DOCKET

11-IEP-1J

DATE _____

RECD. AUG 02 2011

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mark Clayton

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

San Dimas, CA 91773-2456

California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. They have the best technology in the world--and it isn't good enough. Radioactive waste keeps piling up; dozens of reactor needs retro fits they aren't getting; earthquakes are increasing in intensity.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen. New York and Los Angeles and San Diego are all threatened by these needless plants.

As the Energy Commission's leaders consider--hopefully the defective science--and just what California's energy future should look like, I want you to make every effort to ensure that these reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following eminently sensible recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants, if they were rendered unusable by an earthquake or other disaster.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.

2) Recommend that the commission's leaders get reputable scientists on board to study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act. It is not merely out of date, it's ridiculously and shockingly low.

3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, also the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste, for which at present there is no solution at all.

4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission's experts have already recommended that residents near the Fukushima reactors voluntarily evacuate a similarly-sized area.

Thank you for considering these comments and for moving our state scientifically, toward a future free of dangerous and wholly unnecessary nuclear reactors. New York, San Diego and Los Angeles are the places I have lived for most of my life.. They mean a great deal to me; and I see no sane reason for them to be under the shadow of needless nuclear disaster any longer. I still live in San Diego. I'd rather like to be able to go on doing so.

Thanks again for consulting scientists, not political brains on this vital issue for California's and the nation's energy future. Whatever we did is past; it's time to move on to clean and renewable energy. Long past the time...

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. Dear Commissioners:

My wife is from Japan. We have friends in the effected areas around Fukushima. They have been devastated. They litterally have no hope of things getting back together in their lifetimes. My friend's wife was told not to breastfeed because her milk might be contaminated.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. I was happy that the local nuclear reactor in Humboldt County has been mothballed for a number of years after the discovery that it was built on an earthquake fault. But I have concerns about southern California.

I worry that the decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies. In my recent visit to Los Angeles, I noticed numerous rooftops and parking lots completely devoid of photovoltaics. There's a place to start!

I agree with Friends of the Earth that the Energy Commission should make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission

recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

My name is Yuki Spencer, I am from Japan. I have friends in the effected areas around Fukushima. They have been devastated. They litterally have no hope of things getting back together in their lifetimes. My friend was told not to breastfeed because her milk might be contaminated.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

5) To these points I add a fifth. It seems that common sense is lacking in public policy, not only in California but also throughout the nation and the globe. It should be obvious that after the Fukushima disaster, all--and I mean all--nuclear plants should be shut down and dismantled. Why is the obvious so elusive to those who make and implement policy, and not only in the nuclear issue?

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. Andrew Osborne-Smith

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

I have been anti nuclear for decades now because of the adverse affects that can be caused by nuclear power and of course nuclear warfare. Now that we have seen the fall out from the reactors in Japan the jig is up and it is clear that this type of power is unsafe when there is an event like the earthquake that occurred in Japan. As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Karen Cappa

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - these reactors are disasters waiting to happen. (It would be comedic if the situation weren't so precarious and stupid.)

As the Energy Commission considers what California's energy future should look like, I demand you make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

I have a Ph. D. in Physical Organic Chemistry from Harvard University. I'm 89 years old and have seen the ewhile thing unravel. In the beginning, with little thought it did seem like "free" energy, no costs.

But nuclear waste, any nuclear waste is too much. Every reactor should be stopped, the area cleaned up and NO MORE WASTE should be produced. We could be killing our grandchildren's future through hundreds of generations. Dr. Charles E. Dills

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

Living within 20 miles of Diablo Canyon makes me feel like a fool. Fukushima makes me feel like a stupid fool. Yes, there are good reasons to be here in San Luis Obispo County, that my ancestors understood when they arrived three generations ago.

In fact, reasons too good to turn this wonderful place into a disaster site. I might withstand an earthquake, and my home is not threatened by tsunamis, but no one will withstand those horrors combined with their effects on Diablo.

Shut this plant down. Nothing is worth the devastation that Diablo will bring upon us, if not now then later...how much later? Tomorrow? Next year? As a society, we own the responsibility. Shut it down.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Ms. Myrna Carr

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. California Energy Commission
Dockets Office, MS-4
1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Rochelle Becker

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

Because the citizens of America have been kept from the problems that have continuously been occurring over the years, the dangers of mismanagement and lack of real evolving inspections with improvements are the real dangers. Plus, these over 40 years old reactors and their voluminous amounts of old fuel rods, are a forever problem that come at huge expense to store away from dangers for hundreds of years to come. California and their quakes will not stop, and we all know the 'big' one is coming. When it does, there is nothing prepared to protect the public. We'll be the next Japan and destined to exposures that will kill us sooner.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic

vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I urge you to authorize the construction of 4th generation nuclear power plants.

They will recycle the spent fuel and produce negligible waste.

While solar, geothermal, wind and other technologies appear to be the solution they are not cost effective and are unable to provide the power we need.

Thank you for considering these comments and for moving our state toward a future of low cost, safe energy from 4th generation nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

I went to college in California in the 1980s, lived here in the late 90s, and live here again. So I have seen a fair amount of the history of energy in the state.

After years of debate, the horror of Fukushima seems to have lent greater weight to the arguments against the nukes at Diablo Canyon. I've always thought they were a bad idea.

I agree with Friends of the Earth and ask you to do the following:

Recommend as part of your Integrated Energy Policy Report (IEPR) for 2011:

- 1) That the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) That the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Increase the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Dear Commissioners:

As a California ratepayer and resident, I have opposed the concept of nuclear energy from the beginning. I am horrified that my initial fears have more than been confirmed.

I believe that the old nuclear plants are highly dangerous and the idea of building new ones is a toxic miscalculation and puts at risk future generations and the planet itself.

The old reactors must be closed and replaced with clean, renewable energy. Additional plants must NOT be considered.

In agreement with Friends of the Earth, I

1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.

2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Please make out state an example of responsible governing and move our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

No nukes. What are you trying to do, kill us all? There is no room on this planet for nuclear energy. Shut down San Onofre and Diablo and clean up Humboldt Bay and Livermore Labs, ASAP. And double check, triple check PG&E's nuclear records before you start finding week seams in reactors too.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around

California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Patricia Lawrence
PO Box 800

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes. A man-made catastrophe, and these two facilities are acidrnts waiting to happen, should not be a major ingredient in my retirement years, nor in anyone elses future; and, we are sitting on a powder keg.

I do NOT want that to happen here in California, and I am deeply concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose critical similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas -- these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Pat Reese

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.

Dear Commissioners:

California, reputed "Athens of the West", needs to promote an INTERNATIONAL SLOW ENERGY MOVEMENT!

The world attempting to solve "URGENT" energy needs with NUCLEAR generation is too much like a person solving a diarrhea/urgent need to defecate during the night ---- by shitting in bed.

WITH BOTH, YOU END UP WITH A HORRIBLE MESS TO CLEAN UP....

only NO ONE WILL BE LEFT/around long enough to clean up 25,000+ years of a radiated planet!

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Dear Commissioners:

I would like to urge you to consider Germany's example and draft a strategy to replace California's nuclear reactors by renewable energy sources. With the right policies this could be done by 2020, using distributed energy sources.

1516 Ninth Street
Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I was profoundly disturbed nuclear reactor disaster in Japan as they melted down. They contaminating soil, water and food with radioactive materials and forced tens of thousands of people to abandon their homes. Even at that the Japanese government continues to conceal the true scope of the problems.

I do NOT want a repeat of this catastrophe in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks, and both have spotty safety records. They are also perched directly on the coast along earthquake fault lines cheek by jowl with major population and agricultural areas, so we have multiple disasters waiting to happen.

While Energy Commission weighs California's energy future it's essential to make every effort to ensure close and replace these reactors with clean, renewable energy and energy efficiency technologies.

The Energy Commission needs to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly

sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors. I live near one of these reactors and I am most familiar with the safety problems at San Onofre.

Sacramento, CA 95814-5512

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

RACHEL CLARKE-ROBERTS

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

The question is are we Californians smart enough to learn from our Japanese friends tragedy or are we ignorant fools who will run these reactors until we contaminate our corner of Earth? Let's follow the Germans and realize a future with no nukes. I have used solar power on my roof for over 8 years. We don't need Nukes, and I want to think you public servants know this.

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Mr. Gabriel Sheets

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

We have safe energy technology at our disposal - solar, windmill, etc. It is the height of folly to have nuclear energy plants on a earthquake site. Can we not learn from Japan?

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.

Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:

- 1) Recommend that the appropriate government agencies and utilities undertake immediate studies to determine how they would replace the 4400 MW of baseload electricity produced by the nuclear plants if they were rendered unusable by an earthquake or other disaster. Studies should also determine how this baseload generation will be replaced by energy efficiency and new renewable energy sources by 2025, when the originally designed and licensed lifetime of last of the reactors will expire.
- 2) Recommend that the commission study how California residents, property owners and businesses would be "made whole again" if a Fukushima-level disaster struck the state. In light of damage estimates from Japan's nuclear disaster that exceed \$230 billion, the commission should also recommend that the federal government reassess the \$12 billion cap on utility companies' financial liability for nuclear accidents set by the Price-Anderson Act.
- 3) Recommend that the original Certificate of Public Convenience and Necessity issued for Diablo Canyon and San Onofre be reviewed to consider new information on seismic vulnerabilities, the increases in population near the reactors, and the continuing lack of a permanent offsite solution to safely store highly radioactive waste.
- 4) Recommend increasing the emergency planning and evacuation zones around California's reactors from 20 to 50 miles and beyond, and analyzing the associated costs. In the wake of the nuclear emergency in Japan, the U.S. Nuclear Regulatory Commission recommended that residents near the Fukushima reactors voluntarily evacuate a similarly sized area.

Thank you for considering these comments and for moving our state toward a future free of dangerous nuclear reactors.

Dear Commissioners:

As a California ratepayer and resident, I watched with horror as nuclear reactors in Japan melted down, contaminating soil, water and food with radioactive materials and forcing tens of thousands of people to abandon their homes.

I do NOT want that to happen here in California, and I am concerned that our decades-old nuclear reactors at Diablo Canyon and San Onofre pose similar risks. Sitting directly on the coast along earthquake fault lines -- and near major population and agricultural areas - - these reactors are disasters waiting to happen.

As the Energy Commission considers what California's energy future should look like, I want you to make every effort to ensure that the reactors are closed and replaced with clean, renewable energy and energy efficiency technologies.

Specifically, I would like the Energy Commission to make the following recommendations as part of its Integrated Energy Policy Report (IEPR) for 2011:
