 1958 ALL mother's milk - worldwide - was contaminated with strontium 90 from nuclear bomb testing; this led to a BAN on above ground nuclear testing. What is needed RIGHT NOW is the shut-down and dismantling of nuclear power plants world-wide, and certainly in California. I was 12 years old in 1958 and lived 45 miles from the Pantex nuclear bomb factory in Texas, where the Geiger counter in my high school was OVER the maximum allowable amount of radiation every second of every year and many people in the area died from bizarre forms of cancer, including two of my grandparents. I also lived three miles from a nuclear power plant in Oregon, and am a liver cancer survivor, my liver cancer being caused in my opinion by overexposure to radiation.

We went through atomic bomb drills in grade school. These 9.0 quakes can happen all over the world. How frightening and stupid is it that the Diablo Canyon Nuclear Power Plant in San Luis Obispo County, California, is FOUR BLOCKS from an earthquake fault???

I think we should focus our energies on something we can do something about, which is dismantling our nuclear power plants. Because Los Angeles is about 150 miles from Diablo Canyon and a San Onofre meltdown would affect not only the 14 million people in the Los Angeles Basin but also more millions in Southern, Central, and Northern California – and these plants are much closer to Los Angeles than the six nuclear reactors in Japan are to Tokyo.

We can no longer afford nuclear power and nuclear waste for which there is no safe storage site on this earth. We would be fools if we ignore the damage that a 9.0 earthquake could do to not only the eighth-largest economy in the world, but to the 37 million people who live here. No scientist, no matter how knowledgeable - can say with certainty that a 9.0 quake will never happen here. There have been at least seven earthquakes approximating 9.0 since 1952, six of these on the Pacific Ring of Fire on which California is situated.

We owe it not only to ourselves but to our posterity to be a good and responsible caretaker of this earth and shut down nuclear power worldwide. NOW.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

(1) In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the

commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

2) Recommend that the original Certificates of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be revoked.

3) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 200 miles and beyond, and analyzing the associated costs until they can be dismantled.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. And as we know from the nuclear bombing of Hiroshima and Nagasaki, long-term damage and casualties from a nuclear catastrophe are a certainty which we must avert in California by closing San Onofre and Diablo Canyon Nuclear Power Plants.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines - near major population and agricultural areas - these reactors are catastrophes waiting to happen.

California's two nuclear sites - Diablo Canyon and San Onofre - are both vulnerable to earthquakes and tidal waves and they have highly radioactive waste piling up onsite. After the Tohoku Japan earthquake on March 11 of this year, the ocean waves from the resulting tsunami which hit California were choppy for two months.

Clean, renewable energy sources and efficiency technologies could easily replace the electricity provided by nuclear reactors. Yet utilities PG&E and Southern California Edison want to keep their reactors running for decades beyond their originally designed and licensed lifetimes. These licenses should not be extended – and it is the responsibility of the California Energy Commission to take the forward-looking and wise view that has propelled California to the top ranks of civilization and recommend that these plants be closed.

These plants are nuclear bombs waiting to go off, which it is within your power to prevent.

Thank you for your prompt consideration in this serious and pressing matter.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. Ron Schutte

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

ANA CORIA

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

Just as Chernobyl did 25 years ago, the Fukushima disaster demonstrated perfectly that there is no such thing as safe nuclear power.

Because of this. I am asking that you plan a nuclear free future for California. San Onofre (30 miles from my home) sits on a major fault line. The facility has a terrible safety record, and is currently leaking radioactive tritium. There is no way the San Onofre plant can be operated safely.

Please make the decommissioning of San Onofre and Diablo Canyon the centerpiece of California's energy future.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Donald Nelson

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Dear Commissioners:

The earthquake and especially the dangers from the nuclear reactors in Japan were horrifying, and we need to take steps to be sure this can't happen in California. I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, it is important to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Darlene Lovell

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

Comments from various uninformed groups and individuals about our two nuclear plants being "risky" or dangerous under earthquakes and "tidal waves" are not based in fact.

As the final report to you by your consultants clearly indicates, both Calif. plants have excellent operational records, both appear to have safety margins to earthquakes that exceed even present, new estimates.

www.energy.ca.gov/2008publications/CEC-100-2008-005/CEC-100-2008-005-F.PDF

It's certainly true that further analyses of both sites' vulnerabilities is called for, especially with regard to San Onofre and fuel storage, but it's also clear that risks for failure are more likely in non-nuclear portions of these plants, just as in any conventional power plant.

I urge you, as an environmentalist and engineer, to stay with facts and not be swayed by uniformed bias. It's especially important to recognize the irrelevance of the Fukushima management & regulation tragedy to our reactors.

Sincerely,

--

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs.
