Combined Heat and Power Long-Term Planning

Lead Commissioner Workshop on Combined Heat and Power in California

2012 Integrated Energy Policy Report Proceeding

February 16, 2012

David Vidaver

Electricity Analysis Office

California Energy Commission www.energy.ca.gov

Targets for New CHP

- 6,500 MW by 2030 (Clean Energy Jobs Plan)
- 4,000 MW/6.7 MMT CO₂ by 2020 (ARB/AB32 Scoping Plan

Planning Assumptions

2020 LTPP assumed 50 percent of ARB target, applied to ISO control area, 50/50 split between onsite use and export. By 2020,

- 810 MW in NP26
- 667 MW in SP26
- 86 MW in San Diego
 1,563 MW

2011 IEPR filings, integrated resource plans do not indicate that POUs are planning on (incremental) CHP to meet future energy or capacity needs

Eight Years Isn't a Long Time

While current reserve margins are high

- 12,000 MW of OTC capacity is likely to be retired by 2020; this capacity provides a significant share of the flexibility expected to be needed to integrate 33 percent renewables
- Targets established for other preferred resources (energy efficiency, demand response programs) are ambitious
- Potential (local) capacity shortfalls are most likely in load centers in which CHP potential is substantial (e.g. Los Angeles basin)

Existing Programs

- AB 1613
 - Small projects (≤ 20 MW)
- Self-Generation Incentive Program (SGIP)
 - Small projects
 - Dominated by renewables, fuel cells
 - Ends at the end of 2015

QF Settlement and Targets

- 3,000 MW of new CHP contracts but resigning existing CHP counts towards this target
- 4.3 MMT of CO₂ reductions, but
 - least-cost, best-fit may justify failing to reach target
 - Incremental contributions of CHP to meeting target (mt/MW) may be small

Questions

- How much new CHP is likely to be procured as a result of the Settlement?
- What types of CHP resources are likely to be most competitive in RFOs? To meet leastcost, best fit criteria to be used by the IOUs?
- What value or range of values might be appropriate for long-term (through 2022) planning assumptions for new CHP (onsite use and export on peak)?
