Reported By: Peter Petty

APPEARANCES

Commissioners Present

Robert Weisenmiller, Chair

Andrew McAllister

Janea Scott

CEC Staff:

Bill Pennington, Senior Technical and Program Advisor to
the Energy Efficiency Division

Heather Raitt

Michael Sokol

Alana Mathews

Pam Doughman

Joint Agency Participants:

California Public Utilities Commission (CPUC):

Carla Peterman

Cliff Rechtschaffen

Martha Guzman Aceves

California Air Resources Board (CARB, ARB)

Richard Corey

Sam Gregor

Governor's Office

Alice Reynolds

APPEARANCES (Cont.)

Presenters

John Chen, Los Angeles Department of Water and Power

Panelists:

Maria Stamas, Natural Resources Defense Council

Vanessa Guerra, Mutual Housing California

Sophia Hartkopf, TRC Solutions

Nick Dirr, Association for Energy Affordability

Betsy McGovern-Garcia, Self Help Enterprises

Jason Wibley, California Department of Community Services
and Development

Randall Winston, Strategic Growth Council

Sekita Grant, Greenlining Institute

Andrew Dugowson, Southern California Edison

Matt Perry, Energy Upgrade California

Sarah White, California Workforce Development Board

Carol Zabin, UC Berkeley Labor Center

John Brauer, California Labor Federation

Ross Nakasone, BlueGreen Alliance

Melvin Parham, Rising Sun Energy Center

Deana Carrillo, California Alternative Energy and
Advanced Transportation Financing Authority

Al Gaspari, Pacific Gas & Electric

Justin Wynne, California Municipal Utilities Association

APPEARANCES (Cont.)

Stephanie Wang, California Housing Partnership Corporation

Tammy Agard, EEtility

Erica McConnell, Interstate Renewable Energy Council

P R O C E E D I N G S

May 16, 2017

9:31 a.m.

MS. RAITT: Good morning and welcome to today's IEPR Joint Agency Workshop on Senate Bill 350, the Low Income Barrier Study Implementation. I'm Heather Raitt, I'm the IEPR project manager. I'll go over our usual housekeeping items. If there's an emergency, please follow staff to evacuate the building to Roosevelt Park across the street from us.

Our workshop today is being broadcast through our WebEx conferencing system so parties should be aware you're being recorded. There will be an audio recording posted on our website in about a week and a written transcript in about a month.

We do have a very full agenda, so I'd like to remind our speakers to stay within your allotted time. At the end of the day we will have a public comment period where folks can present comments and we are limiting them to three minutes each. If you'd like to go ahead and fill out a blue card and you can give it to me to let us know you want to make comments.

And for the folks on -- sorry. For folks on WebEx, hi. For folks WebEx, if you want to make comments at the end of the day, please go ahead and raise your hand, tell our WebEx coordinator that you'd like to make

1 comments. And we only do comments at the end of the day.

2 Materials for this workshop are available on our
3 website and at the entrance of the hearing room. Written
4 comments are welcome and they're due on May 30. And the
5 notice provides information on how to submit written
6 comments.

7 And with that, I'll turn it over to the Chair for
8 opening remarks.

9 MR. WEISENMILLER: Good morning. I'd like to
10 first thank all of my colleagues on the dais for being here
11 today and also thank all of you for participating.
12 Obviously, one of the things that are very important to all
13 of us in this administration is to make sure that all
14 Californians can participate and benefit in our clean
15 technology programs. Energy Commission got the charge
16 under SP 350 to do a report on the barriers to such
17 participation and we adopted that report. It's going into
18 this year, we're now focusing on implementing the
19 recommendations. Commissioner Scott on my right is sort of
20 leading up the implementation effort along with Michael
21 Sokol.

22 Let me get some brief comments on the --
23 encourage everyone on the dais to give some brief comments
24 so we can move forward.

25 We'll first start with Alice Reynolds from the

1 governor's office.

2 MS. MILLS: Thank you very much. And I'll start
3 by saying that I am really pleased to be here and also
4 wanted to thank CEC staff for organizing this workshop.
5 And communicate the strong support of the governor's office
6 for the process that we're involved in here.

7 This is a very important issue that we're all
8 grappling with and everybody knows that we can't transform
9 to a low-carbon economy if we're not including all
10 Californians in that transformation.

11 And just the concept of looking at barriers shows
12 that we don't have a smooth road to travel. We know there
13 are barriers that exist. And so we -- realizing that
14 challenge, we have, you know, in addition to this workshop,
15 we've started to get a number of agencies together. We've
16 formed a taskforce to make sure that implementation
17 proceeds in a way where all agencies are coordinating, and
18 we kicked off that taskforce last week. And just to let
19 everyone know, we are not as far as agency participation,
20 we're not starting from scratch. We have members of the
21 taskforce who are very well informed about the issues that
22 we're looking at. We are not starting from, okay, you
23 know, that this is the baseline, we're starting from a very
24 high level of engagement and motivation. We have committed
25 members of the taskforce. So we feel like we're very well

1 positioned to start this process.

2 I look forward to this workshop today and
3 encourage participation and I think that the agenda has a
4 lot of very substantive presentations. So I'm pleased to
5 be here. Thanks a lot.

6 MR. WEISENMILLER: Thank you. Richard. Do you
7 want to say?

8 MR. COREY: Yes. Thanks, Chair Weisenmiller.
9 And I equally am really pleased to be here because SP 350
10 calls out a number of really important elements, but Alice
11 just talked about a key one and that is recognizing that
12 clean energy and clean transportation, there are some
13 barriers for lower income disadvantaged communities to
14 fully take advantage.

15 And in recognizing that, the director's direction
16 to the energy agency CEC, ARB was really to focus on public
17 process to clearly articulate and identify those barriers.
18 But clearly that's part of it, the key part is what do you
19 do about it? I think that's part of this discussion and
20 how we're going to move forward and what we're really
21 looking forward to.

22 From ARB's perspective, clearly moving forward on
23 clean transportation will require a tighter link, a tighter
24 link between the energy sector because that clean
25 transportation is electric transportation. We're clearly

1 on that path for on the light-duty side cars and trucks.
2 We're progressively moving that way for heavy duty. So
3 looking through options, opportunities to really take
4 better advantage to ensure those technologies. When I say
5 those technologies on the transportation side, that's zero
6 emission vehicles, near zero emission vehicles, it's
7 ridesharing, it's walkable communities, bicycles. A full
8 range in terms of how we plan communities, how we execute,
9 how we manage, execute, incentive programs.

10 So there's a great opportunity if we do this
11 correctly. And I look forward to the exchange that takes
12 place today and the process going forward. So thank you.

13 MS. SCOTT: Good morning, everyone. I would just
14 like to echo the remarks that you've heard from Alice and
15 from Richard and from Chair Weisenmiller this morning. As
16 you all know, it can't be overstated the importance of
17 making sure that low-income communities and disadvantaged
18 communities are a part of the clean energy revolution that
19 is taking place in the state even as we speak.

20 And so putting together the study as directed by
21 the legislature under SP 350, the Energy Commission's
22 portion was focused on renewable energy and on energy
23 efficiency. We came up with 12 recommendations and some of
24 those recommendations we will be discussing in great detail
25 today. So I'm very much looking forward to the panels.

1 And what we're really looking to do is figure out how we
2 put in place some solutions to start really addressing
3 these barriers and solving them.

4 As Richard mentioned in his remarks, many of
5 these recommendations are crosscutting and they reach
6 beyond just the Energy Commission and that is why we have
7 been working in partnership this whole time. This isn't
8 something that just started this morning at our workshop
9 but we've been working with the governor's office, we've
10 been working closely with ARB on the transportation
11 barriers. We've been working closely with our colleagues
12 at the PUC. And this is a continuation of that great work
13 together.

14 So I want to thank all of you for joining us on
15 the dais as well. And I'm really looking forward to the
16 panels today, so I will end my remarks here.

17 MS. PETERMAN: Good morning, everyone. I'm
18 Commissioner Carla Peterman with the Public Utilities
19 Commission. Thank you to the Energy Commission, Chair
20 Weisenmiller, Commissioner Scott for hosting this very
21 important forum.

22 In addition to what's been stated already that
23 we'll have an opportunity here via the report and the
24 discussion to think about new solutions and programs, I
25 want to acknowledge that we have several existing programs

1 that are focused on how do we provide better access to
2 disadvantaged communities, low-income communities to our
3 programs. So what I'm really looking forward today is also
4 getting some insight into how do we get better utilization
5 of the existing programs, what are the barriers to
6 accessing those programs, and also how do we coordinate our
7 programs more. For example, the two areas in which I'm
8 particularly working on this issue relate to energy
9 efficiency and electric vehicles, and we're constantly
10 trying to think about how to target those who are in
11 apartment buildings and multifamily dwellings. And so how
12 do we do that outreach but not inundate folks with the same
13 message or multiple messages about different programs. And
14 so figuring out how we can best coordinate activities will
15 be very useful.

16 An additional note, we've recently re-launched
17 the energy upgrade California marketing and consumer
18 engagement campaign which is focused on being a one-stop
19 shop for information about access energy efficiency and
20 clean energy programs and how can we better utilize that
21 platform to reach the members of the community who may be
22 in most need of these services.

23 So thank you. And I want to acknowledge we have
24 CPUC staff here and thank you for the work they've done in
25 coordinating with the Energy Commission on these efforts.

1 MR. RECHTSCHAFFEN: I'm Cliff Rechtschaffen, and
2 also a commissioner at the PUC and I'm the lead
3 commissioner work for the PUC on this barriers workshop and
4 program. Although Commissioner Peterman and other
5 commissioners are also working closely on related sets of
6 issues.

7 As Commissioner Peterman said, there's a lot
8 going on in this area SP 350 and other statutes and other
9 recent developments has forced us to focus on how we best
10 integrate environmental justice throughout the programs we
11 run at the PUC, procurement, workforce development
12 incentives, enforcement, and so forth. And there's a lot
13 going on, some of which will be covered here, other things
14 that are going on that won't be explicitly covered here.

15 The big picture is very important to keep in
16 mind. Poor people spend a disproportionate amount of their
17 income on energy in California. Some cases twice as much
18 as middle income or affluent people. That's just going to
19 get worse with climate change. Poor people live
20 disproportionately in housing that's poorly insulated,
21 leaky, has -- that have inefficient appliances. They also
22 tend to live disproportionately in communities suffering
23 environmental burdens. And to date, they have not shared
24 equally in the benefits of our clean energy and clean
25 transportation programs.

1 You've heard and you'll hear today the extensive
2 work of the Barriers Report. It did really an excellent
3 job. I can praise it because -- it was a joint agency
4 report but the CEC took the laboring on, they did a really
5 outstanding job at identifying the barriers and coming up
6 with recommendations. So we look forward to rolling up our
7 sleeves and starting to implement the recommendations of
8 the report.

9 MS. RAITT: Great. So we have two presentations
10 to give an overview of the Barrier Study.

11 First is Michael Sokol at the Energy Commission.

12 MR. SOKOL: All right. Good morning, everyone,
13 and thank you for coming out today. It's really exciting
14 to see, you know, good participate up on the dais and out
15 here in the audience. And a lot of interest and excitement
16 on this topic and the steps that will be taken over the
17 coming months and years to keep this conversation moving
18 forward. So.

19 I'm Michael Sokol with the Energy Commission.
20 I'm a coordinator for SP 350 implementation which includes
21 the low-income Barrier Study. But really SP 350, I'm sure
22 everyone's well familiar, but there's some major goals in
23 there such as the 50 percent renewable energy by 2030
24 mandate requiring a doubling of energy efficiency savings
25 by 2030 looking at encouraging widespread transportation

1 electrification. And all that is under -- underlined by a
2 shift towards integrated resource planning to reduce
3 greenhouse gas emissions across the electricity sector.

4 But really a theme throughout SP 350 and the
5 reason why we're here today is that there's a strong
6 priority place for low-income customers and disadvantaged
7 communities to participate in the benefits that clean
8 energy and clean transportation provides.

9 So really the, again, the requirement from SP 350
10 for what we call the Barrier Study is to identify the
11 barriers faced by low-income customers including those in
12 disadvantaged communities in accessing photovoltaics and
13 other sources of renewable energy and energy efficiency and
14 weatherization investments. Also SP 350 require the Energy
15 Commission to evaluate the barriers faced by local small
16 businesses in contracting, local small businesses in
17 disadvantaged communities. And lastly, you'll hear more
18 about this in just moment, but ARB also completed a study
19 on the low-income, the barriers faced by low-income
20 customers in clean transportation options.

21 And so SP 350 kind of gave us the playbook, but
22 in October 2015, that was signed. And so the Energy
23 Commission, ARB spent the majority of last year really
24 working through the scoping process of these studies. And
25 so the Energy Commission, we completed an extensive

1 literature review of over a hundred-plus articles. We
2 engaged a lot at the local level with a number of meetings
3 across the state including with ARB participation and with
4 a lot of community-based organizations and locals. So at
5 least seven of those meetings were held across the state.
6 We also had a couple of technical workshops up here in
7 Sacramento to really have some good panel discussion and
8 set the foundation for providing input into the report.

9 And, again, there was extensive outreach in a
10 variety of formats including fact sheets in a number of
11 languages, social media campaign, and we all brought all of
12 that together for the final report which was adopted here
13 at an Energy Commission business meeting last December. So
14 it's available online for everyone that hasn't seen it yet.
15 Hopefully you'll get a chance to dig in to it and then
16 we'll talk a little more about what steps has been taken
17 since then.

18 As everyone mentioned up on the dais, really even
19 though we've finalized and published this study, this is
20 really the first step and it's starting the conversation
21 for how we carry things forward, how we look at the
22 recommendations that I'll describe in just a moment here,
23 and then figuring out how do we really make a difference
24 for enabling access for low-income customers to clean
25 energy.

1 So just quickly I'll overview the barrier
2 categories that were identified in the Energy Commission's
3 study. There were a number of individual barriers
4 identified. Oftentimes there's sort of crosscutting but
5 what we did is categorize them into three major categories
6 starting with structural barriers or those that are
7 inherent to the conditions of poverty. Those are difficult
8 to address through some of our programs alone but there can
9 be differences made.

10 The second category is looking at policy and
11 program barriers. And that's really identifying
12 opportunities for improvement of market delivery and making
13 sure that programs are aligned in a way that's going to
14 amplify benefits for low-income customers.

15 And then the third category are barriers that are
16 specific to local small business contracting in
17 disadvantaged communities.

18 So just at a high-level, hitting on the
19 structural barriers, a majority of low-income Californians
20 are renters, so there's a little homeownership rates and
21 specifically when you get into multifamily buildings, there
22 are some issues that are difficult to address such as split
23 incentive issues, complex kind of financing needs, and
24 obviously lack of ownership complicates matters. Even if a
25 low-income customer does own their home, there's oftentimes

1 insufficient access to capital or, you know, lower credit
2 scores can be an issue. And so making sure that there's
3 financing options that don't require customers to take on
4 significant new debt and really inspire additional
5 investments to be made are needed.

6 The building age can often be an issue when it
7 comes to upgrades such as installing rooftop PV or even
8 energy efficiency upgrades. And then there are some unique
9 barriers faced by remote or underserved communities who are
10 oftentimes, you know, have high heating and electricity
11 costs are kind of very far out. And given the population
12 density is not as high, we want to make sure that they're
13 still included in the discussion as we move forward.

14 So on the second barrier category looking at
15 really program and policy barriers, market delivery can be
16 an issue, if there's lack of consistency in coordination
17 across the programs here looking at eligibility criteria
18 and making sure that it's clear who's eligible for what and
19 how to navigate that process. Really, looking at data
20 limitations which one of our recommendations touches upon
21 but making sure that there's consistent data shared across
22 programs and that it's -- you can compare apples to apples
23 to the degree possible and make sure that everyone's sort
24 of talking about the same thing.

25 Then of course unrecognized non-energy benefits

1 that, you know, oftentimes are not fully considered in sort
2 of the cost effectiveness test and so thinking about ways
3 to make sure that health and safety particularly are
4 incorporated into clean energy and transportation programs.

5 And lastly is the small business barrier
6 category. Really this is looking at lack of access of
7 information, about funding opportunities, about partnership
8 opportunities. Technical assistance and workforce
9 development was highlighted as a clear need that some of
10 these local small businesses could benefit from technical
11 assistance of navigating say grant funding or solicitation
12 processes or understanding how to reach out to the
13 appropriate folks and form the right kind of team that's
14 going to lead to success for a contract.

15 Lack of access to the financial resources that
16 are often needed to, you know, submit those applications,
17 submit those bids. Make sure that there's continuity to
18 the business to keep the business flourishing. And then
19 lack of access to support in terms of, again, kind of
20 getting back to some of that technical assistance,
21 understanding what the opportunities are within any local
22 given area and really making sure that there's
23 participation is a possibility.

24 So out of this whole study, there were 12
25 recommendations that were formulated and we categorized

1 into five principal recommendations which are sort of the
2 top five on the list that you see here, and then there are
3 seven additional recommendations. As Commissioners
4 mentioned, these recommendations are oftentimes
5 crosscutting so they touch upon multiple barriers and
6 barrier categories. And what you see here is actually just
7 a summary level. If you look at the report itself, there's
8 a lot more detail including a number of sub-recommendations
9 and specific actions that should be taken.

10 So what you see underlined here, these are
11 actually the recommendations that we'll be touching upon in
12 some detail today and so you can see that four of the top
13 five are at least on the agenda today. But I'll just run
14 through them quickly and then we'll get into more of
15 discussion which is really about -- so we have the
16 recommendations, how do we move that forward and make sure
17 that there's really action being taken and that the details
18 are really aligned across the agencies in a way that's
19 going to be most beneficial for these low-income customers.

20 So starting with Recommendation Number 1, which
21 was to establish a coordinating taskforce across the
22 agencies. As Alice Reynolds mentioned just a moment ago,
23 that conversation has been started and we have some -- a
24 lot of energy and some key players that are dialed in to
25 that and so we'll look at that as sort of the vehicle for

1 moving the conversation forward.

2 Second was looking at community solar options for
3 low-income customers and making sure that the economic
4 benefits of owning a portion of a solar system are able to
5 be realized by those customers.

6 Looking at a strategy for a green workforce and
7 education goals across agencies for clean energy and clean
8 transportation.

9 Fourth is looking at continuing to develop a
10 series of energy upgrade financing pilots to again unlock
11 those opportunities that don't require customers to take on
12 significant new debt.

13 And the fifth of the principal recommendations
14 was collaboration across agencies to make sure there's
15 common metrics and indicators that are going to be used and
16 that there's better data sharing across programs. And
17 you'll hear a lot more detail about each of these
18 recommendations a little bit later today.

19 And then just real quickly, these are the seven
20 additional recommendations. Looking really at expanding
21 opportunities for renewable energy across existing programs
22 for low-income customers. Looking at aligning tax credits
23 and credit enhancements to support clean energy upgrades
24 particularly during building rehab events. Establishing a
25 pilot program for regional one-stop shops to basically cut

1 across the silos to include things like energy, water, or
2 other resources for low-income customers. Of course making
3 sure that there's heightened consumer protection and that
4 there's eliminating any cases of fraud and building trust
5 at the local level to make sure that the benefits really
6 can be realized and that the conversation is not something
7 that's immediately causes people to shut down and not be
8 receptive to the opportunities that are out there. Looking
9 at better collaboration with local community-based
10 organizations to make sure that -- that opportunities are
11 delivered in language and in a relevant format from people
12 that know the local area and that are connected with
13 locals.

14 The Recommendation Number 11 is looking at
15 research development demonstration to enable targeted
16 benefits for low-income customers and disadvantaged
17 communities.

18 And lastly was recommending a full in-depth study
19 that looks at contracting opportunities for those local
20 small businesses in disadvantaged communities. Really a
21 data driven exercise that involves, you know, a lot of the
22 other agencies. We've laid out a lot of some of the
23 initial details in the Barrier Study but really think that
24 that's going to require a bigger effort across all these
25 agencies.

1 So just to wrap things up, as I mentioned, the
2 joint agency taskforce, we had a kickoff meeting last
3 Tuesday, May 9th. And Alice Reynolds has been facilitating
4 that and keeping the conversation moving forward. But,
5 again, there was great participation, great turnout, and
6 we'll, you know, see what the next steps are that come out
7 of that. Again, includes a number of agencies that were
8 identified in the Barrier Study, not only ours but in ARB's
9 that are impacted by the recommendations that came out.

10 And really there's some key objections of making
11 sure that we're moving forward that conversation on how to
12 implement the recommendations, that there's coordination
13 across the programs in terms of opportunities for
14 leveraging funding, aligning eligibility criteria, and
15 encouraging standardization to the degree possible. And
16 then really looking at how to prioritize key topics because
17 obviously there's 12 recommendations from our study, there
18 are a number of recommendations from the ARB's study, and
19 then there's a number of even subactions. So making sure
20 that we're able to prioritize our efforts and hit the most
21 beneficial and most need term needs first before we
22 continue to move down the conversation.

23 So just as next steps, you know, the Energy
24 Commission will plan to participate in these future
25 taskforce meetings. We're looking at a second

1 implementation workshop. Obviously as I discussed, there's
2 12 recommendations in our study, a number from ARB, there's
3 only four panel discussions today and then a presentation
4 and so there's a lot more ground to cover and so we'll look
5 to that August 1st workshop to fill in some of the gaps from
6 today's discussion. Looking at opportunities for
7 additional regional and community outreach to return to
8 some of the communities that provided that input on during
9 the scoping of the study.

10 And then looking at ways to track progress on the
11 goals of SP 350 and particularly for this one looking at
12 tracking progress for implementation of the report's
13 recommendations and enabling those benefits that we're
14 targeting for low-income customers.

15 So that's the end of my presentation and, you
16 know, we'll be happy to take any questions at the end of
17 the day today. Of course written comments will be open for
18 a couple of weeks here. And then I'll go ahead and turn it
19 over to Sam Gregor at ARB to provide the next presentation.

20 MR. GREGOR: Great. Thank you. Good morning,
21 everyone. My name is Sam Gregor, I'm with the California
22 Air Resources Board. I am the manager over the section
23 that took on the efforts to develop the study to understand
24 better the barriers that low-income folks have accessing
25 clean transportation and other mobility actions in

1 developing this document.

2 I'll reiterate what Michael said, it's been a lot
3 of work over the last year, year and a half and I'm excited
4 to see all of the participation, all of the positive
5 feedback we've received from the communities, just getting
6 out there and listening to them and understanding what
7 they're actually going through to having these barriers and
8 to understanding what we could do at the state level to
9 develop policies to increase access has been very
10 satisfying and very -- and I look forward to what we're
11 going to be doing over the next few years.

12 I think Michael touched pretty well on what the
13 overarching goals of SP 350 are so skip that slide.

14 Just to give you an idea of what SP 350 requires,
15 it's ARB identify the barrier's low-income residents
16 including those in disadvantaged communities. Face to
17 accessing clean transportation options and provide how --
18 the recommendations on how to increase them.

19 This requirement resulted from the need to better
20 understand barriers and opportunities across the state and
21 support the broader goals of ensuring this access be far
22 reaching to California's most impacted communities. The
23 results of these efforts for ARB has been laid out and what
24 we're calling a draft guidance document. And we released
25 that for the draft for public review last month.

1 So in order to better understand the barriers and
2 opportunities clean transportation access, we directly
3 engaged with local communities and low-income residents.
4 We selected a few case study communities that were
5 represented of different regions and also developed a
6 supplemental literature review which are included in the
7 draft guidance document appendices.

8 We've reviewed access to, awareness of an overall
9 affordability of clean transportation and mobility options.
10 In addition, barriers and opportunities were reviewed
11 across the spectrum of clean transportation and mobility
12 options which includes not just light-duty vehicles, but
13 access to clean transit, clean school buses. And then
14 shifting away from vehicle ownership, we looked at
15 ridesharing and car sharing opportunities with zero
16 emission vehicles. And it was also important that we
17 looked at active transportation. So how do we get safe
18 infrastructure for walking and biking. So we looked at all
19 of -- all of the mobility options that people utilize
20 especially lower income folks who aren't always able to
21 afford their own vehicle. There's a lot of different ways
22 for them to get access to clean and zero emission
23 transportation.

24 So next I'll provide an overview of the draft
25 guidance document. Similar to CEC's barriers report, we

1 see this as the initial step in an ongoing process which
2 identifies barriers and more importantly provides an
3 initial pathway to overcome them. The document is intended
4 to span a broad spectrum of methods to increase the access
5 to clean transportation, given each community has its own
6 unique needs and that's one thing we were -- we really --
7 we're told up front that we need to look at different
8 communities to understand that one solution doesn't fit
9 all.

10 So the recommendations build-upon efforts already
11 occurring to increase access to clean transportation, this
12 document provides and encourages continued evaluation of
13 the best practices to increase access and provides a
14 foundation for future policies and investment decisions.

15 Next I'll describe briefly the key barriers that
16 we found of when interact -- when talking with low-income
17 folks. First off, you know, it's not new overall
18 affordability of clean vehicles and clean transportation
19 and mobility options. As was mentioned earlier, they don't
20 have the income to be able to purchase zero emission
21 vehicles or to access some of the services that more
22 affluent people are able to do.

23 The second, sustainable long-term funding for
24 clean transportation programs and energy programs. Current
25 funding sources are not sufficient to meet the needs for

1 expanding clean transportation for all residents,
2 especially those in low-income and disadvantaged
3 communities. This heightens the importance of working
4 together to identify other potential funding sources for
5 this effort.

6 The third barrier is an overall lack of awareness
7 of clean transportation options due to a lack of access and
8 exposure to zero emission vehicles, clean mobility options
9 such as ridesharing in low-income communities. As well as
10 educational opportunities leading to reduced understanding
11 of the benefits of using clean transportation options.

12 And then the fourth is the further need to
13 integrated transportation planning including coordinated
14 land use and clean transportation policies across
15 communities. There's a challenge of differing geographic
16 and demographic -- demographics across communities which
17 creates a dynamic challenge and the need for multiple
18 community-driven solutions.

19 And it is important to note that many of these
20 barriers are similar to what other residents experience,
21 but as was mentioned, these barriers are magnified for
22 those that are low-income and living in disadvantaged
23 communities.

24 The next slide, what I'll do is cover the four
25 key recommendations categories that we've -- we've included

1 in the draft guidance document to be able to tackle the
2 main barriers that I just described. The first one is to
3 increase and prioritize funding on a current and new
4 programs for clean transportation and mobility options.
5 Examples include identifying permanent funding for current
6 and new programs. That incentivizes a purchaser lease of
7 new or used zero emission or near zero emission vehicles.
8 Clean mobility options including walking, biking,
9 ridesharing, car sharing services, clean transit, greening
10 the schools, reducing vehicle miles traveled. How do we
11 get people to be in more active transportation.

12 The second is expanding assessments to better
13 understand the clean -- the specific clean transportation
14 needs of low-income residents as part of a broader
15 transportation planning efforts. Some examples include
16 updating or developing new regional readiness plans for
17 local transportation and land use focused on low-income.
18 And ensuring a focus of low-income communities when
19 establishing priorities for funding programs that maximize
20 clean transportation access.

21 The third recommendation category is increasing
22 awareness for expanding and targeted education and
23 outreach. Examples of this include expanding educational
24 curricula for kindergarten through 12th grade. Increasing
25 knowledge of ridesharing and demand response options. And

1 other ways to utilize zero emission transportation and
2 active transportation options.

3 And the fourth category is maximize economic
4 opportunities and benefits from the investments made in
5 clean transportation. Examples include expanding access to
6 educational opportunities in clean transportation
7 production, maintenance, and infrastructure deployment,
8 vocational training, pre-apprenticeship and apprenticeship
9 program for clean transportation. Increasing access and
10 advancing knowledge and skills to acquire good quality
11 clean transportation jobs, and promoting affordable housing
12 to transportation planning and advancements.

13 And finally, the next steps which Michael and the
14 other folks have already talked about, we are going to
15 participate and we are participating in the taskforce that
16 was held, started last week. We are also planning on
17 updating our board on May 25th to provide them with the
18 results of what we've come up with and concluded. We also
19 plan to return to the case study communities and meet with
20 the low-income residents once again to let them know how
21 their input was incorporated to ensure that we properly
22 characterize the barriers and opportunities and help us
23 prioritize what recommendations in the near term we should
24 be focusing on along with long-term strategies.

25 And then based on board feedback, feedback we get

1 from the public, the communities, we'll finalize the
2 guidance document later this year.

3 As already been mentioned but I'll reiterate
4 again, it's been fantastic over the last year and a half
5 working with the local communities with all the different
6 state agencies. There's a lot of different agencies that
7 are working hard to increase access not only for
8 transportation but for energy -- for clean energy and clean
9 transportation. So I appreciate everyone's time. Thank
10 you.

11 MS. RAITT: Thank you, Sam.

12 So I'd like to move on to our first panel which
13 is solutions for multifamily building clean energy issues.
14 And I'd like to invite our panelists to please come up to
15 the tables. We have nameplates for you.

16 MR. PENNINGTON: So good morning. My name is
17 Phil Pennington. I work in the Energy Efficiency Division
18 at the Energy Commission. And I will be the moderator for
19 today's multifamily panel. There really is trying to focus
20 on solutions to how to substantially increase energy
21 efficiency and renewable generation upgrades to low-income
22 multifamily buildings.

23 Put that slide, please. Thanks.

24 We have an extremely strong panel here today made
25 up of both experts in trying to accomplish energy

1 efficiency and renewables in multifamily buildings as sort
2 of a program delivery experts. And also two
3 representatives of owners of multifamily buildings. So I
4 expect this to be a lively discussion. The people on the
5 panel are shown on the slide here, Maria Stamas of the
6 National Resources Defense Council. Vanessa Guerra of the
7 Mutual Housing California. Sophia Hartkopf of TRC
8 Solutions. Nick Dirr of the Association for Energy
9 Affordability. And Betsy McGovern-Garcia of Self Help
10 Enterprises.

11 Next slide.

12 So the findings of the low-income Barrier Study
13 led to the conclusion that achieving upgrades in low-income
14 multifamily buildings is critical -- is critically
15 important to accomplishing the governor's and legislature's
16 goals for extending the benefits of energy efficiency and
17 renewable energy generation to low-income persons and
18 disadvantaged communities. So the report includes this
19 particular recommendation, just kind of a sub-item under
20 the first recommendation that calls for a taskforce of
21 state agencies to develop a comprehensive plan that
22 emphasizes low-income multifamily rental properties.

23 As the lead off panel for today's implementation
24 workshop, our intent is to try to identify solutions for
25 these super important multifamily buildings.

1 Next slide.

2 So the low-income barriers report contained a lot
3 of information regarding the scope of multifamily buildings
4 and the problems that make it difficult for owners of low-
5 income multifamily buildings to make investments in energy
6 efficiency and renewable generation upgrades.

7 This slide is a quick summary of material in the
8 barriers report. The first three bullets show the large
9 scope of multifamily buildings and, you know, the
10 importance of that. A broad scope, 47 percent of low-
11 income households who live in multifamily buildings, about
12 20 percent of the multifamily units are rent assisted which
13 represents nine -- about 900,000 households. And 80
14 percent are market rate which represents about 2.4 million
15 households.

16 The next two bullets here highlight the ever
17 present split incentives problem where renters do not have
18 the authority to make upgrades that would deliver them
19 benefits of clean energy. And on the other side of the
20 picture, building owners often do not pay the dwelling unit
21 energy bills so there's limited motivation for the building
22 owners to invest in these upgrades that would benefit the
23 renters.

24 The rest of the bullets on this slide are focused
25 on the realities that face many low-income housing building

1 owners. Complex ownership is common for these buildings,
2 particularly for rent-assisted multifamily. And this means
3 that there are many bosses who have to agree with taking
4 risks to making upgrades.

5 Also the operation of multifamily buildings
6 provides very limited income and this results in very tight
7 operating budgets. As a result, energy efficiency tends to
8 be very much on the margin of how that budget gets spent
9 and tends to be, you know, the first thing to go when --
10 when the operation runs into difficulties. So also, you
11 know, the intent for the building owner needs to really be
12 careful with reserves so even if when there's reserves for
13 the billing operation, it tends to be difficult to spend
14 those on energy efficiency or renewal generation.

15 Also often the owners are unable to take on new
16 debt and then particularly for rent restricted multifamily
17 buildings, upgrades are often only feasible at the time of
18 rehab where refinancing occurs. And it's really difficult
19 to make upgrades sort of between a 15-year typical cycle of
20 rehabs.

21 Next slide, please.

22 So the charge to this panel today is to propose
23 solutions to substantially increase upgrades in low-income
24 housing. This necessarily requires a special focus on how
25 to motivate owners to invest in upgrades. There's several

1 dimensions that we want to address in the questions before
2 the panel. What would each panelist recommend and
3 substantially increase -- to substantially increase
4 upgrades for deed restricted housing and for market rate
5 housing, at major refinancing events, and outside of those
6 refinancing events and in building where the building owner
7 pays the utility bills and where the tenant pays the
8 utility bills. And also what changes would each panelists
9 make to current programs to enable owners to pursue more
10 upgrades.

11 So we're going to start out by having about 8
12 minutes or so allotted to each panelist to provide a quick
13 explanation of their role in low-income housing. And then
14 for them to make their burning recommendations related to
15 particular aspects of these questions that they have
16 selected to address. And not every panelist is going to
17 answer every piece of each one of these questions, but
18 hopefully the panel in totality will cover all these
19 questions and the parts of the questions.

20 Okay, with that as background, I'd like to begin
21 first with Maria Stamas.

22 MS. STAMAS: Good morning, Commissioners. And
23 thanks, Bill, and thanks for the opportunity to speak. And
24 thank you also to the California Energy Commission for the
25 barriers report and this extensive effort and focus on this

1 sector.

2 I'm Maria Stamas, I'm with the Natural Resources
3 Defense Council. And I primarily work at NRDC on a
4 national initiative called Energy Efficiency for All where
5 we're partnered with the affordable housing sector, program
6 implementers, and a host of over 80 organizations across
7 the country and including in California focused on bringing
8 affordable housing sector together with the energy sector
9 to focus on solutions for the multifamily low-income
10 housing sector.

11 Understanding as Bill laid out that there is huge
12 barriers but also huge opportunity. And so we've been at
13 this for over four years now and longer individually but
14 four years collaboratively and servicing solutions and
15 programs across the country that are working and that are
16 beginning to address a lot of these barriers that were laid
17 out.

18 So I wanted to focus today on three major themes
19 or principles in terms of solutions. And within each of
20 these themes, there is several sub-solutions.

21 So the first one is just focused on ensuring that
22 there's programs that are tailored for multifamily sectors
23 specifically and tailored to the needs of the owner and
24 ensuring that as we're designing programs, that the
25 constraints that owners face in this sector are at the fore

1 and understanding when they're able to make investments,
2 what constraints they're operating under, and designing
3 programs to help address those constraints.

4 So this takes a lot of different forms but, you
5 know, you can imagine just by speaking with owners a lot of
6 the solutions surface. So as one example, when we've been
7 speaking to affordable housing owners, you know, if you
8 imagine that you're an owner for a minute and say you're in
9 Los Angeles and you're trying to access programs for
10 retrofit, you have depending on how you count, between
11 about 28 and 36 different programs with different utility
12 administrators and also different state agencies that
13 administer these programs. It's unclear whether each of
14 these programs will have a budget by the time your
15 construction starts so you plan a project out, you know, at
16 least about a year ahead of when construction begins. So
17 it's unclear if incentives will be there, and then say you
18 get to the point where you're starting to apply to the
19 programs, you have, you know, at minimum, you know, say you
20 want to apply to seven different programs, you have seven
21 applications. But some programs are only tailored to
22 renters so each renter would have to first complete the
23 application. So if you have a hundred-unit property, you
24 have a hundred different applications for each resident
25 plus the six other programs. So you can start to

1 understand some of the complexities.

2 So I just want to highlight the importance of
3 working with owners and having focus groups and ensuring
4 that owners are part of the process and that programs are
5 designed specifically with the owner in mind. Since I've
6 laid out the owner is also responsible for authorizing
7 investments and making the investments in the property both
8 in the unit and in the common areas.

9 And wanted to highlight throughout these 8
10 minutes programs that are already doing this that we can
11 learn from. So in Massachusetts, there's a lien program.
12 And Massachusetts was actually very much had the landscapes
13 more to California today where there are lots of different
14 programs, different administrators, different
15 jurisdictions, and it was very relatively fragmented. And
16 so they came together and they created an advisory
17 committee that included owners and they revamped their
18 program that is combined with utilities and federal
19 weatherization and they have an administrator that oversees
20 all of the different programs on the back end and they
21 created a single online portal for owners. And so you go
22 to one website, you enter your basic information, and
23 somebody will follow up with you and take you through the
24 process and there's a single application, a single landing
25 point, and it's very easy for an owner to understand where

1 to go. So that's just an example on that end. So the
2 theme work with owners, make sure they're part of the
3 process and a lot of solutions will come from that.

4 The second point I want to emphasize and this
5 follows the first point is the importance of one-stop
6 intake and robust technical assistance. And so owners
7 across the board but I think especially in rent-assisted
8 housing and low-income housing overall, they have very
9 limited bandwidth and they often don't have staff that are
10 experts in energy or experts in all the programs that are
11 out there. And so to the extent a program administrator
12 can really provide robust technical assistance for owners
13 to help them through the process, that's been really
14 helpful.

15 And so we have a lot of examples of programs that
16 are doing this today actually in California even so the
17 low-income weatherization program that's funded through the
18 greenhouse gas reduction fund and overseen by the Community
19 Service and Development Department. That program is
20 providing very robust technical assistance and is currently
21 fully subscribed. I'd like to say as in part of a result
22 of that.

23 And just briefly, often when we talk about
24 technical assistance, I get a lot of questions well, what
25 does that really mean? What's technical assistance? So

1 want to just go through a list of some of what we think
2 about with technical assistance. Owner consultation,
3 benchmarking, onsite property assessment, negotiating with
4 an owner the scope of the project, energy modeling,
5 auditing, helping with procuring bids, working on
6 permitting assistance, ongoing project management
7 assistance. And all this can be tailored depending on the
8 needs of the owner.

9 And that might sound really expensive but what
10 we're seeing or my understanding from different programs is
11 it's averaging about 50 to \$100 per unit. So if you think
12 about the overall cost of a project, that's really a small,
13 small percentage but it's really helpful for owners and
14 really critical.

15 And then the last category of recommendations I
16 wanted to mention and Bill had asked us to speak to this,
17 too, is metrics and goals and what are the best metrics to
18 be using and how does data inform all of this. And so I
19 think I cannot underscore the importance of goals and then
20 sharing that what's driving program design is properly
21 aligned with, you know, the overall state goals of ensuring
22 that we're reducing bills for low-income residence and
23 capturing as much energy savings and greenhouse gas
24 reductions as possible. So, you know, having an energy
25 savings goal or greenhouse gas reduction goal is really

1 important and that directly corresponds with lower bills
2 because the more energy you save, the less bills you have
3 to pay.

4 I think right now a lot of -- right now, a lot of
5 the programs that are out there in California don't -- for
6 low-income specifically don't have an energy savings goal
7 or that really drives programs. And so want to emphasize
8 the importance of that.

9 Other nontraditional goals or metrics, program
10 uptakes. So when you initially reach out to an owner, do
11 they actually complete the retrofit at the end of the day
12 and what's that percentage of initial contact to
13 completion. And from other programs that have this one-
14 stop intake and robust technical assistance in Chicago,
15 they're seeing rates of from the first outreach to the
16 owner to the completion of the property, over 40 percent of
17 owners are going through that process. In comparison, a
18 lot of other programs that don't have that robust one-stop
19 intake in technical assistance are about 7 percent. So
20 that's an interesting metric to follow.

21 How many other programs did an administrator
22 enroll an owner in and that's not the program that the
23 administrator is overseeing. So I think Commissioner
24 Peterman had asked about, you know, coordinating with
25 electric vehicle programs so what about a goal or a metric

1 for an energy efficiency program that also tracks how many
2 owners that participated in your program also participated
3 in electric vehicle programs.

4 There's a host of others and I'm happy to go
5 through them but just want to emphasize overall the
6 importance of goals and metrics.

7 And then lastly, this sort of falls in this
8 category of providing market certainty. And so this isn't
9 necessarily a goal, but knowing that there's going to be
10 funds at least a couple of years out or that a program will
11 be around for longer than a year at a time. Right now a
12 lot of the multifamily programs in California are operating
13 on one-year cycles or when they're newly launched, they run
14 out of funding and it's unclear when they'll be restarted.
15 So the low-income authorization program multifamily program
16 that's available for disadvantaged communities right now,
17 it's currently operating on a waitlist. And owners while
18 they really like the program, they're not sure if it's
19 going to be around and that reduces market certainty which
20 also affects job development and the whole -- whole host of
21 everything that goes with that.

22 So with those three areas, just want to emphasize
23 again that there are solutions out there for all the
24 barriers that been addressed and whether it's in California
25 or other jurisdictions that this is really possible. And

1 so I appreciate the increased focus on these issues and
2 look forward to the discussion.

3 MS. GUERRA: Good morning, Commissioners, my name
4 is -- thank you.

5 My name is Vanessa Guerra, I'm with Mutual
6 Housing California. We're a nonprofit affordable housing
7 developer here in the Greater Sacramento area. We actually
8 are very committed to building more sustainable housing and
9 also upgrading our existing portfolio to be as energy
10 efficient as possible. However, I just want to say that
11 the largest barrier that we do face, of course, is the lack
12 of funding to carry out this type of work. So it's really
13 important that we focus on finding programs and of course
14 also being supportive of existing programs that are in
15 place that are really helping us tackle this major barrier.

16 And so some of the recommendations that I wanted
17 to talk about today actually touch on some of those
18 programs that are in place right now and that Maria did
19 mention that are really important to our ability to really
20 try to capture as much funding or financing available to
21 support these types of improvements for our properties.

22 The first one I'd like to talk about is the
23 California Utility Allowance Calculator, the CUAC. This is
24 something very important and critical to all of our
25 developments, especially those that utilize low-income

1 housing tax credits. That's one of the biggest financing
2 mechanisms that we use to develop our housing.

3 And so with that said, we definitely, we found
4 that this is so important to all of our new construction
5 where we've had experience on our latest development which
6 is an all-electric 100 percent ZNE multifamily development
7 in the city of Woodland. And of course that essentially
8 allowed us to capture enough savings from the utilities,
9 savings that the residents get in order for us to actually
10 generate more net operating income from the rents that they
11 contribute toward this property so that we can support a
12 higher debt and essentially cover or help finance the costs
13 of all of these additional upgrades that we included in
14 this development.

15 However, the challenge that we've been facing
16 with retrofits is that we can't use it on these existing
17 buildings. And not quite certain as to the real -- well,
18 not the real, but not too certain on the actual barrier as
19 to why we can't really use them but from my understanding
20 is that the Tax Credit Allocation Committee doesn't have
21 the resources to actually monitor this higher volume --
22 excuse me, this higher volume of developments that would be
23 using the California Utility Allowance for their
24 properties.

25 So I think it's important that the CEC and the

1 California Tax -- Tax Credit Allocation Committee work
2 together in trying to find ways to support that lack of
3 resource that they need to really help us implement the
4 CUAC for our retrofits because again the CUAC allows us to
5 leverage hundreds of thousands of dollars that we can use
6 to essentially cover the cost of these additional upgrades.

7 So another program that has been very useful as
8 well but we've seen challenges with is the low-income
9 weatherization program that essentially a lot of our
10 properties weren't able to participate in because of
11 certain barriers that were there. One of the biggest ones
12 was essentially that this program was only targeting
13 disadvan -- or properties that are in disadvantaged
14 communities. And so that kind of -- although some of our
15 properties did qualify, others, most were actually cut out
16 so they weren't able to even apply.

17 And again going back to the funding need, higher
18 rebates, of course, higher incentive levels because again
19 there's such a lack of resources available within the
20 property itself, its reserves are very limited so to be
21 able to leverage more incentive would make it more feasible
22 for us to actual do these kinds of upgrades to all of our
23 existing properties.

24 Another thing with that program is the threshold
25 requirements that really make it harder for these

1 developments to do at least a smaller scale type of
2 improvement. Having a threshold really kind of creates
3 that barrier again for us to do at least small improvements
4 to the properties. And by eliminating that and maybe
5 making the program to be kind of more of an ongoing program
6 where a property over the course of time not just within a
7 certain period of let's say six months or a year have to do
8 all of these major improvements, but over several years,
9 it's an ongoing program where the properties can apply to,
10 you know, replace one water heater at a time and that way
11 it provides that property at least enough time. And at
12 least it has the capacity and the financial resources to at
13 least cover the smaller size types of developments over the
14 course of time rather than just doing one big part or one
15 big improvement that essentially most properties don't have
16 the internal resources to handle.

17 So those are the only solutions that I have
18 proposed for now but I'll give some more time to the rest
19 of my colleagues here to talk about those more.

20 MR. PENNINGTON: Thanks, Vanessa.

21 Sophia.

22 MS. HARTKOPF: Great. Hi, there. My name is
23 Sophia Hartkopf, I work with TRC Energy Services. We are a
24 consulting firm that implements and designs multifamily
25 programs around California and actually nationwide. I've

1 been working in this industry for a little over 11 years
2 trying to crack the split incentive issue that we all know
3 is very real in the multifamily sector.

4 And I want to talk about a couple points. I
5 don't have as many overarching conclusions as -- or big
6 conclusions that Maria has but I want to touch on a few
7 that we've already discussed and reemphasize them. I'm
8 sure I'm not going to be the last that's going to be making
9 the same points over and over again.

10 To build upon Vanessa's comments about ensuring
11 that the program meets the needs of the property, and also
12 Maria's, I think in general one of the solutions that I see
13 is that programs should provide multiple opportunities for
14 an owner to enter. It should not be a one size fits all
15 solution of you must meet this qualification criteria and
16 this percent improvement above your existing conditions,
17 for example, in terms of your scope or, you know, this --
18 this number of years of since you've received the low-
19 income program services but rather provide them with a menu
20 of options and help steer them toward the option that makes
21 the most sense to them. And part of that involves really
22 thinking more strategically within the framework of our
23 state programs and our utility programs of offering
24 multiple options without overkill. There's an issue, of
25 course, offering too many options and making it confusing

1 to the customer.

2 So one solution that we've seen with some of the
3 programs that we administer is in PG&E's program we've been
4 able to for example provide in incremental or phased
5 approach so essentially allowing the owner to not have to
6 do everything within a calendar year which is one of the
7 key barriers that Maria and others have brought up
8 currently that we face with one year, calendar year
9 budgets. And it has been extremely successful in allowing
10 owners to address upgrades in the common areas, for
11 example, first, and then follow with tenant improvements
12 either at turnover or at other key points without needing
13 to disrupt the tenants the same way. And it allows them to
14 phase their budgets and remedy some cash flow issues.

15 This program has been very limited, though, in
16 terms of our funding so I think, you know, there's a real
17 opportunity to expand this and to look at this and other
18 programs as well.

19 With that, I'm going to move on to some other
20 recommendations. So I think we're all going to echo the
21 same point about technical assistance and the importance of
22 that assistance. A lot of these owners are very motivated
23 but don't necessarily to have the resources to really drive
24 the decision making and make the best decisions as it
25 relates to energy efficiency or other clean energy

1 resources at their properties. And we can't necessarily
2 assume that every owner needs the same type of technical
3 assistance, so really needs to be customized to the needs
4 of the owners. That may mean in some cases an ASHRAE
5 Level 2 audit which we've all kind of agree is for the
6 industry standard for whole building comprehensive
7 retrofits may not be appropriate for an owner that's
8 looking to do a lighter touch improvement. So allowing
9 some flexibility and the types of technical assistance that
10 we provide is also very important.

11 I think another key solution that I, you know, as
12 an implementer and someone who runs these types of
13 programs, you would think would be obvious but still
14 something that we're constantly working on is making sure
15 that there is a really transparent process that we can
16 explain to the owner. Transparency is so important. Being
17 able to explain up front each of the steps that you can
18 expect, this is the rough time frame what it's going to
19 take to get through these steps. These are the times we're
20 going to be asking for the following forms from you. We're
21 working right now to develop something similar for the low-
22 income weatherization program which overall has been
23 extremely successful at providing this level of support and
24 giving owners, you know, a real sense of what the time
25 frame is and the objectives. But there's still a lot of

1 potential to improve how we communicate those steps and
2 those processes.

3 Another area where I think -- and I see this as a
4 real opportunity and it's still something we need to work
5 on is ensuring that we have a real clear understanding of
6 what the leveraging process will look like for leveraging
7 multiple funding sources. So most affordable housing
8 projects, deed restricted in particular, in order to make a
9 retrofit happen of any scale are going to be are leveraging
10 multiple sources of funding.

11 Typically, you know, the typical low-income
12 weatherization project, for example, is going to be
13 leveraging at least the Tax Credit Allocation TCAC program
14 or the low-income tax credits. And likely also utility
15 funding source or possibly a water district funding source.
16 And, you know, we have some great procedures in place for
17 how we can begin to segregate the influence of the
18 different programs and how to best pull apart the savings,
19 for example. But I think there needs to be a pol -- some
20 policy thinking on this in terms of a policy framework of
21 how we can make that sustainable. Because if we're
22 competing for savings, which we're not yet, it -- we will
23 really be having a tough time making some of these
24 retrofits possible.

25 Another key solution is related to the way that

1 we speak to the customers or speak to the multifamily
2 building owners. What drives a traditional deed restricted
3 affordable housing property like Vanessa's is going to be
4 very different than what drives a typical sort of market
5 rate owner that has some low-income or predominantly low-
6 income tenants inside of their property. In general we
7 found for for-profit owners or owners that are overseeing
8 non-deed restrictive properties, you really got to talk to
9 them about their operating income and their vacancy rates
10 and anything that drives the business end of their -- of
11 their -- of their work.

12 And that's not to say that you don't have that
13 same conversation with the affordable housing owners but
14 they're generally more driven to, you know, support their
15 tenants, provide tenant comfort and also, of course, they
16 are concerned, of course, about operating income as well.

17 Secondly as it relates to addressing the -- or
18 targeting the different types of multifamily buildings that
19 we see, we found an incredible success at -- for market
20 rate sector really targeting those buildings at time of
21 acquisition or sale. That's when they have significant
22 amount of funding that they're getting from a bank or other
23 sources and they're really willing to make substantial
24 improvements to the property.

25 But as a lot of us has already discussed so far,

1 this is -- it's a timing issue. So it's dependent upon
2 whether you can get that perfect window when either the
3 property is being acquired or sold to make those retrofits
4 within the time frame of the program. So that's definitely
5 still a challenge.

6 And then I'd also like to touch upon trade
7 allies. So, you know, many of the programs have seen
8 success in providing robust technical assistance sort of
9 in-house where the program administrator really does the
10 bulk of the heavy lifting on the front end in terms of
11 establishing the energy savings. But I would also
12 encourage us not to underestimate the power of trade allies
13 in really driving program's success and expanding savings.
14 Trade allies such as contractors or consultants that serve
15 building owners in other ways, either for tax credit
16 purposes or for, you know, their other energy management
17 needs are very driven to convince the owners to making
18 improvements since of course it affects their bottom line.
19 And if they are empowered and they have the right resources
20 and the right -- and the program serves them appropriately,
21 their -- they will drive the success of the program. On
22 average, we've seen with our utility programs that roughly
23 50 percent of projects come in through trade allies.

24 And then I think I'm going to stop soon because
25 I'm probably going too long. But lastly, I just want to

1 touch on how to -- how we've seen success in combining
2 program models. I spoke a little bit about how a lot of us
3 work in whole building or comprehensive retrofits. But
4 there's also a need for direct install or, you know, low-
5 cost menu-based programs. And as an example, and this is
6 not in California, but in New Mexico, we're working on a
7 multifamily program where the owners have never -- had
8 never seen an energy efficient program come to them before.
9 And they were ultimately doing a direct install sort of a
10 first step into -- into their buildings was a great entre
11 into getting them interested in a deeper improvement over
12 time.

13 So we found just doing a few free measures,
14 assuming that they are well-installed and well-specified,
15 and, you know, high-quality, have resulted in, you know, a
16 longer term relationship with that owner that resulted in a
17 deeper retrofit over time.

18 So I'm going to leave it at that. Thank you very
19 much for the opportunity to speak.

20 MR. PENNINGTON: Thanks. Thanks a lot.

21 Nick.

22 MR. DIRR: Hi. My name is Nick Dirr, I work with
23 the Association for Energy Affordability, AEA for short.
24 We're a nonprofit technical assistance and program
25 orientation firm, primarily focused on multifamily.

1 Currently we're the implementer for the LIWA multifamily
2 program in the state. We're also implementing the barren
3 multifamily program as well as the MCE multifamily program.
4 We provide direct consulting services to building owners
5 and the utility programs as well as within tax credits and
6 for new construction Title 24 projects.

7 In general, I think I'll touch on a lot of what's
8 already been mentioned and add a few new things as well.
9 To second the comment around program timelines, that is
10 really important for a number of reasons. You need longer
11 program timelines especially for projects that are going
12 through the major refinancing event. So we talked about
13 that construction process may be happening 12 to 16 months.
14 But even before then, there's design development,
15 financing, architect procurement, general contractor
16 procurement, and so especially deed restricted multifamily
17 building or market rate going under long timelines need to
18 have that program confidence that it's going to be there
19 and the rebates are available.

20 And it's also just important to get program
21 momentum. So what we typically see in a lot of our
22 programs is kind of people dip their toes into the program
23 a bit, they bring in one or two projects, they want to see
24 how it goes. After it goes really well, then they come
25 back with two, three, four, five additional projects they

1 want to take through the program. So as long as we can
2 have longer programs there, then we can capture that
3 momentum that's building within the market.

4 Secondly, I think in regards to addressing the
5 split incentive, I mean, that's a major challenge and a
6 major hurdle. We've tried a few different structures in
7 the LIWA program that we've offered is that for end unit
8 measures, the measures that are saving tenant energy, we
9 offer 25 percent higher incentives than we do for measures
10 that are saving energy. So we're trying to recognize that
11 yes, that split incentive is there, we're willing to
12 provide higher rebates to help that work happen.

13 In that program, we also do have a savings
14 threshold. There definitely are challenges with that. And
15 hopefully longer program timelines that allow for phasing
16 can help maybe be a compromise. But what we find
17 indirectly with buildings, especially the market rate
18 folks, that maybe are trying to run a business and are not
19 as focused as energy efficiency or maybe don't have an
20 organizational energy efficiency goal. In that program,
21 you have to achieve a certain energy savings over existing
22 conditions, either 15 percent or 25 percent. So indirectly
23 we end up encouraging folks to tackle measures within the
24 units.

25 So it can get access to incentives for their

1 common area measures, of their owner offset measures,
2 potentially at an incentive rate that's higher than just
3 standalone widget-based programs. But in order to do that,
4 they also need to invest on the upgrades within the units.
5 They end up getting there to that 15 or 25 percent
6 threshold by packing all those measures together.

7 Also on the market rate side, it's talking to the
8 owners again because they are running a business. So, you
9 know, energy efficiency is important for them to get tenant
10 retention and maybe attract higher rents. But that isn't
11 ideal on a low-income framework. So then it's also
12 targeting things such as reduced maintenance cost or
13 incurred costs they're going to have in a few years. So
14 explaining to them, you know, the furnaces that you have in
15 these units right now, they're old already or they're going
16 to be needing to be replaced in a few years, why not do it
17 now with a program, do it with a higher efficiency furnace,
18 get some rebates for it rather than waiting until it dies
19 and you have to just replace it with the same thing that
20 was there before.

21 And then I guess my final recommendation around
22 recommendations for current programs and this one's kind of
23 behind the scenes a bit at the policy level. So as the
24 joint task group's agencies are coming together to
25 recommend new programs going forward around low-income,

1 traditionally there's some policy requirements that make
2 broad programs and programs that have a lot of depth of
3 intervention challenging primarily around total resource
4 cost, net gross, and what is being qualified as the
5 baseline conditions whether that's existing or are of code,
6 so it's very difficult to develop a program that is a deep
7 energy savings program and can scale when you're also
8 trying to fit within a TRC framework or working with
9 certain up to gross or baseline issues.

10 So as more broad longer term low-income
11 multifamily programs are being developed, recognizing that
12 there's policy metrics and requirements are important would
13 be really useful.

14 And I think that's all I have for now. I know
15 that was pretty quick so you made up some time. But I'm
16 available to answer questions throughout.

17 MR. MCGOVERN-GARCIA: All right.

18 MR. PENNINGTON: Betsy. Thank you.

19 MR. MCGOVERN-GARCIA: Okay. Well, good morning,
20 my name is Betsy McGovern-Garcia, I'm the director of Real
21 Estate Development for Self Help Enterprises. And we are a
22 nonprofit community-based organization. We've been around
23 50 years and we serve the San Joaquin valley, eight
24 counties. We have 28 multifamily properties and that
25 equates to 1300 units. All 1300 of our units serve low-

1 income working families at or below 80 percent of area
2 median income, and they're all deed restricted units.

3 I'd like to just thank you for the opportunity to
4 be here. We're in the trenches currently implementing LIWP
5 and new solar homes partnership and MASH and multifamily
6 upgrade program projects and it's nice to have the
7 opportunity to step back from those projects and just kind
8 of reflect on what some of the challenges and successes
9 have been under those programs.

10 All of our sites but one the tenant pays the
11 utility bills so we have a tremendously challenging time
12 accessing data. Also the majority of our sites are garden
13 sale townhome apartments and so they're in fourplex and
14 sixplex configurations. And so they don't always meet what
15 people have in mind when they think of multifamily
16 apartments, high-rises, more urban projects.

17 We recently completed about \$4 million of LIWP
18 upgrades at five of our sites. That equated to just under
19 a megawatt of solar and an average energy reduction of 43
20 percent. 90 percent of that benefit on average went to our
21 residents, and three of the five sites will be zero net
22 energy. Two of them were done in conjunction with the re-
23 syndication refinancing event and three of them were
24 standalone upgrades. So we've got experience on both sides
25 of the fence of using programs with refinancing or

1 independent of refinancing.

2 In addressing Question Number 1, upgrades to deed
3 restricted housing, I offer the following recommendations.
4 Technical assistance. Have we heard this yet today a
5 little bit?

6 Through the LIWP program, it was an amazing
7 experience because the first thing that AEA did in
8 implementing that program is that they came to our sites.
9 They got out of their offices, they came to our sites, they
10 counted our light bulbs, they looked at all of our HVAC
11 units, they inspected our water heaters and how those
12 systems functioned. And that afforded them the opportunity
13 to make really thoughtful extensive recommendations on what
14 we could do to conserve energy in those projects.

15 I can't tell you how many times I've received a
16 beautiful marketing flyer for an IOU operated program and I
17 call and someone's on the phone and they have no knowledge
18 of my site, no ability to answer my questions because
19 they're in their office. And getting technical assistance
20 where they come out, they inspect your sites, they work
21 with you, tremendously, tremendously beneficial.

22 Secondly, investing in existing programs. Maria
23 talked about program certainty. We plan our projects three
24 to five years in advance and it will frequently take us
25 three years to get the financing that we need. We're

1 sitting for, waiting for resources from programs like AB
2 693 to come down the pipeline. When we have existing
3 programs that work, we have LIWP that works, we have the
4 MASH program, the new solar homes partnership. All of
5 these programs that we use and then the next year when
6 we've had a successful project and we want to replicate
7 that, we go back to apply and there's no resources and
8 we're waitlisted. It's extremely frustrating for an
9 affordable housing developer and operator and it makes it
10 really, really challenging to plan for projects.

11 I'd like you to consider cash flow in conjunction
12 with incentive programs. We had to front all of the money
13 for the LIWP projects and so we were fronting. Right now
14 we're carrying about \$3.8 million worth of energy
15 efficiency on our books. We're fortunate in that we've
16 been a diligent nonprofit and we have the capability to do
17 that and we've secured some funding from CPFI to offset
18 those expenses, but not every organization has the ability
19 or the willingness to do that. And so if you're looking
20 for large meaningful upgrades that are costly, there needs
21 to be some mechanism to fund those expenses upfront and not
22 just on a reimbursement basis.

23 I think if you combine incentives that actually
24 cover the majority of the cost for tenant loads in
25 conjunction with really robust technical assistance, you're

1 going to see nonprofits like ours that are focused on our
2 working families implementing those types of retrofits.
3 All five of our projects are in rural communities and rural
4 disadvantaged communities. It's one thing to be in a place
5 like L.A. with 36 programs, it's another thing to be in
6 rural Wasco and Kern County and have maybe one program that
7 gets funding, you know, maybe for two months and then it's
8 oversubscribed. And so if the state really wants to
9 achieve broad statewide energy efficiency targets and
10 outcomes, they need to continue focusing resources on rural
11 communities and disadvantaged communities.

12 Just a bit about some current programs that we
13 work under that are exciting and challenging at the same
14 time. AB 802, we love. We wished that we had a portfolio
15 manager count with data for all 1,347 units. We look at
16 data to drive capital investments and we want access to
17 that data. Unfortunately under AB 802, there's the
18 requirement that buildings be five units or larger so 95
19 percent of our portfolio we cannot get data for because
20 they're all fourplex units.

21 We want the ability to work with our IOUs to get
22 that data. We want it aggregated. I don't want to look at
23 every single account. I want aggregated data for my sites
24 so I know how to size solar, I know where to target my
25 investments. I want to be able to identify my five most

1 egregious energy users and direct investments towards those
2 sites. So I'd urge you to look at data accessibility under
3 AB 802 and provide a mechanism for us to aggregate our
4 buildings to meet that five unit requirement.

5 Secondly, expanding the VNEM MASH tariff
6 structure under LIWP because we were not receiving a MASH
7 incentive, we were unable to use that tariff. It made it
8 extremely, extremely challenging and we would not do this
9 again. We had to basically install five mini solar systems
10 that linked to different buildings and then allocate
11 generation credits based on those mini systems within our
12 larger site because we were not being VNEM MASH eligible.
13 We need to have the ability to aggregate larger scale solar
14 and then allocate the generation credits evenly over the
15 site. If VNEM MASH was eligible for projects that are MASH
16 eligible but just don't get the incentives because there's
17 not money, we would have more flexibility under programs
18 like LIWP and using low-income housing tax credits to
19 aggregate that solar and implement more of those types of
20 projects.

21 Finally, I'd like to urge you to look at making
22 solar interconnection easier. I have a fully constructed
23 solar system that's going to sit on one of our sites for
24 probably five months accumulating a lot of dust but
25 actually not generating any energy whatsoever because of

1 interconnection. That system is about a \$400,000 system
2 and we're looking at spending \$70,000 to interconnect that
3 system which is 16.5 percent of that. Typically we've been
4 able to interconnect through the utility pole section of
5 the utility service panel, most pole sections have enough
6 space for interconnection. However, in the last couple of
7 years, utilities have been rejecting those interconnections
8 and only allowing the line side tap to be in customer
9 section of the panels.

10 If generation meters are required under VNEM
11 MASH, then -- and the utility does not want the contractor
12 to make connection in the utility section, then the utility
13 should be required to provide the interconnection line side
14 tap that we can connect into for interconnection at a fixed
15 fee. Perfect example of this is the plug-in electric
16 vehicle incentive structure that requires a new meter and
17 that requires the IOU to provide that connection point for
18 a fixed fee of a couple hundred dollars. Absolutely
19 streamlines plug-in electric vehicle charger installation
20 and makes those projects feasible and we would encourage
21 you to look at a similar mechanism. Under VNEM MASH for
22 qualified LIWP deed restricted-type projects to
23 interconnect those systems easily.

24 And, finally the last thing that I want to say is
25 our organization is also looking at plug-in electric

1 vehicle rideshare so we're going to be participating in a
2 couple of pilots hopefully through the ARB and CEC for
3 deploying battery plug-in electric vehicles at our
4 multifamily sites. The majority of which are in rural
5 communities and allowing rideshare and ride sourcing
6 opportunities for residents at no charge.

7 We're doing that in conjunction with the larger
8 suite of transportation improvements through the affordable
9 housing and sustainable communities program which is a
10 greenhouse gas reduction fund program. Our goal is to have
11 chargers on site that are charging plug-in electric
12 vehicles that are powered by solar and our residents have
13 an opportunity to take van pool to work during the day and
14 share rides with their neighbors. Come home, swipe the
15 same card, get in their plug electric vehicle, go get
16 groceries, come home, be in an energy efficient unit that
17 zero net energy because they also realize the benefit of
18 solar.

19 So we're excited about that and we're excited
20 that you're paving the way for that and I hope to be
21 sitting in front of you a year from now telling you the
22 successes and challenges in launching that also.

23 So thank you for having us today.

24 MR. PENNINGTON: So Mr. Chairman, we endeavor
25 here to be succinct in our presentations and turn it over

1 to you for comments, questions.

2 MR. WEISENMILLER: Great. Thank you. These
3 turned out just a couple.

4 First, I was going to say at the beginning of
5 this panel, Bill put up a list of an overview of the
6 multifamily issues. One thing that I'd be interested to
7 either now or obviously in your written comment if you
8 could discuss that characterization, is there anything
9 missing in that -- so go up. Yeah, this one. So anyway,
10 if there is anything missing in this, it would be good to
11 bring it up now or later.

12 Also I wanted to really thank Maria for reaching
13 out. We had obviously as we were running through the
14 barriers report, you know, the report talked a lot about
15 split incentives and a lot about how, you know, many people
16 in housing and we're trying to know what to do and she set
17 up a group meeting for myself and Andrew to go and really
18 pull together owners, occupants, and really lay the
19 foundation for I think this workshop. And again what we're
20 struggling with and we talked about split incentives for
21 the last 40 years or so. But anyway trying to actually
22 make some progress is what we're struggling to do at this
23 point. So hopefully, this workshop is a basis for making
24 further progress on this.

25 So let's just start with is there anything

1 missing on this summary? And then I'll certainly ask my
2 fellow -- my colleagues to sort of follow up on my
3 questions.

4 MS. HARTKOPF: I guess I can add the time frame
5 issue that we've been discussing is probably not here. So
6 refinancing does not necessarily align with program budgets
7 or budget -- fiscal budget planning for property, it
8 doesn't always align with program budgets.

9 MS. MCGOVERN-GARCIA: And I don't see data on the
10 list and access to data. I would say that's a huge
11 challenge.

12 MS. STAMAS: I would add in terms of budgets, I
13 mean, the tight budgets for owners but also tight budgets
14 for multifamily programs at the state and customer funded
15 level. We did a back of the envelope calculation and found
16 that, you know, under generous assumptions, including the
17 Energy Savings Assistance Program that was authorized but
18 not out yet that less than 5 percent of overall funding is
19 going to multifamily. So about 70 million a year out of
20 1.5 billion is going to the multifamily section. So
21 there's not a lot of incentive funding or program funding
22 available.

23 MS. HARTKOPF: And actually, this was Nick's
24 point but the point about the cost effective this criteria
25 that we're held to for some programs and not for others.

1 And the -- the constraints that we face with that
2 especially for low-income programs and the need to consider
3 some of the points that Maria brought up with regards to
4 providing a mechanism for sharing projects across programs.

5 And I guess we could probably also talk about
6 spillover and other, you know, these are classic issues
7 that are being discussed at the regulatory way outside of
8 the session. But, you know, we can't run -- we can't do
9 market transformation under the current cost effectiveness
10 criteria without getting a very low score.

11 MS. STAMAS: And just to emphasize that point or
12 provide some examples. Even with so the Energy Savings
13 Assistance Program has co-benefits or nonenergy benefits as
14 part of the cost effectiveness calculation but it's still
15 based on the total resource cost test which includes as a
16 cost the amount of funding that the owner invests in the
17 property for the projects. So while we also want owners to
18 have copays, the cost that the owner's invest in their
19 property is also considered a cost for the program. So
20 that's an example of how the cost effectiveness test can be
21 a little bit overconstraining for the sector.

22 And then on spillover free ridership, for
23 example, a lot of times, you know, we talk about aligning
24 incentives with the tax cut allocation process and ensuring
25 that while an owner's accessing tax credits, they're also

1 able to leverage programs but oftentimes if an owner
2 leverages a program with that tax credit as well, then it's
3 considered that they're free riding and so the savings
4 aren't counted. So, you know, there's details in the
5 metrics and the cost effectiveness that bear a closer look.

6 MS. PETERMAN: Thank you very much for the
7 presentations, very interesting. I have two questions.

8 The first is for Mr. Dirr. You mentioned that
9 you provide a higher incentive when the savings accrue
10 exclusively to the tenant. Once you add that higher
11 incentive, what share of the actual project cost is then
12 covered through incentives? And have you found and maybe
13 Ms. McGovern-Garcia has a thought on this too about how
14 much you need to really cover to incentivize the property
15 owner to then make those improvements?

16 MR. DIRR: Sure. And it really is a case by case
17 basis for a lot of these properties, especially the deed
18 restricted properties. You know, some have available
19 reserves that can -- should be funds. Other ones have been
20 running in the red and need close to 100 percent financing
21 for the project. Even with the 25 percent higher incentive
22 for tenant savings measures, you're able to kind of go from
23 the low hanging fruit to the medium height fruit, but
24 things such as HVAC in particular, individual water
25 heating, we're still only covering maybe 50 percent of the

1 cost of those measures. But without that, we would be, you
2 know, 25 percent, 30 percent of cost and that's just
3 infeasible for a lot of these properties to be able to
4 undertake that.

5 MS. PETERMAN: Thank you. And then my -- oh,
6 please, ma'am. Please go ahead.

7 MS. MCGOVERN-GARCIA: Yeah, I would just say
8 that, you know, on our projects that we were doing with a
9 re-syndication, a refinancing event, that the incentives
10 are probably covering 70 percent of that cost. We were
11 only able to do those because we were refinancing and could
12 offset that expensive through the low-income housing tax
13 credits.

14 At some of our really old sites with really old
15 equipment, the new upgrades yielded so much energy
16 conservation that it was almost 100 percent coverage. I
17 think if we see programs in the 90 to 100 percent incentive
18 coverage range for tenant loads, we would do those projects
19 all day long. Because AEA was able to provide such a high
20 level of technical assistance, they helped us figure out
21 what that meant, where the equipment was, who the vendors
22 were all of those things. It was a no-brainer for us. But
23 absolutely getting into that 90 to 100 percent range for
24 tenant offloads is what really makes it feasible.

25 MS. PETERMAN: And just to clarify ON that, so

1 that 90 to 100 percent includes the energy savings to the
2 tenant as a part of that calculation?

3 MS. MCGOVERN-GARCIA: The tenant. Yeah.

4 MS. PETERMAN: Okay.

5 MS. MCGOVERN-GARCIA: And in some scenarios, the
6 tenant offsets were 100 percent and maybe the common area
7 ended up being 50 percent, but we were able to absorb -- we
8 were able to finance through that through the cash flow of
9 the project. And the combination of those two things
10 together actually put together a really great project or a
11 combination of incentives to make those projects feasible.

12 MS. PETERMAN: Thank you, and then I had just one
13 follow-up question for you. So it seems that your
14 organization has been able to take advantage of a variety
15 of programs across energy efficiency and clean energy. And
16 one of the comments made was the importance of having a
17 more simplified set of interfaces to all these programs.

18 And so from -- how does your organization do it?
19 Do you have one person that's following each program? Do
20 you have a regular utility contact that's making you aware
21 of everything? I mean, how have you been able to follow
22 the different paths of money successfully?

23 MS. MCGOVERN-GARCIA: Yeah, it has been
24 challenging and it has been hard for us. We don't have a
25 dedicated staffer. We're housers, we're not

1 environmentalists so we are houses, affordable housing.
2 But usually it's on a case by case basis and we need those
3 incentives to do solar, we need those incentives to achieve
4 a higher level of energy efficiency. So we actively seek
5 those out.

6 We had one scenario under the new solar homes
7 partnership where we were in for one energy efficiency
8 program that was required for the solar incentive and then
9 they kicked us out because our community building was a
10 commercial use and that energy efficiency program was only
11 residential and so then we had to roll in a second energy
12 efficiency program.

13 It has not been easy, it's a struggle every day
14 to maneuver the different programs. If there was one
15 clearinghouse or one ombudsman that knew all the programs
16 that could help us facilitate that, we would be able to
17 deploy those projects on a more larger scale. And so we
18 just do our best to keep working at it and figuring out
19 what the programs are and making them work for our
20 projects, but it hasn't been an easy road.

21 MS. HARTKOPF: I don't know if this is directly
22 relevant but a few years ago a number of folks at this
23 table worked to develop a clearinghouse called the Funding
24 Finder. It was funded through the ARRA stimulus package.
25 It's no longer being updated but it might be something

1 worth revisiting. It basically provided the owner with an
2 option to put in some very basic property information and
3 then it directed them to available programs through both
4 state agencies and utilities and other sources. So doesn't
5 help with the application process in terms of what taking
6 the next step but at least being aware of what your options
7 are was the intent. So that's something that maybe worth
8 revisiting.

9 MR. RECHTSCHAFFEN: Can I ask, who administered
10 that?

11 MS. HARTKOPF: It was through Stop Waste. But it
12 was ultimately overseen by the Energy Commission during
13 ARRA. I think the website's still there. I just don't
14 know that it's actively updated anymore.

15 MR. WEINSENMILLER: Yeah, I was going to ask
16 about energy update California. Does that help?

17 MS. HARTKOPF: It was energy --

18 MR. WEINSENMILLER: How could it help?

19 MS. HARTKOPF: But it was the multifamily page.
20 It was the multifamily landing page.

21 MR. RECHTSCHAFFEN: Can I ask a question about
22 the timing mismatch that all of you talked about. Is that
23 a function of the fact that budgets are provided on a
24 yearly basis or other program rules that say upgrades or
25 activity has to occur within a calendar year or both?

1 MR. DIRR: I would say both. So state-funded
2 programs are on a fiscal year basis and then the utility
3 programs historically have been on a calendar year basis.
4 I know that there's movement momentum towards the rowing
5 portfolio which I think will help alleviate that. I think
6 that's the intent.

7 So funding typically would be on a fiscal year or
8 calendar year basis but then also programmatically the
9 goals and targets would be on the same metric, the same
10 time scale. So really just things start happening when you
11 get to October, November, December and you try to figure
12 out, okay, is it going to make the deadline, do we roll it
13 into next year, do we try to complete it this year? And
14 once we close out those books especially on the utility
15 programs, you know, you have to do your quarterly reports
16 and then your final program, your wrap up, that's just for
17 the previous calendar year.

18 MS. HARTKOPF: I would agree with that.

19 MS. GUERRA: And I would also like to note that
20 many of these funding resources are very competitive so
21 there is the likelihood that we won't secure that funding
22 within that fiscal year. So sometimes we need that
23 flexibility to also allow to be participate in these other
24 programs and to carry on until that funding is secure.

25 MR. RECHTSCHAFFEN: And I have another one quick

1 last question.

2 Couple of you said we should target buildings at
3 time of acquisition or sale, but what is that specifically
4 mean for agencies running programs? What should we do?
5 Maybe you can talk about it in your comments but we all
6 know that but we don't know what -- how to facilitate, make
7 that happen, provide incentives. What's the best way to
8 really effectuate that?

9 MS. HARTKOPF: So I can -- this is a little bit
10 old experience but during ARRA, I was running a program in
11 Sacramento and I did a lot of outreach to major real estate
12 brokers in the area that were doing multifamily sales and
13 acquisitions. And building a relationship with them
14 resulted in a lot of projects come in because they would
15 basically talk to perspective owner or current owner and
16 say there's this program that can provide substantial
17 incentives for a retrofit. You're going to be making
18 upgrades to make this property ready to rent again and it
19 was -- it was a very effective way of driving
20 participation.

21 MR. DIRR: And I would add I think what is
22 exciting with AB 802 and the potential opportunities for
23 disclosing energy use is that that will hopefully make some
24 of those properties more attractive to prospective buyers.
25 So the more that we can make that information readily

1 available or even locally through local ordinances in
2 regards to when that disclosure happens could help drive
3 the market both for new purchaser acquisition or even at
4 the rental level for folks that want to move into
5 particular unit and know that their utility costs are going
6 to be lower than the building across the street.

7 MR. MCALLISTER: I want to get to this data issue
8 a little later, but I wanted to follow up on this
9 particular issue. So buying and selling, that's one big
10 transaction, but the rehab actually is also another big
11 transaction. I wonder if you could talk about how that
12 could be leveraged, you know, for buildings that don't
13 change hands, but just have an investment and a repackaging
14 going on, you know, that's only going to happen once or
15 twice between now and 2050 for most buildings. So it seems
16 like a good opportunity to leverage, but maybe you could
17 talk about how that might happen.

18 MS. MCGOVERN-GARCIA: Yeah, so in our experience,
19 it was the perfect combination of LIWP becoming available
20 in conjunction with the time frame that we were
21 resyndicating two of our buildings.

22 We went through and did kind of the normal suite
23 of what we thought were robust energy efficiency and how to
24 target budget to hit under the low-income housing tax
25 credit program. But then our AEA the TA provider under a

1 LIWP came in and really looked at it with a fine-tooth comb
2 and did a more in-depth analysis of if we increase the SEER
3 rating or the glazing on the windows, the expense would be
4 nominal but the energy efficiency yield would be larger.
5 And so having that TA while you're designing your suite of
6 rehab measures, because of the supplemental incentives
7 under LIWP, we took a normal project that would've, you
8 know, been energy efficient maybe at 15 percent or 20
9 percent under the tax credit program and were able to get
10 that up to 56 percent.

11 And so for us, it was the combination of the
12 technical assistance and site inspections, and that
13 feedback on what our options were at the right time in
14 conjunction with our rehab project. And I think really the
15 sweet spot is once 9 percent competitive low-income housing
16 tax credit projects get funded, they have 180 days to close
17 that and do project implementation, and that's when they're
18 really defining the final scope and the equipment specs and
19 those types of things, working with projects that are
20 funded through tax credits, through focused TA, I think is
21 what made it successful for us.

22 MS. STAMAS: And I just add in terms of, you
23 know, what can agencies do or how to help facilitate this,
24 I think one is having programs that are flexible and so
25 that they're able to adapt of maybe they don't have just a

1 packaged list of measures, but they can adapt based on the
2 technical assistance to an owner's project or at that time
3 of refinancing. And I think it again gets back to timing,
4 not to overlabor this, but if a program's only around one
5 year, then it's almost impossible to target a points of
6 major rehabs or refinancing because those projects take
7 longer than a year.

8 And then also, a free ridership. So if you are
9 targeting an owner at a time when they're taking out tax
10 credits, are the savings going to account or are they going
11 to be diminished? So, you can -- a lot of these times
12 where you're helping owners do a larger scope of project or
13 saved, you know, double the amount of energy they would
14 have saved, but how is that calculated and is it considered
15 that the programs didn't actually help the owner achieve
16 more savings or not. And so having some guarantees around
17 that so that program administrators feel confident that
18 they can provide that support to the owner, but not have
19 the savings be diminished, is helpful.

20 MS. HARTKOPF: And I also think vice versa, as
21 the states come out with programs, you know, look at what
22 programs are already out there and what their criteria are
23 and try not, you know, unless you have a strong reason to
24 try to align some of those criteria so that you're not
25 duplicating efforts.

1 As an example, you know, Tax Credit Allocation
2 Committee has worked over a number of years to their
3 sustainable building task group to develop the requirements
4 for the energy efficiency requirements for the tax credit
5 program to align as much as possible with the utility and
6 state programs that are out there. It's not to say there
7 aren't still nuances, but the intent at least is for those
8 requirements to aligned.

9 MS. SCOTT: Hi. I would -- I have a few questions
10 and thoughts here, as well. I just wanted to make note
11 that as the lead on transportation for the Energy
12 Commission as well, I'm really excited to hear about the
13 packaging of some of these housing improvements together
14 with the plug-in electric vehicles. I really like the
15 vision you laid out with the solar and the vehicles and the
16 van pools and the rideshares. I think kind of thinking
17 about this as a whole in that way is really nice. And then
18 on the flip side, we have to be careful that that doesn't
19 then overcomplicate it such that we kind of get wrapped
20 around the axle again. But I like thinking about that
21 together in this way.

22 I had a thought for you all as you put your
23 comments together, and thank you so much for your excellent
24 panel and bringing your expertise to us here today, and to
25 others who might want to provide comments to the

1 commission. I think that we identified some barriers that,
2 for example, like the definitions of units, so that it
3 makes it really hard to get smaller buildings that are
4 maybe four units or six units or eight units in size. We
5 talked a little bit about definitions for some of the
6 programs between a low-income community and a disadvantaged
7 community and how that sometimes cuts out communities that
8 we didn't mean to, that we actually are aiming for to
9 include in the program.

10 And I know a lot of that ties back to the goals
11 and the purposes of the various programs, and I'm just
12 trying to think about how do we get at that. And some of
13 that might require a statutory change, right, some of that
14 might require a change in the regulation that the agency
15 has developed to implement that. And so if you have, if
16 you can flag for us where some of those things are, and
17 just kind of make note of oh, gosh, this is going to need a
18 statutory change, this will require Energy Commission to
19 update a regulation, I think that will be really helpful
20 for us as we're kind of thinking about how do we really
21 jump in and put those solutions in place.

22 And then I had a question for you all about the
23 technical assistance, which I heard loud and clear of
24 course is very important. I'm thinking a little bit about
25 our Prop 39 program, which included some technical

1 assistance for the schools to be able to hire someone to
2 come and help and look around the school and see what is it
3 that's needed, and it's kind of the same theme, right? The
4 administrator of the school is a very busy person, he or
5 she may not have time to actually put together the
6 application. And that was included within the funding of
7 Prop 39. I'm wondering if of some of the technical
8 assistance programs that you highlighted, how are those
9 funded, or how would you envision us getting that technical
10 assistance component into our programs as we go forward?
11 That's a -- and so.

12 MR. PENNINGTON: So, could I amended that just a
13 teensy [sic]. So what makes LIWP a work for technical
14 assistance and the other programs not be like that?

15 MR. DIRR: LIWP as well as the barrier program
16 and the MC program where we kind of do similar models,
17 where the program implementation and the technical
18 assistance is wrapped into one, one-stop shop, essentially.
19 The technical assistance itself is included as part of the
20 administration budget of that particular program.

21 MS. STAMAS: And, I don't know if this
22 contributes or not, but LIWP isn't under the same cost
23 effectiveness test and have other, yeah, EM&B challenges.

24 MR. DIRR: Yeah, LIWP, because it's not
25 administered via the energy division, we have more

1 flexibility around the total resource costs test, not to
2 gross baseline electrification, those sorts of things that
3 allow it to be a really useful testing ground for programs
4 as a whole throughout the state.

5 MS. HARTKOPF: And then I -- I mean, I can speak
6 from the utility prospective without saying that I am a
7 utility representative. So with the caveat, most of those
8 programs have taken a third-party model, where we utilize
9 the existing Trade Ally Network that's serving tax credit
10 projects, for example, that are doing the energy audits for
11 tax credit programs, and they can submit the documentation
12 to the program. And they still receive a rigorous amount
13 of technical assistance, but the technical assistance is
14 definitely not as comprehensive in the sense that the
15 program implementer is not as engaged with doing the actual
16 audit, developing the recommendations, they're just there
17 to provide support and to augment what that third-party
18 Trade Ally is putting together.

19 And we could probably argue about which model
20 works better, but I see definite value in taking some of
21 the burden off of the owner and having them basically just
22 providing them with the recommendations rather than making
23 them go out to hire somebody to do those recommendations.
24 But, I'm going to -- I don't want to count on them that
25 specifically, because I see value of both models.

1 MS. STAMAS: I think also having a neutral and
2 trusted source for technical assistance, we've heard that a
3 lot from owners of being able to -- if program -- not that
4 programs are competing, but in some sense sometimes if the
5 goals aren't completely aligned or there's different
6 metrics and each program has to meet their separate goals,
7 then sometimes there is a certain amount of competition
8 between the programs. And so having a third party that can
9 say, this program is actually better for your needs or this
10 program, you know, actually won't work for you, but it
11 might work for someone else, but having someone that they
12 can trust is also kind of critical. So I imagine the prop
13 39 technical assistance is also kind of -- has that trust
14 component.

15 MS. SCOTT: Yeah, I mean, I was just thinking
16 about it in terms of kind of the potential zero sum game
17 that we may be playing where we've got programs that don't
18 have enough money, they get over subscribed and then they
19 end up with waitlists, but then the value of having had the
20 technical assistance. And I think maybe Vanessa, it was
21 you who mentioned that it's maybe \$50 to \$100 per unit in
22 one of the buildings that you studied. And how do we kind
23 of wrap our hands around, why you're really getting good
24 bang for the buck when you spend it in this way even though
25 if we end of with a cap, right, in the zero sum game, it's

1 still a really valuable investment in that space.

2 MS. HARTKOPF: Yeah, I would agree. I mean, if
3 we're still constrained by -- we're always going to be
4 constrained by budgets and timelines, we can improve those,
5 but having technical assistance throughout consistently
6 helps a little bit with the lack or the challenge against
7 momentum, because weightless stopping and starting programs
8 is incredibly detrimental to the market and it creates a
9 sense of apathy or just flat out, I don't want to do it
10 again because it was too painful the first time. Having
11 some consistent technical assistance throughout certainly
12 alleviates some of that, it doesn't solve it, though.

13 MR. MCALLISTER: Great. So I just have a couple
14 questions. I just want to congratulate all of you for the
15 incredible work that you do. You know, those of us that
16 have a little bit of background in low-income, I mean, we
17 know how many of the challenges you face, so it's really,
18 you know, way to go. And we want to help in any way that
19 makes sense, obviously, which is why we are here.

20 And also, you know, Nick clearly, Nick you've hit
21 a really, you know, AEA is hit a niche and obviously you're
22 really good at it. I mean, I think we need to ramp up
23 access to resources like yours, definitely.

24 So I guess I wanted to get back to Vanessa, you
25 mentioned the CUAC and how important it can be to access

1 better mortgage terms, higher limits on mortgages. That
2 seems like it's not a zero sum game, it's actually
3 liberating capital from the marketplace that otherwise
4 would not come to those projects. So I guess, also, you
5 know, Bill has a long history with this and I feel like
6 we're in a position to do something, if we can figure out
7 exactly what it is to get resources to the CUAC.

8 So, I guess, could you -- do you have anything
9 other -- can you drill in a little bit on that? Like what
10 you would recommend specifically for the CUAC, just make it
11 more accessible and updated it or is there more to it?

12 MS. GUERRA: Yeah, well I think the main thing is
13 making it more accessible, right? Because like I mentioned
14 before, the CUAC right now is only accessible for those
15 projects -- new construction projects that are using low-
16 income housing tax credits, right --

17 MR. MCALLISTER: Uh-huh.

18 MS. GUERRA: -- because the Tax Fair Allocation
19 Committee allows us to use that as the utility allowance
20 which essentially allows us to reconfigure our rents so
21 that we can have higher rents.

22 But, again, it's something that we can't use for
23 retrofits and again, I'm not quite clear on what the
24 rationale is for the Tax Fair Allocation Committee as why
25 they don't -- they prefer not to or they can't. And so I

1 think by having that on retrofits, again it gives us the
2 same flexibility that we have on new construction to be
3 able to leverage that additional funding that we need, or
4 financing that we need to help with those costs.

5 MR. MCALLISTER: I mean, I see this might be
6 related to the data issue that you brought up, but --

7 MS. MCGOVERN-GARCIA: Yeah, my understanding from
8 the Tax Credit Allocation Committee was that they didn't
9 have the expertise on staff to double check the
10 calculations that are required to go into the CUAC because
11 it is an engineered analysis of energy consumption that
12 generates the utility allowance. And so some of that they
13 were starting to farm out. But anytime you have a third-
14 party review of an item that's required under TCAC, it
15 extends their timelines, and so it was causing a
16 programmatic backlog to where they weren't able to make
17 their funding awards on time.

18 And so I think it's a conversation between one of
19 your entities and the Tax Credit Allocation Committee if
20 there were resources for an entity like AEA to come in and
21 review the CUAC modeling in a timely fashion so they could
22 stay on schedule for their awards, that would open up the
23 opportunity for more applicants to use that tool.

24 We had one scenario under new construction where
25 our utility allowances were \$104 a unit under the HUD

1 model, and with our energy efficiency, we were exceeding
2 Title 24 by 20 percent, and our solar, we were able to get
3 that down to about \$30 a unit and that allowed us to
4 leverage a \$500,000 per loan to bring into the project
5 which more than paid for the solar and the energy
6 efficiency upgrade. So, I think it's a matter of getting
7 that technical assistance to the Tax Credit Allocation
8 Committee.

9 MR. MCALLISTER: Okay. So I'm going to have that
10 as a takeaway, where we're going to -- we don't really have
11 time right now, but let's dig into that and convene a
12 little conversation to see what we can accomplish.

13 MS. HARTKOPF: And, I guess I would just add that
14 I'm happy to follow up with Bill on that, because we are
15 currently the technical assistance provider for TCAC, and
16 we have raised this retrofit issue as the next step. But
17 it's just -- it's, I don't, I think it's a budget issue,
18 and so, we'll follow up on that.

19 MR. PENNINGTON: Yeah, the tools designed for
20 newly constructed buildings --

21 MR. MCALLISTER: Yeah.

22 MR. PENNINGOTN: -- associated with NSHP, and
23 kind of ran out of resources to go the next step and look
24 at existing buildings.

25 MR. MCALLISTER: I'm sure there is -- there are

1 issues that, you know -- it is more complicated with
2 existing buildings, there's a lot of good data, you know,
3 and sort of -- there's a lot going on --

4 MR. PENNINGTON: Right.

5 MR. MCALLISTER: -- with respect to giving
6 certainty to the savings of an existing building --

7 MS. HARTKOPF: Yeah.

8 MR. MCALLISTER: -- project, so I think we could
9 leverage that. But I don't really want to finish -- we
10 don't have time to finish this conversation right now.

11 So I have a different question, sort of switching
12 gears. Do any of you work in POU service territories, and
13 if so, could you compare and contrast? Sort of a lot of
14 our discussions have been around the IOU, you know,
15 grandparent funded programs, but is there any special
16 consideration, or differences in the -- are there any
17 differences in the conversation with respect to POU's?

18 MS. HARTKOPF: Yeah, I can address that. So,
19 there's definitely much more flexibility with POU's and
20 they're not as driven by the same cost effectiveness and
21 typical evaluation concerns that you might see from an IOU.
22 But I think in general because they're smaller and also
23 their focus hasn't been as much in the multifamily retrofit
24 sector, at least not on comprehensive, they've always had
25 great programs for low-income and some sort of prescriptive

1 based menu rebates available.

2 I will say that I can say with certainty that
3 entities like SMUD who tend to often, you know, lead the
4 pack on energy-related issues are looking carefully at what
5 they can do for multifamily retrofit, and likely, we will
6 want to build something more off of an AB 802 benchmarking
7 based program rather than, you know, driving participation
8 just through audits and modeling. And hopefully, you know,
9 SMUD and other utilities for that matter, and of course,
10 I'm not SMUD, so I'm not speaking for SMUD, are more able
11 to provide the kind of data that Betsy is asking for
12 because they're not under necessarily the same constraints
13 as the IOUs are under.

14 And I think LADWP, I mean that's an area that
15 Maria can speak about that's -- they have a lot of
16 programs, they're just not necessarily focused on
17 multifamily.

18 MS. STAMAS: Yeah, that's what I was going to
19 bring up. And, you know, not being an expert on each
20 individual publicly owned utility service territory, I
21 think generally there's a lack of tailored programs for the
22 multifamily sector and so we're doing a deep dive and a
23 study on the market low-income housing market in Los
24 Angeles, and what we've found is that there's a lot of
25 available programs, but they're measure focused, so like a

1 refrigerator replacement program or a separate program for
2 toilet replacement and so on. And so not having kind of a
3 single multifamily intake or single multifamily program
4 that an owner can go to and have easy access to a package
5 of measures. So I think generally lack of tailored
6 programs for the multifamily sector.

7 MS. HARTKOPF: And we do have a -- I did see a
8 PUC representative today in the audience, so maybe they'll
9 come up and speak and provide that feedback.

10 MR. MCALLISTER: They would be welcome do to so.

11 MS. HARTKOPF: Yeah, I think Maria's point is
12 valid though, most of the POUs, you know, they have limited
13 budgets and limited number of programs they can offer.
14 Some multifamily typically falls either under their
15 commercial or residential or both. So, they address them
16 more on a custom basis.

17 Generally, I guess, that's something I can say
18 for sure, you know, all the POUs are much more open to
19 looking at individual projects, so if Vanessa were to come
20 forward the project and it's SMUD territory and say this is
21 what we're doing, you know, SMUD is much more likely to
22 come up with a custom incentive for them than to try to
23 roll out a program just because the scale isn't always
24 there.

25 MS. STAMAS: Right. And that has been our

1 experience here in SMUD. The only challenge that we have
2 faced in POU -- or SMUD territory, POU territory, is the
3 fact that we aren't able to gain that upfront capital or
4 incentive like we do in IOU territories for solar. So, you
5 know, in PG&E territory we're able to get huge incentives
6 through new solar homes program, but unfortunately that
7 isn't available in SMUD territory, so that's something
8 that's been holding us back from being able to do that.

9 In addition, I've attended several workshops in
10 the past about how we move forward in this territory to
11 produce more solar for multifamily. And what I've heard
12 from the utility company, SMUD, is that there's also
13 concern about having their existing infrastructure support
14 the type of virtual net metering type of setup that we
15 usually do with multifamily to take advantage of solar type
16 of incentives.

17 MR. WEISENMILLER: How about CCAs? Do they
18 provide any help in --

19 MR. DIRR: Yeah, MCE does, MCE is currently a
20 rate pair funded energy efficiency program, both from
21 multifamily under electricity and gas savings, and then
22 they're currently rolling out their low-income pilot, the
23 LIFT pilot, which spun out of the separate seating. But, I
24 think they're the only CCA currently that is administering
25 they're rate pair funded programs.

1 MS. STAMAS: The LIFT pilot looks to be really
2 innovative in terms of working with multiple efficiency
3 programs and combining budgets behind the scenes to create
4 a single package. The LIFT pilot by Marin Clean Energy.

5 MR. WEISENMILLER: Great. We'd like to -- would
6 thank the panel and thank you very much.

7 MR. MCALLISTER: Thank you.

8 MS. STAMAS: Thank you.

9 MS. RAITT: Thank you. So that's great. We'll
10 go ahead and -- thank you.

11 We'll go ahead and get setup for our next panel
12 discussion on regional service delivery and crosscutting
13 one-stop pilots. So, if our next panel could go ahead and
14 come up to the tables.

15 Okay, so we're taking a short break, we'll be
16 back in five minutes, I'm just letting folks on WebEx know
17 we're taking a short break. Back in 5 minutes. Thanks.

18 (Off the record at 11:32 a.m.)

19 (On the record at 11:38 a.m.)

20 MS. RAITT: Go ahead and get started. And folks,
21 go ahead and take your seats.

22 MR. WEISENMILLER: Okay, everyone, let's start
23 again. Encourage everyone at lunch to continue the
24 conversations, but we've got a lot of ground to cover
25 today. So let's roll.

1 MS. RAITT: Okay so for this panel. We have a
2 panel discussion on regional service delivery and
3 crosscutting one-stop pilots, one-stop shop pilots. Excuse
4 me. And Alana Mathews from Energy Commission is our
5 moderator.

6 Thanks, Alana.

7 MS. MATHEWS: Thank you, Heather. And I'm
8 waiting, yes, as we get our presentation up.

9 Welcome again. Glad to see that the first panel
10 went well. It generated a lot of discussion. So now we're
11 going to move on to our regional one-stop, our crosscutting
12 one-stop pilots.

13 So joining us for this panel are representatives
14 who have expertise from various perspectives including
15 clean energy program providers, program delivery,
16 organizations, online engagement, clean energy equity, and
17 program policy development in the realm of clean energy and
18 energy efficiency.

19 In alphabetical order, I'm going to introduce our
20 panelist. Starting with Andrew Dugowson. He's a program
21 manager in energy and environmental policy with Southern
22 California Edison. His role is, he's part of a team with
23 Edison focused on environmental justice for disadvantaged
24 communities and low-income communities. And his team works
25 both on individual proceedings but also have -- are engaged

1 in a broader effort of building partnerships and
2 incorporating environmental justice activities in the
3 regular course of business.

4 We have Sekita Grant. She is part of the
5 Greenlining Institute's Environmental Equity Team where she
6 works to make energy and climate policies in California
7 equitable and beneficial to communities of color. She
8 comes to Greenlining from Business for Social
9 Responsibility, a California nonprofit where she worked as
10 a climate and energy sustainability consultant to large
11 corporations. And prior to that, she was a policy advisor
12 here at the Energy Commission and served as lead advisor
13 for Chair Weisenmiller.

14 We also have Matt Perry who is the global
15 business director for DDB, a global communications group
16 with offices across the United States. Matt leads a team
17 in the DDB San Francisco office responsible for the
18 implementation of energy upgrade California which is a
19 statewide energy efficiency awareness and behavior change
20 strategy engaging Californian house holders and small
21 businesses.

22 Next, we have Jason Wimbley. Currently he is the
23 chief deputy director with the California Department of
24 Community Services and Development. Mr. Wimbley possesses
25 extensive experience in working with low-income

1 communities, utility companies, and community-based
2 organizations in an effort to better guide the
3 implementation of CSD's energy programs as well as to build
4 synergies existing between existing utility and local
5 government energy programs serving low-income communities
6 and individuals.

7 And last, but not least, we have Randall Winston
8 who is executive director of the California Strategic
9 Growth Counsel, a state agency that brings together
10 multiple agencies and departments that supports sustainable
11 communities emphasizing strong economies, social equity,
12 and environmental stewardship.

13 And I am Alana Mathews, the public advisor for
14 the California Energy Commission. And I was the initial
15 project manager for the Barrier Study. So in the role I
16 helped coordinate the research outline of issues and the
17 community meeting for the Barrier Study which you heard
18 Michael Sokol review in his presentation.

19 In those community meetings, a recurring concern
20 was this sense of being lost with clean energy information
21 by low-income customers. On the one hand, they've felt
22 there was a lot of information that they - that they had
23 that was out there that they didn't know about. And then
24 on the other hand, those that did know about it felt
25 overwhelmed by it.

1 And I do apologize. Next slide. So we
2 introduced our next slide.

3 So that concern when we had our technical
4 workshop, it was also reiterated by community business
5 based organizations as well as program providers. So in an
6 effort to resolve that concern or at least address it, we
7 had Recommendation Number 8 which was a development of the
8 one-stop shops. The state, in consultation with the Energy
9 Commission, CPU, CARB, CST, and others related stayed in
10 local agencies should establish a pilot program for
11 multiple regional one-stop shops to provide technical
12 assistance as we heard that's needed in a lot of instances
13 to develop these programs, targeted outreach and funding
14 services. And that will enable owners and tenants of low-
15 income housing across California to implement energy
16 efficiency, clean energy, zero admissions and near zero
17 emission transportation infrastructure and water efficient
18 upgrades in their buildings. So that's what our
19 Recommendation Number 8 is.

20 Next slide, please.

21 And as I mentioned, what the community members
22 share with us as well as the program providers and the
23 community-based organizations that partner with the program
24 providers really dialed into and said there is a need to
25 access that information. And more importantly to

1 streamline the access to information. But just as
2 important as streamlining the access is how we distribute
3 and package that information because we recognize the
4 diversity of California itself, but especially within our
5 low-income communities.

6 So we want to make sure that the one-stop shops
7 are not just streamlining access, but we wanted to look at
8 what is the structure that would ensure the regional one-
9 stops are responsive to community members and not just
10 accessible. So that's what we're going to kick off the
11 conversation with, and I'm going to turn it over first to
12 Sekita to ask her -- next slide please -- what would you
13 recommend as a model structure for regional service
14 delivery one-stop shops?

15 MS. GRANT: All right. Thank you. Thank you,
16 Alana, for inviting me to be on the panel.

17 I, first of all, I would like to say that I don't
18 think I could have selected a better starting lineup on the
19 dais to lead California through these conversations. So
20 I'm really excited to have all of you here to kind of guide
21 us and ensure that we're successful in reaching our goals
22 under these 350 studies.

23 So I'll go through some points. I can't say a
24 few because I've noticed that I have about six here but
25 I'll go through them briefly. So the most -- one of the

1 most important things is really about finding local
2 partners when we're looking at how to create a one-stop
3 shop model. So ensuring that you have a local partner that
4 is resourced to do this work and that you're operating
5 through that local partner. And these local partners
6 should have established relationships within communities
7 and establish channels of communication.

8 So this is really how we can ensure that we're
9 meeting communities where they are as opposed to kind of
10 creating some type of a separate model that communities
11 then have to adjust to. And what's going to happen is that
12 they're not going to adjust to it and it's going to be not
13 used or useful, the investments.

14 The second piece which is very related is that as
15 we're creating agenda -- an agenda for what each regional
16 one-stop shop will accomplish, this agenda has to be
17 community driven. So that means that the communities
18 have -- or are at the table and have a say in terms of what
19 the priority projects are within the scope of the one-stop
20 shop. They're deciding what the priority funding streams
21 and what the different outreach strategies are.

22 So really it's maybe kind of a governance issue
23 but ensuring that the communities are at the table in terms
24 of determining how the one-stop shop will be operated. And
25 I'll speak a little bit more to that later.

1 Another important piece, I think, as the state is
2 looking to do something that is inherently to be
3 successful, very regional and local, but doing it from kind
4 of this statewide lens is really about communication. And
5 really stressing the importance of multidirectional
6 communication. So that means both, you know, when you have
7 a regional technical assistance center that there is
8 effective by directional communication with the state so
9 it's not just top down. But, you know, there's a lot of
10 opportunity and there should be the ability for communities
11 to teach the state and to help us learn how we should be
12 operating our clean energy and climate programs. So that's
13 an important communication stream as well as across
14 regional centers so across host.

15 There's a lot to be learned, a lot of resources
16 that are going to come out of any investments to kind of
17 target technical assistance. And so I think the state
18 could play a very powerful role in terms of kind of
19 leveraging resources amongst different regional partners.

20 So the fourth thing and I didn't come up with
21 this term. Bricks and clicks is something that I think is
22 really cool. And so, you know, it's really just discussion
23 around are we looking at some type of a physical center
24 located within a community and/or are we looking at more of
25 an online presence? And I think, you know, my sense is

1 that both are needed. However, I want to add more
2 importantly, it has to be specific to the region. So some
3 regions might not want or need an actual brick and mortar
4 location for this. And we don't want to invest, it's
5 costly to have that space and then it not be used and
6 useful. And in some communities perhaps the online
7 presence isn't as important. So I think it becomes
8 important, you know, going back to earlier points around
9 communication, having a community-driven agenda then you
10 have a clear sense of, you know, depending on the region,
11 what is the best strategy when you're looking at bricks and
12 clicks.

13 The other big thing is tracking and transparency.
14 So really, you know, having, you know, understanding the
15 importance of having a baseline data and I know we're going
16 to talk a little bit more about indicators in this panel I
17 think later in the day. But really having, you know,
18 tracking data from, you know, what's happening with these
19 one-stop shops and just being transparent about it.

20 Which leads me to my last point which is that we
21 do not have to get this perfect right at the gate. I've
22 been spending more and more time in private sector
23 conversations in Silicon Valley, and the venture capital
24 world and e-startups, and folks have learned how to
25 commoditize failure. So I think that it's been kind of an

1 interesting experience but coming from also working at the
2 state, I think that there's room for the state to -- to be
3 maybe less conservative in some of these new projects. And
4 that there's opportunities to, you know, just it's about
5 starting small maybe, you know, starting with a few pilots
6 starting out. I think I'm a big fan of adaptive management
7 so as long as you have the data, you have the transparency
8 and we're always checking in. We can always make
9 adjustments moving forward to ensure that we're hitting our
10 targets. And I think that was a great point that was made
11 in the last panel.

12 Yeah, so I'll stop there. Those are some of the
13 criteria. I know other folks are going to bring in some
14 really great points and actual concrete examples of how
15 this can be successful.

16 MS. MATHEWS: That's a nice segue for Jason. If
17 you could share with us some concrete examples of what
18 CSD's regional delivery model and maybe some key lessons
19 that you've learned for success.

20 MR. WIMBLEY: Certainly. So CSD administers the
21 state's low-income weatherization program that was covered
22 extensively by the first panel. And then we also
23 administer the federal low-income home energy assistance
24 block grant. And the Department of Energy weatherization
25 the assistance program.

1 CSD traditionally works with community-based
2 organizations to carry out the administration of those
3 grants locally. And there are two examples of program
4 administration and service delivery that I believe
5 possesses the qualities that align with the one-stop
6 objectives of providing information and resources to low-
7 income communities.

8 The first one is the low-income weatherization
9 program multifamily program, that was covered extensively.
10 The department, you know, applied the learnings from our
11 first attempt the launching a multifamily program that
12 occurred with the stimulus funds that were received. And
13 even though we didn't achieve much success in being able to
14 provide those resources, you know, to the housing segment,
15 we applied the learnings from that program to basically
16 influence the design of the program that we have in
17 current -- in present day, at the present.

18 And through that experience, we have assembled a
19 state administrator that places a great deal of emphasis on
20 technical assistance which was a feature of the program
21 that was definitely embraced by the market and received
22 many kudos today. As well as we wanted the administrator
23 to be in the position to have at least conversant on all
24 the various programs, resources that are available to
25 multifamily to enable those funding resources to come

1 together to provide the most comprehensive form of
2 financing, you know, for multifamily building upgrades for
3 energy efficiency and solar.

4 So with -- with that model, we even right now
5 it's statewide -- it's not statewide, but it's focused on
6 disadvantaged communities and the program has been able to
7 enroll approximately 40 projects based on the amount of
8 funding that, you know, we currently have. It's identified
9 projects in 16 of the 29 counties that contain
10 disadvantaged communities. But you certainly can see that
11 this program is definitely scalable and can serve as a one-
12 stop for addressing the needs of multifamily. It's under
13 the current program design. Property owners can come to
14 one location to receive not only the valuable services that
15 an AEA and its team are able to, you know, able to provide.
16 But in addition, the property owner's needs can be best
17 served by having the resources that have been accumulated
18 by the AEA team to provide, you know, services to all
19 multifamily property owners, you know, throughout the
20 state.

21 As I mentioned before, I believe that the program
22 definitely is scalable, but for purposes of the one-stop
23 pilot recommendation, I think this multifamily program is
24 ideal and should be one that should be considered for a
25 pilot or a demonstration project going forward.

1 In addition, I believe that when you look at low-
2 income housing, you know, we have design strategies that
3 address the low-income housing segment of multifamily and
4 single family. And when you look at the single family, the
5 state's largest program resources that are available to
6 address single family, you know, housing needs are the
7 programs that CSD administer as well as the investor-owned
8 ESA program which is an energy savings assistance program.
9 And CSE has been engaged with the IOUs and CPC to look at
10 ways that we can build a stronger synergy and better
11 program coordination between those two programs.

12 And in -- and in 2014 CSD, CPC, and PG&E
13 conducted a pilot study, you know, to design, test, and
14 evaluate a joint weatherization program model to better
15 serve low-income customer energy needs. And this program
16 model sought to capitalize an administrator efficiency and
17 service improvements to low-income customers where the IOU
18 ESA program and CST weatherization programs are
19 administered by the same organization locally. And
20 generally speaking, in most cases, they operate independent
21 of one another in most areas.

22 And the advantages that you gain from that that
23 the dual administrators are advantaged by having access to
24 program databases systems that are trained and
25 knowledgeable on the various programs. And the best

1 position to leverage the resources in the way to, you know,
2 to improve the offerings to low-income customers. As well
3 as the loss for better utilization of the resources that
4 they have in their control.

5 When the -- even though the pilot was limited in
6 the scale and focus, it -- what it did identify that there
7 are definitely some benefits that can be gained when you
8 look at strategies of combining these resources to target
9 certain customer segments or geographic regional areas.
10 And that can result from the lining of benefits and
11 administration that occurred locally.

12 And since the objective of the one-stop is to
13 improve the delivery of information of resources to low-
14 income communities, I think the learnings from the
15 geographic coordination should illustrate the potential for
16 this, you know, administration model to be possibly
17 considered for a pilot going forward.

18 In addition, advantages that we identified
19 through this method of local administration is that it
20 provided, you know, opportunities to streamline access to
21 the programs. So currently understanding that these two
22 programs are distinct and separate, individuals that need
23 to access those programs have to apply to each program to
24 receive the benefits and offerings that those programs have
25 to offer. You know, with this dual administration model

1 that we tested in this pilot, you know, there was a single
2 intake where an individual applied, you know, at one time
3 and was able to receive the full benefits and offerings
4 that these programs could deliver on.

5 In addition, there was benefits in how
6 efficiencies gained in the delivery of services in the
7 sense that we could control and limit the number of visits
8 to a home, to a target property to deliver the offerings of
9 these programs. And understanding that the ESA and the
10 federal weatherization programs serve as the state's
11 largest program resources for improving energy efficiency
12 of low-income housing, I think the designs for the one-stop
13 shop should, you know, build this into the fact these
14 resources into the equation as we go forward, we're looking
15 at potential models and designs.

16 MS. MATHEWS: Andrew, I know you're going to talk
17 about Valley Clean Air Now a little bit later, but did you
18 have another program that could possibly shed some light on
19 a regional model that's been successful with SCE?

20 MR. DUGOWSON: Absolutely. First, I'd like to
21 say thank you for both hosting this workshop and for the
22 opportunity in the invitation to speak. Really appreciate
23 it.

24 This is a very important topic to Edison. I know
25 this is understood but worth repeating. I think 50 percent

1 of the disadvantage communities within California lie
2 within our service territory. Of our residential
3 customers, I believe 40 percent either reside within a
4 disadvantaged community or are on an income qualified rate.
5 And so developing a sustainable scalable solution is
6 necessary both to reach our climate goals, but also to
7 ensure as Commissioner Rechtschaffen said that we can
8 prepare and manage affordability for our customers moving
9 forward.

10 And finally one more prefatory response, remark
11 before I get to your question. In thinking about what a
12 one-stop shop means, it's -- we think of it not as like a
13 single topic but rather as a collection of heterogeneous
14 approaches kind of under this broad umbrella of
15 streamline -- of coordinating different programs both
16 within the utility and then also coordinating with other
17 outside programs. And then also this access targeted
18 outreach, and I like that term responsiveness.

19 So I can give two quick examples. The first, and
20 I mention now disadvantaged communities. I'm about to talk
21 about Irvine. There's the Irvine Ranch Water District.
22 We've worked with a combination of SoCal Gas, SCE, and
23 Edison Gas, Irvine Ranch Water District, to develop a
24 common combined one-stop shop for residents in that local
25 area. It's an online portal people can fill in basic

1 information about where they live, whether they have a
2 pool -- a pool, pool pump, basic information about their
3 residence. And based on that survey, a contractor will be
4 sent out to their house trained in all of these programs
5 and can administer, implement all of those services at
6 once. And so this is a model that is very locally tailored
7 to these services and it has a single contractor trained in
8 multiple services which can really streamline access and
9 create some efficiencies there of building off of what
10 Jason said.

11 If you don't mind if we have a sec, I'd like to
12 contrast this to the actually Valley Clean Air Now approach
13 because I think it builds on this, but if we're constrained
14 for time I can punt it till later.

15 MS. MATHEWS: Sure.

16 MR. DUGOWSON: So there's this second
17 organization with whom we are really happy to partner.
18 It's an organization called Valley Clean Air Now. The
19 administrator for the Enhanced Fleet Modernization Program
20 in the San Joaquin valley. This -- they have a flagship
21 program called Tune in and Tune Out which travels up and
22 down the San Joaquin valley. And, excuse me, will run an
23 event on the weekend where customers who have a -- can
24 receive a free smog check or indicative smog check. And
25 customers who fail that smog check if they're income

1 qualified can receive a voucher for repairs to reduce the
2 emissions that come from their vehicle.

3 So you're asking why Edison's interested in this.
4 Well there's a small swath of their territory that overlaps
5 with our customers. But what's important here is this
6 series of events consistently brings out 500 customers who
7 are really interested in both cleaning up their car but
8 also prepared to receive services, so there's this group or
9 pool of customers who are already very likely eligible for
10 many of the services we can provide. And so Edison can
11 travel out to these events, enroll customers and care. And
12 also we've brought out one of our contractors who provides
13 acts of services and also certified for several state
14 services as well.

15 And so building off this excellent events and
16 establish an in-community outreach much like Sekita has
17 talked about, we can work and build off of these events to
18 really target and have a high retention. And, what's the
19 word, many people will take the programs. I don't have a
20 word for that.

21 And so I want to contrast these two and really
22 highlight the point that Sekita made which is these are two
23 different programs, that are very regionally tailored, but
24 they both rely on having this clear idea of what services
25 the customer can receive and then also having this

1 technology or screen to understand what services the
2 customer's eligible for. I think those both are
3 instrumental for the success of the programs.

4 MS. MATHEWS: Thank you. So that is definitely
5 reiterating kind of how we want to have this comprehensive
6 approach. And as mentioned earlier about bricks and
7 clicks, that's looking at a brick and mortar building but
8 also that online presence.

9 So, Matt, I'd like you to share a little bit for
10 us about how this model can have effective online
11 engagement. Especially since we know that a lot of low-
12 income customers the way they're going to access the
13 digital world is through their telephone. So when we even
14 think about online engagement, we need to think about a
15 platform that is accessible from a mobile device.

16 MR. PERRY: Yeah, thank you very much for the
17 opportunity to speak today as well.

18 I think the starting point from my perspective is
19 that Energy Upgrade California is a statewide campaign
20 which is a little different to some of the regional
21 campaigns that some of you are working on. It does talk to
22 all Californians so again we have multiple audiences that
23 we need to connect with and engage with. So that sort of
24 if you'd like means that we need to develop a broad message
25 both in advertising terms but also we need to build digital

1 platforms, social media platforms, et cetera, that can talk
2 to multiple audiences in an effective way.

3 However, low-income audiences hard to reach are
4 absolutely top of mind and critical components to our
5 strategy. Was -- we're in early days as well so we've -- I
6 think the campaign is, the new campaign that we've just
7 relaunched has went live less than a month ago so
8 unfortunately I don't have lots of data to share with you
9 today.

10 But I did take a dipstick look at, sort of a
11 snapshot look at what's been happening so far. And it's
12 interesting actually in social media particularly what we
13 see is, what we're seeing at least and we need to drill
14 into this, is that low-income, by that, I mean, you know,
15 people on less than 40,000, 30,000, 25,000 dollars as
16 defined by their online profiles actually overindexes in
17 some of the data that we're seeing from the outbound paid
18 media in social channels. So it's kind of interesting that
19 low-income people potentially are reflected in some of the
20 successes that we're seeing early on.

21 Now we have to be careful because of see young
22 people are also often lower income people. That said, I
23 look at age profiles as well and interestingly older people
24 overindex in the social results. So it says interesting
25 that we sort of think that maybe potentially digital

1 channels may be not necessarily the most effective at
2 giving to these hard to reach audiences or potentially low-
3 income audiences. But it looks like, you know, the world
4 is shifted to the point now where this technology and these
5 platforms are now accessible by many.

6 Taking a step back is what I thought it would be
7 just worth referencing some of the work that we did in our
8 last segmentation of our sort of California-wide audience.
9 And so we found in that the attitudes towards energy
10 efficiency and energy behavior wasn't really defined by
11 income or political allegiance or geography. There are
12 actually those things really cut across all of our segments
13 we ended up identifying five core segments that flowed from
14 highly active, highly engaged people all the way through to
15 people who are a little more skeptical. But it didn't
16 really matter whether you are low income or high income,
17 your attitude towards energy actually is really determined
18 by other factors. So your willingness to create an outcome
19 for the greater good versus your willingness to create an
20 outcome for your back pocket. And so really those are the
21 kind of the two defining kind of attributes or
22 characteristics or motivations for the California
23 population when it comes to energy efficiency.

24 So, again, I think that gives us lots of room to
25 play in many communications and we talked a little bit

1 earlier on about joining up communications with activations
2 on the ground. I think there's a lot of work to be done,
3 not just looking at sort of digital versus the real world,
4 or online and offline, but actually a much more integrated
5 approach so that where CSE may be doing something with a
6 local community, how can Energy Upgrade California
7 integrate into that or work with you in a cohesive way? I
8 think if we look at it from the holistic perspective we'll
9 have a better outcome.

10 MS. MATHEWS: I think that an integrated approach
11 is key for some of our remote communities as well. And I
12 do notice on their website the Energy Upgrade California
13 there are multiple languages on their website and that's a
14 good example of how we want to be inclusive in our programs
15 and responsive to the community.

16 Next slide or next question.

17 We're going to move to the second segment of the
18 panel which is to discuss how can we best leverage funding
19 and coordinate statewide low-income disadvantaged community
20 reaching our outreach activities. I think the examples,
21 Jason, that you provided were very informative of how we
22 can expand services as well as maybe offset costs when
23 we're able to do that.

24 So I'm going to turn to you first. Again, if you
25 can share a little bit more about the existing programs and

1 how we can leverage that to achieve those two goals.

2 MR. WIMBLEY: So under CST's programs as I
3 previously mentioned, we work exclusively with profit and
4 nonprofit and public community-based organizations. And
5 like most community-based organizations, these
6 organizations tend to be multifaceted and offer a broader
7 range of social and economic services that could be made
8 available to low-income and disadvantaged clients.

9 And strategies that we've incorporated into our
10 program to build upon the capabilities of these
11 organizations include improve workforce development and
12 objectives where by leveraging the relationships that these
13 organizations have with workforce development boards,
14 financial resources and partnerships to provide an array of
15 job training and education and employment services for low-
16 income individuals and disadvantaged residents is a
17 leverage feature of our programs. You know, now we're just
18 not focused on energy, we're focused on some of these
19 complimentary benefits that can be gained from services.

20 In addition, we leverage our federal resources
21 and utility and rebates and incentives to look at ways that
22 we can offset the costs for energy improvements. And in
23 some cases, we look at directing our federal dollars that
24 may have a little bit more flexibility to address the
25 health, comfort, and safety needs that are kind of a

1 component part of improving the energy efficiency of low-
2 income housing.

3 In addition, we place a strategic focus on
4 leveraging utility rebates for solar. Where we know that
5 these are generous rebates but oftentimes there is a
6 financial divide, you know, that's or a gap that most low-
7 income individuals face that they can't take the incentives
8 and combine it with resources to acquire the solar systems,
9 so we use our dollars as bridge funds, you know, to make,
10 you know, to complete the financing and provide
11 opportunities for low-income communities and individuals to
12 gain the advantages of renewable energy.

13 Also, would like to emphasize that in some of
14 our -- in many cases, the community-based organizations
15 that we work with are also involved in important social
16 service programs like TANF, Cal Works, WIC, which in many
17 cases individuals, low-income individuals that come to our
18 program for assistance, generally are, you know, looking to
19 have their home weatherized. You know, they're usually
20 dealing with a more pressing financial crisis in their home
21 whether their utility bills have been disconnected or their
22 utility services have been disconnected, they're having
23 difficulty paying their utility bills or there's some other
24 crisis in the home and they're reaching out to these
25 organizations to, you know, to acquire services and

1 assistance. And through that interaction with that client,
2 they discover that there's a need for energy services and
3 some other, you know, social service benefits that they can
4 provide and they take the opportunity to do that.

5 And then also something that was probably wasn't
6 emphasized enough in our -- in the first panel discussion
7 with the LIWP program, but it's -- this is a component part
8 of the technical assistance, and that is we definitely try
9 to encourage property owners and, you know, to look at all
10 funding sources, resources that are available to them and
11 to utilize those resources, you know, to make the energy
12 efficiency improvements to their buildings. And as a
13 result, we have seen projects that, you know, have received
14 significant upgrades, you know, and involve a diverse
15 financing mechanisms or diverse funding, you know, funding
16 sources to contribute to these projects.

17 The benefits of that is that it allows us, you
18 know, to extend the use of our cap and trade investments,
19 you know, to do more projects. And, you know, without
20 those funding resources, we know coming from other areas,
21 we definitely would have had probably a more limited output
22 of projects that we would have experienced or accomplished
23 with the program.

24 MS. MATHEWS: And, Randall, can you just chime in
25 and talk about the leveraging of multiple or the components

1 and partnership with the transformative climate
2 communities?

3 MR. WINSTON: Sure. And thank you again, Alana,
4 for inviting me to the panel. And to the panel.

5 So SGC just by way of the quick introduction
6 administers a number of the state's cap and trade programs,
7 focus on affordable housing and transit, land, agriculture,
8 and conservation. And then more recently, kind of a suite
9 of new programs. First a pilot effort offering technical
10 assistance to disadvantaged communities for affordable
11 housing and transit program. And then new cross GGRF
12 program-wide technical assistance program. And then as
13 Alana mentioned, a new program looking to invest in a much
14 more integrated fashion in the most disadvantaged parts of
15 California, called transformative climate communities.

16 We've been kind of thinking through I think this
17 issue both of leveraging funding opportunities and tying
18 together the variety of technical assistance efforts for
19 some time. I wanted to maybe just touch upon three things
20 in response to your question. One, on this pilot TA
21 program effort lessons learned that we're bringing now to a
22 DGF program-wide technical assistance effort and then more
23 specifically on transformative climate communities. So at
24 a high level just over the past year for our housing,
25 affordable housing and transit program, our technical

1 assistance project -- pilot, excuse me, was regional
2 focusing in on Southern California, the Central Valley and
3 the Bay Area, and just with about 60 of the disadvantage
4 community applicants who were unsuccessful in the first
5 round.

6 I mention it because it is sort of -- we sort of
7 put together a format for how we approached the type of
8 assistance that we were offering to applicants. One on
9 partnership development, so the types of entities including
10 developers, local governments, community-based
11 organizations, financing entities who are applying for our
12 affordable housing and transit program. Two, project
13 development. So when you're talking about a specific
14 project and the components that that would entail a bit
15 more technical in nature. And then finally, direct
16 technical assistance. So when you have an entity ready to
17 apply to a program, conducting the GHE quantification and
18 other elements.

19 Now we're bringing that to assist effort across
20 the various DGF administering agencies including CSD's
21 program and working closely with Jason on that. And we're
22 finding that it's definitely challenging. It is much more
23 difficult to be able to, from the perspective of programs
24 run by different departments with different applications
25 processes and different ways of engaging with communities

1 to piece all of that together. And I think that's why it's
2 important and really thankful for the conversation that
3 we're having now.

4 Now at TCC, Transformative Climate Communities,
5 we're letting multi-stakeholder teams really define a
6 vision for transformation. That will include a place-based
7 approach rather than a programmatic approach. So rather
8 than being a little bit proscriptive around what we're
9 asking for from specific projects, allowing communities and
10 stakeholders on the ground to define what those projects
11 are that in turn meet our state's climate goals. We've got
12 \$140 million for that program looking to invest in, again,
13 the most disadvantaged parts of the state, Fresno and Los
14 Angeles and a third community that we'll still determine.

15 One thing directly I think by way of leveraging
16 funds is in specifically this effort, is requiring it. So
17 we do require at least in our advice guidelines now for the
18 program a 50 percent match for the funds that will be
19 granted to the awardees. But with that, we recognize that
20 substantial technical assistance and support will be
21 needed. We're talking about the most, again, the most
22 disadvantaged parts of the state. And so we really are
23 drawing from the lessons that I mentioned in the earlier --
24 the earlier points.

25 So a few things specifically out of TCC that

1 we're honing in on by way of leveraging funding. As you
2 could imagine, there's a host of existing efforts already
3 underway in these places with regard to foundations, other
4 community-based organizations looking at ways to better
5 assist communities on the ground. We formed a roundtable
6 with foundations across the state that includes specific
7 technical assistance and support opportunities that build
8 off of their effort. And that's sort of parallel to that
9 kind of tripartite components that I listed earlier on
10 partnership and project development and technical
11 assistance.

12 Specifically with workforce development and
13 training, we're looking to partner with California
14 community colleges, specifically with Fresno Community
15 College first to partner or sorry to pilot a workforce
16 development component that would link career technical
17 education, pre-apprenticeship and apprenticeship programs
18 to whomever would and to be available to whomever would be
19 the recipient of the grantee both from Fresno and L.A.

20 And then finally with financing, working directly
21 with the infrastructure bank and the treasurer's office to
22 also make available financing mechanisms focused on
23 infrastructure and community solar. And, again, we're
24 intending to sort of bake these directly into the
25 guidelines for our program and so it's not just the case

1 that we want to, you know, award funds to entities and walk
2 away. But through the life of the, you know, 70 million or
3 \$35 million investment five to ten years be able to work
4 with those recipients. And in order to ensure we get the
5 most -- the most bang for our buck out of the invested --
6 investment that we make.

7 So I'll stop there.

8 MS. MATHEWS: Are there any recent developments
9 that any of you are aware of in existing programs or
10 proposed programs that would help inform these efforts
11 specifically to leverage funding?

12 MR. WIMBLEY: I can speak to most recently the
13 department would -- we issued an RFP to initiate the launch
14 of our Phase II for our, you know, LIWP weatherization
15 program. And in that solicitation, you know, we, you know,
16 we were intentional in ensuring that we put some strategic
17 emphasis in, you know, in critical areas.

18 One of those areas, you know, where there are
19 several areas but I'll touch on -- I'll touch on those now.
20 You know, one is on the workforce development. We wanted
21 to make sure that for the funding opportunities that we're
22 making available, that organizations could come forward
23 with strong plans and objectives for workforce development.
24 So, again, many of these proposals that we received outline
25 different strategies for how they could accomplish that.

1 In some cases they were performing direct hires or they
2 impose requirements on subcontractors to, you know, to hire
3 from local communities, as well as they were forming
4 relationships or leveraging existing relationships
5 workforce investment boards and other federal training
6 programs to provide training and employment opportunities,
7 you know, to -- to individuals.

8 In addition, the cap and trade dollars has some
9 limitations on its use and that the dollars are
10 specifically, you know, earmarked for, you know, with GHE
11 reduction. So when you look at weatherization, we
12 understand that, you know, in many stakeholder meetings
13 that we had that weatherization means a lot more than just
14 energy to low-income individuals in their communities. You
15 know, they want to ensure that we had workforce
16 development. We also make sure that we address all of the
17 housing needs that are identified in the course of
18 delivering services.

19 And then -- and then many cases these
20 organizations had, you know, responded on putting together
21 resource plans or cumulating resources that could be
22 positioned to address the variety of needs that come along,
23 that go along with energy. For example, Rooftop Solar, it
24 seems like it's a perfect solution when you have the money
25 and the funding available to install a rooftop system, but

1 in many cases, homes that we encounter have dilapidated
2 roofs and you need resources, you know, to make those roof
3 repairs in order for the solar systems to be installed.

4 So organizations have come forward with, you
5 know, strategies on how to provide, you know, major, you
6 know, home innovations or repair to allow energy efficiency
7 and renewable energy investments to take hold.

8 In addition, there are other issues that we
9 encounter in running into homes, you know, where homes that
10 have environmental hazards, you know, attach them whether
11 it's, you know, lead-based paint, or mold remediation or
12 whatnot. And rather than just deferring those homes, you
13 know, these organizations are really looking at ways to
14 address those needs and using other resources so these
15 homes can receive the benefits of energy efficiency
16 upgrades and solar. So those are just a couple of
17 strategies.

18 MS. MATHEWS: Thank you. So we're going to have
19 one last question that I just like you all to address very
20 briefly so that we can have time for a little bit for the
21 day as to ask questions.

22 Next slide please.

23 If we can talk about metrics very quickly. So
24 we've talked about what the model structure should look
25 like. How we can leverage funds to create this model for

1 one-stop shop. But lastly, just if you can share maybe one
2 metric that you think is key for us to ensure that we
3 maintain the success and measure our success for these one-
4 stop shops.

5 MR. WIMBLEY: So for the one-stop shops, we've
6 talked about, you know, what the objectives of the one-
7 stop, you know, shop for to serve. And, for me, I think
8 there are three items that we need to track. One is the
9 ability, you know, the partnerships that these regional
10 one-stops can represent and bring to the regional
11 communities to best address the regional needs. Two, it's
12 looking at the availing of resources that these regional
13 one-stop shops can amass and provide to the local community
14 to address their various needs.

15 And then also there should be metrics to measure
16 the reach that these regional one-stops have in serving the
17 community. And, you know, and then within those
18 communities, there could be, you know, specific targets
19 that we may want to emphasize given resources and
20 opportunity. But there should be metrics to evaluate the
21 performance and the ability of those regional one-stops to,
22 you know, hit those marks.

23 MS. MATHEWS: And, Sekita, I know that you
24 probably have some metrics.

25 MS. GRANT: Yeah. So I think, you know, the

1 Energy Commission, LADWP, there's already been some really
2 great work digging into looking in to these equity
3 indicators and metrics. I want to -- I just want to make
4 the point that there is, I think, room for there to be a
5 regionalized approach to the -- to creating metrics. We
6 should have regions and communities defining what success
7 looks like for them. So understating there's going to be
8 some common across the board, across the state metrics, but
9 there all should be -- also should be opportunities for
10 states to really kind of hone in on what the full suite of
11 metrics looks like in their region. So, I guess I've got
12 to pick one. Is that -- okay.

13 MS. MATHEWS: Two.

14 MS. GRANT: I guess I -- I mean, I think the jobs
15 pieces we're looking at broader economic impacts, looking
16 at access to job training and to actual access to jobs
17 themselves is really important.

18 Could I make a point on the last question?

19 MS. MATHEWS: Go ahead.

20 MS. GRANT: Okay. So I just wanted to say really
21 quickly on the financing, I think the state has an
22 opportunity to somewhat show our cards right now with
23 what's moving with clean energy investments. And there's a
24 lot of uncertainty in the capital but I think there's a lot
25 of -- there are a lot of programs that are very certain.

1 And so to attract that private capital to have the state be
2 very clear and transparent about what's moving, kind of
3 create a one-stop shop I guess for the private sector to
4 see what's moving in terms of clean energy investments and
5 bring them to the table and have them respond and identify
6 opportunities to co-finance and participate in the market.

7 MR. WINSTON: So we're also at SGC developing a
8 host of indicators and metrics for transformative climate
9 communities and working with a staffer at the CEC,
10 Mr. Corey's staff over at ARB and co-benefits. But if I
11 just had one to add, I actually would throw in leadership
12 development.

13 MS. MATHEWS: Which would fall under community
14 capacity development.

15 All right. Matt, did you have any metrics for
16 how we can measure our effective online engagement?

17 MR. PERRY: There's multiple measures, obviously,
18 online. We've defined two metrics that we want to keep a
19 close eye on with most objectives underneath each one. The
20 first is awareness obviously because we're in the
21 essentially in the communication game. So we need to build
22 awareness of our program and build awareness of the
23 messages within that program. And then critically
24 important is intention, so the ability to survey our
25 audience and see how we're shifting people's intention to

1 take action on energy efficiency is the other kind of key
2 metric that we're focusing on and we'll be tracking over
3 the next few years.

4 MS. MATHEWS: Thank you. With that, I'll turn it
5 over to the chair.

6 MR. WEISENMILLER: Yes. I want to thank everyone
7 for participating this afternoon.

8 I think the thing I'm struggling with is this
9 recommendation really came out from what we heard from the
10 community is that first of all, all of us have our little
11 programs and obviously people are trying not to say here is
12 this ASH or here is the ARFVTP event, but something which
13 really pulls it all together. And at the same time, people
14 looking for, you know, credibility in the community. You
15 know, in terms of who were they -- who were they really
16 going to listen to when someone says, yeah, you should
17 participate in this program. Probably not going to be
18 state bureaucrat frankly.

19 So, again, how do we move forward and this has to
20 be crosscutting in a way because it's going to take a lot
21 to pull this off. But, you know, it's like we have to pull
22 on which should, you know, just all these programs into
23 something that really works. And at the same time, I was
24 really interested meeting with Ron Nichols when he was
25 saying 40 percent that, you know, that disadvantaged

1 communities in the Edison service territory. So that seems
2 like ground zero to really focus this sort of activity at
3 least on a pilot effort activity launching.

4 So looking for people's ideas of how do we really
5 start moving this along? Where's the funding source? You
6 know, where do, you know, what should be the priorities on
7 location, you know, in terms of really getting this going
8 and the types of communities groups who really need to
9 engage with?

10 MS. GRANT: Yeah, I think you're pointing to some
11 really great kind of challenges and opportunities. I think
12 one thing I go back to is that we can -- I feel very
13 comfortable with and I think that we can start small so we
14 can identify, you know, what are the priority areas and do
15 the legwork to build the partnerships to work within the
16 communities to understand priorities. And I think, you
17 know, building in a good, you know, understanding of the
18 data and baseline data and also, you know, carrying a
19 principle around adaptive management so that we can make
20 changes moving forward. But I think starting small is key.

21 And in terms of funding -- yeah, I'm in the
22 capital lot. We're working on that, too, but I think again
23 it becomes, I think we're all working really hard to bring
24 in other sources of capital other than GGRF and to look
25 how -- look at how without, you know, giving too much

1 heartburn to folks but how to be effectively rate pair
2 money and how to effectively leverage federal funds and
3 private funding as well. I think there's a lot of untapped
4 private funding out there.

5 I was recently at an event where I was with some
6 folks that are in the venture capital world, there's a lot
7 of private funding there for technology and they were blown
8 away when I was presenting on all the great programs that
9 the state has invested in, they had no idea that this state
10 was -- when California is all in on something, that's a big
11 deal, you know, for the private sector. I don't think
12 people realize how all in we are. So I think there's some
13 opportunity there on the funding side.

14 MR. RECHTSCHAFFEN: Maybe Sekita or Randall,
15 what's the right size affordable housing sustainable
16 communities was regionally, your TA was regionally focused.
17 Sekita, you talked about having a community driven if we're
18 starting a few of these I guess part of it depends if it's
19 bricks or clicks. If it's -- if it's virtual, it may be
20 easier to do it statewide, but what should we do?

21 MR. WINSTON: So maybe I can start with that and
22 Sekita, feel free to add on.

23 So, you know, we -- we had as you mentioned
24 through our technical assistance pilot a focus on just
25 three reasons but really using Cal Enviro screen and kind

1 of the what we -- where we knew to be the greatest cluster
2 of the most disadvantaged communities as a starting point.
3 We work with entities who had a regional reach. So in
4 Southern California, that was the Southern California
5 Association of Governments. And the Central Valley, that
6 was the San Joaquin council of governments. And then the
7 Bay Area, that was ELP advisors and they in turn
8 subcontracted with community-based organizations who had
9 more specific expertise. And those really seemed as a
10 pilot fact by way of example.

11 I want to throw out just another example and kind
12 of an ethic apparel effort underway right now that has a
13 lot of similarities with this concept and that's
14 legislation that Senator Leyva has authored 263 looking to
15 establish climate assistance centers. Again, in a model
16 that shares a lot of similarities with the recommendation
17 here. That legislation points to ten regional centers. I
18 think that that might be a bit too many if we were sort of
19 just pilot effort, that's just my opinion, but I think
20 anywhere between three to five as an initial effort I do
21 kind of would echo Sekita's point on making sure we get
22 kind of the fine-tuning of regional differences right. The
23 Central Valley is not the, you know, the southern coast,
24 which is not the [indiscernible] each share, I think,
25 specific chall -- or have different challenges that would

1 be worth I think taking some time, really thinking,
2 thinking through both in terms of just what actually funded
3 and more importantly approach from the community or
4 community-based organizations who make up the, you know,
5 let's say regional -- regional-based organization.

6 If you want to add.

7 MS. GRANT: No, that sounds right. I think maybe
8 I'd add just really starting with the communities we're
9 seeing or the regions we're seeing the least adoption rates
10 we're seeing, you know, the least capital flow to them, the
11 least amount of participation in these programs that we
12 want to see scaled. And start there.

13 I mean, in terms of size, you know, it's hard to
14 call it because, you know, part of this is really going to
15 be dictated by what funding is available and where it comes
16 from. And that, you know, that money's -- you know,
17 wherever it comes from might have restrictions but I think
18 really starting with those communities that, you know, we
19 haven't been successful in reaching to date. And again, I
20 think, you know, ideally you have within maybe an initial
21 three, you have some diversity within those areas. So
22 maybe see what can move in the suburb -- or excuse me,
23 urban contacts versus rural.

24 But, yeah, I think these are important questions
25 to ask and there's opportunity for us to kind of start

1 small with it and really target those areas that have not
2 been reached with these programs.

3 MR. WEISENMILLER: Andrew, what's your sense on
4 how many centers you would need in the Edison service
5 territory to make this work?

6 MR. DUGOWSON: So the first question is we have
7 regional focus or centers, what -- what are we trying to
8 accomplish with the physical center too. We have one of
9 the points I wanted to bring up with the illustrating the
10 online shop versus the events that travel throughout a
11 territory is maybe something that's a traveling event
12 allows us to target or be more adaptive in reaching out to
13 specific locations, where the online event is available to
14 a service territory.

15 So this is kind of a roundabout way of saying I'm
16 not sure but I think that as we want to be crystal clear
17 about what we want to do with the regional physical
18 location and see which alternative to pilot as well.

19 MR. WEISENMILLER: Does Edison start billing
20 centers in the community? Does Edison still have community
21 billing centers? Payment centers?

22 MR. DUGOWSON: I believe we have several. I'll
23 confirm that and submit that in our comments but I don't
24 want to --

25 MR. WEISENMILLER: Yeah, I was just trying to

1 figure out they could become at least a brick broader
2 stuff.

3 MR. DUGOWSON: It's a good point. Thank you.

4 [Inaudible comment from the audience]

5 MR. DUGOWSON: Thank you.

6 MS. SCOTT: Yeah, I like the -- the, Andrew, the
7 valley can example that you came up with and I'm wondering
8 if there are other organizations and events like that that
9 are already kind of out there that are ongoing where people
10 are open to the idea of not just transportation but energy
11 efficiency, renewable energy that we could -- and not
12 now -- that we could brainstorm together that you guys
13 could provide for us in your comments so that in some
14 places we're not recreating the wheel, there might just be
15 a perfect place to jump on and say hey, can we talk about
16 this also.

17 So I thought that was an intriguing example that
18 you highlighted for us and I'll bet that there are some
19 really good ones like that around the state.

20 MR. DUGOWSON: And I would love to partner, so
21 anyone who would like to join us, please reach out to us.

22 MS. MATHEWS: The resource of the community
23 action networks, I know CSD you all work with them and
24 perhaps we can even expand it to schools and churches and
25 the networks that they have outside of just energy

1 efficiency programs to reach those hard to reach or those
2 who have not been participating in programs.

3 MR. COREY: I had a follow-up question. I think
4 it's for Mr. Winston.

5 It's -- I'm really intrigued by the
6 transformative climate community. I just think that sounds
7 like a platform. My real question, though, is is it a
8 platform for integrating some of the range of programs that
9 we were just talking about. It's really the chair, the
10 question Chair Weisenmiller asked. So was, I'm interested
11 in the -- at the status implementation just an example kind
12 of projects that you're seeing --

13 MR. WINSTON: Uh-huh.

14 MR. COREY: -- and the degree of even
15 oversubscription. I'm just trying to get a sense of is
16 this really going to present an opportunity to link some of
17 these issues that we're talking about here.

18 MR. WINSTON: So. Great question. Thank you for
19 the question, Mr. Corey.

20 I'd say yes, I do think that, you know, TCC could
21 serve as a platform for integrating not just our pro --
22 some of these programs we've been talking about but I think
23 some of the outreach efforts.

24 I want to, though, maybe touch a little bit
25 squarely upon one of the challenges to providing technical

1 assistance and capacity building. You know, and this is
2 stating the obvious, but when you're, you know, talking
3 about providing assistance in low-income disadvantaged
4 communities where you have historical disadvantage and, you
5 know, entities that openly disagree, local governments,
6 community-based organizations, then it really calls into
7 question, okay, what's the role of the state in such a
8 center and navigating, you know, deep-seated historical
9 issues that, you know, we're coming in at it right from a
10 certain perspective and, you know, kind of launching in the
11 midst of what's maybe divisions that have taken place for
12 some time.

13 But let me offer a specific example to your
14 question. So Fresno is a great example where just in the
15 past eight or so months that the TCC has been kind of
16 approved and we've been developing the program, we've seen
17 a tremendous amount of entities, foundations, private
18 institutions, of course the city government come forth and
19 trying to build bridges between I think -- divisions
20 between downtown north Fresno, southwest, west Fresno where
21 you've got, you know, very real concerns around communities
22 who've felt left out in some of the growth that's happened
23 there. So we are directly taking part and helping to
24 bridge some of those gaps.

25 Again, in Fresno they formed a 30-member steering

1 committee some of the local elected officials there and
2 entities who, you know, are representative each of the
3 parts of the city. Now we aren't -- we aren't preselecting
4 any winners, it's going to be a competitive process, but I
5 actually think even before the selection of projects and
6 rather than just sort of saying assistance as sort of okay,
7 let's give assistance to give essentially a handout for --
8 and that's maybe not being fair, a fair term, but just
9 showing folks how to apply. We're really finding ourselves
10 engaged in process design. What is a collaborative
11 stakeholder process look like in forming a much more
12 holistic vision for community?

13 And I think outreach and the assistance actually
14 could be put in that light. So it's not just about the
15 single one off projects but it's sort of let's just take a
16 step back and architect the structure. I'm talking about
17 direct memorandum of understanding between community groups
18 and government institutions and other entities to map out
19 the life of investments, climate investments and other
20 investments to achieve, you know, the climate outcomes that
21 we want to achieve.

22 And the state I think absolutely has a role to
23 play in that when you're talking about, you know,
24 communities where you have such levels with historic
25 disadvantage.

1 I'm not sure if that's getting at your question,
2 but I do think that it's -- it's been promising.

3 MS. GUZMAN ACEVES: Thank you. You know, looking
4 at some of our statewide goals and hearing, it seems like
5 there's a couple of pieces that were kind of maybe need a
6 little more focus on. One is really thinking through more
7 intentionally around transportation electrification where
8 that's kind of been.

9 We don't have as much historical community
10 organizations that like have the historical programs like
11 LIHEAP and all of that that we got to catch up on that end.
12 And some of our more robust programs are not community
13 oriented.

14 So I think it'd be good to kind of focus adhere
15 attention to and, you know, everyone obviously has a role
16 to play in that, the applications that are before us and
17 really yielding some benefit with this concept of
18 coordination amongst different entities and regionally
19 focusing them.

20 And I would just say for when we look at one area
21 of investing in disadvantaged communities and we look at
22 the other area which we've talked a little less about which
23 is alleviation of pollution and where that intersection
24 lies, may have to have a little more state-driven data at
25 least to inform the communities of -- it's perhaps there

1 are certain regions where more high-end investments,
2 certain types of transportation, electrification should be
3 a real priority. I mean, there really are areas of the
4 state where maybe we should be piloting things first.

5 And interestingly also, on the generation side,
6 you know, we're hitting this point where we saw a really
7 high number I think it was like 87 percent this past week
8 where -- 85 of GHG free AGHG free grid. And what we --
9 perhaps there's a regional focus to really look at where,
10 you know, that fossil fuel is still being generated and
11 where the local generation in disadvantaged communities
12 will have an even greater benefit. And perhaps the
13 question is should we focus really focus on that as a pilot
14 versus, you know, community solar that certainly is greater
15 than 85 percent but, you know, maybe not because they're
16 still off the -- they're still dependent on the grid, the
17 other part of the knife.

18 So just for things for us to think about in terms
19 of, you know, pooling resources to really maximize also the
20 pollution alleviation side and definitely there's no loss
21 in investing across the board but is there that additional
22 co-benefit.

23 MS. GRANT: Thank you, Commissioner. I think,
24 yeah, those are great points.

25 And two things that come to mind, the first is

1 kind of this, you know, theme around meeting people where
2 they are in the communities and the health concerns are
3 critical and so as you were speaking, I'm recalling as, you
4 know, participating Environmental Justice Advisory
5 Committee with the Air Resources Board and we have a lot of
6 community meetings that are really centered around health,
7 around pollution. And every -- and I've been in the
8 transportation, I lead the transportation group throughout
9 those meetings and there's also folks asking about electric
10 vehicles and charging stations. These issues are linked
11 for folks to access to the clean technologies as well as
12 the pollution that's burning their community. So I think,
13 yeah, I think that's absolutely correct that as we're, you
14 know, moving forward these conversations that we keep that
15 top of mind.

16 And another thing that came to mind in terms of
17 where we're kind of focusing this technical assistance that
18 there's an added benefit as well kind of in this
19 conversation around just transitions to the extent that
20 we're looking to reduce pollution in areas, we're looking
21 to possibly in some cases scale down production of things
22 in certain areas in order to reduce that pollution, what
23 are the economic -- what are the industries that remain,
24 are creating jobs and access to economic benefits within
25 those same communities. And to the extent that we're more

1 intentional, I think in bringing clean energy markets into
2 more heavily polluted communities, I think is just, yeah,
3 just to double tap, I think it's a strategy that we should
4 be keeping the top of our mind.

5 MR. WEISENMILLER: Great. Done now.

6 MS. RAITT: Okay. So I think we're going to take
7 our break. We'll be back at 1:30. Okay. Back at 1:30.

8 MR. WEISENMILLER: Great. Thanks.

9 (Off the record at 12:45 p.m.)

10 (On the record at 1:35 p.m.)

11 MS. RAITT: This afternoon we're starting with
12 two presentations on better use of data to benefit
13 low-income customers. And first is Pam Doughman from the
14 Energy Commission.

15 MS. DOUGHMAN: Hi. So, my name is Pamela
16 Doughman. I'm an advisor to Chair Weisenmiller, and we
17 have recently posted online a draft staff paper presenting
18 some ideas for framework and indicators to measure our
19 progress implementing the Barriers Report.

20 So, this framework -- this report presents a
21 framework and a set of indicators, and the framework
22 discusses objectives basically rolling up the
23 recommendations in the barrier study to three key
24 objectives: to expand access, increase investment, and
25 improve resiliency.

1 And by access, we mean expand access to product
2 selection, good jobs, small business contracting
3 opportunities, and nondebt financing.

4 By increasing investment, we mean increasing
5 investment in buildings, research demonstrations,
6 infrastructure, emergency preparedness, and capacity
7 building.

8 By resiliency, we mean improving energy
9 reliability, energy affordability, health and safety.

10 And as was mentioned in some of the earlier panels
11 today, it's very important to recognize local conditions
12 and priorities affect challenges facing communities and
13 these differ across California. So, this draft set of
14 indicators includes geospatial indicators, including
15 regional economic dynamics, climate zones including climate
16 change, different risks related to climate change, based on
17 geographic location, population density, whether we're
18 talking about rural or urban community, local resources,
19 public health, whether the community already is facing
20 environmental stressors, air quality challenges, and also
21 CalEnviroScreen, whether communities in a disadvantage --
22 as designated as a disadvantage community by the
23 CalEnviroScreen.

24 So, there initially we have proposed a set of 12
25 draft indicators and these are performance indicators.

1 Starting with -- I've got the indicator listed on the left,
2 and then how each indicator contributes to the objective,
3 whether it's the access, investment resiliency objective.

4 So, we have energy savings, the number of households
5 and small businesses served, renewable energy, small
6 business contracts, workforce and small business
7 development, jobs including the number and quality, and job
8 access. And, then, the indicators, five through seven, are
9 measures of capacity building -- that investment incapacity
10 building. And, then, we have the amount invested by a
11 building owner -- building owner and others, the outage
12 duration, energy affordability, as measured by the
13 electricity bills, proportion of income, health and safety
14 issues abated, and critical facilities with resilient
15 self-generation. Meaning that if the power goes out in the
16 surrounding area, the renewable energy that's located at
17 the critical facility, will continue to generate.

18 And these are an initial set of ideas to help spark
19 further conversation about how can we leverage existing
20 indicators to measure our progress towards achieving the
21 recommendations in the SB50 Barriers Report.

22 So, how can these indicators be revised to
23 improve measurement of clean energy access, investment and
24 resiliency for California's low income communities and
25 disadvantage communities? How can these indicators best

1 leverage existing equity indicators and data, which agency
2 organization, or program administrator should take the lead
3 for each indicator? And how can local priorities be most
4 effectively integrated into these indicators?

5 So, with that, I'd like to turn the microphone
6 over to John Chen from Los Angeles Department of Water and
7 Power.

8 MS. RAITT: Next is John Chen from the Los
9 Angeles Department of Water and Power.

10 MR. CHEN: Good afternoon, chairman and
11 commissioner. Thank you very much for the opportunity to
12 present at this workshop. Today I'm going to talk about
13 equity that Department of Water and Power has developed
14 during the past year.

15 In August of 2016, the Department of Water and
16 Power commissioners, with the support of our general
17 manager, has approved a resolution which established Los
18 Angeles Department of Water and Powers equity matrix daily
19 initiative. And our commissioner, Bill Thunderberg,
20 (phonetic) was spearheading and leading that effort.

21 And the purpose and the goal of the indicators
22 are to provide policymakers, program managers, with data to
23 access how well program services resource investment are
24 distributed and utilized. For the equity matrix, there are
25 four core categories that was established. We spent about

1 six months in conducting outreach events to solicit inputs
2 from community and business stakeholders. After several
3 rounds of feedback and revisions, we came up with 15
4 matrixes which are, again, here under the four-category:
5 infrastructure, customer incentive programs, procurement,
6 and employment. Many of those equity indicators are
7 mentioned in the framework. So today I'm going to show you
8 some of the matrix that was established and also the lesson
9 learned implementing those equity matrix.

10 One of the things mentioned in the framework was
11 the SADE, to track it, the SADE. We did that too. When we
12 initially started looking at the CDC the reliability, power
13 reliability numbers. The information we had was for six
14 district because that's how we tracking internally. The
15 data was quite interesting. We find out, for example, like
16 the West L.A., even though it's a nice area, but the
17 reliability was not as good as we thought.

18 But that's just one example how we would be able
19 to -- we are able to visually see the, I guess, reliability
20 throughout the City of Los Angeles. But the committee
21 members, especially council members, had mentioned to us
22 that this is a great chart. However, we don't know what
23 really is happening in our area. The area, geographic area
24 that's covered is too large. So, we said, okay, let's
25 examine the possibility of narrowing down to census track.

1 This is what we did in the course of about three, four
2 months with the assistance of a lot of the programmers.
3 And we were able to identify the city number for each of
4 the census track areas.

5 In order to accomplish that, we increase our data
6 gathering points from 10,000 to over 1 million data points.
7 So that's the magnitude of effort that has been put to
8 drawdown to a more detail level.

9 A lot has talked about the CalEnviroScreen. We
10 actually took that, the poverty level map, and we duplicate
11 it and we use as a background to some of our matrixes. So,
12 for example, low-income program, you know, on the back is
13 the low-income area distribution with the different color
14 codes, and we also show what's the participation level for
15 those areas on this particular map.

16 To be able to show the program, you know, with
17 some visual assistance is been very helpful. For example,
18 the rain barrel water tank rebate. As you can all see,
19 there's some pockets of concentration of rebates that's
20 been distributed.

21 So, that begs the question next is: why is all
22 concentrated on those area? Was it because the marketing
23 effort, was it because of the economic conditions, or were
24 there other factors that determine. So, you ask us to
25 basically explore more and looking to more how can we do

1 better with this program.

2 So far, I've mentioned a couple of issues. It's
3 always quite easy on the surface to try to map those
4 informations. But as we dove deeper, we ran into some
5 issues. For example, the [indiscernible] data, you know,
6 from 10K to 1 million that's one example for the city. But
7 addresses, even between the city, county, UPS, USPS the
8 addresses not really consistent all the time. So, when you
9 try to geocode it, it may give you a lot of error rate.

10 Early in the morning a lot, you know, has been
11 talked about the multifamily housing, the four unit versus
12 the five units or higher. So, the question comes:
13 who really has the data for all the buildings that has the
14 accurate apartment numbers? Is it Bureau and Safety, is it
15 Bureau and Engineering, or is it Housing Department, or is
16 it Department of Water and Power, or is it everyone is
17 doing their thing and should we get together and really
18 compare notes and maybe save some efforts. So, that's the
19 type of question when you come down to the ground level
20 that we're faced with.

21 So, I'll just give you a little flavor of what we
22 have encountered. And I'm sure as, you know, as the
23 framework gets implemented many of you may be faced with
24 the same issues.

25 Community Solar. We have -- sorry, it should be

1 2000 to 2015. This is a chart showing the per capita solar
2 incentive receipt for residential customers. As you can
3 see from this chart on the left-hand, upper-hand, that's
4 the valley, it's very hot in the summer, there's a lot of
5 rebates probably given to those areas. But at the same
6 time, you can also see there's pockets, especially down
7 south, East L.A. side of it, all the way down to San Pedro,
8 Wilmington on the bottom of the chart, there's a lot more
9 that can be done to provide the incentives to those
10 communities.

11 So, the program managers are looking at it. It's
12 not the only criteria for giving out the incentives, but we
13 think it should be one of the many criteria should be
14 considered for all programs.

15 Same thing, electric vehicle. This is a graph of
16 all the rebates that were given on electric vehicle from
17 2011 to 2016. I think the graph is very telling because
18 there's a gap. There's a gap onto the, you know, certain
19 section of the map where it's not very well covered. And I
20 believe just recently our board has met asking what would
21 it take to increase the amount of actual rebate that we
22 have given out by five times, and how can we distribute it
23 so that all areas will be able to receive equitably across
24 the board.

25 So, all this graph is very fascinating, it's

1 pretty to look at, and it's great for the community for
2 transparency wise. However, internally in order to have
3 this as a long-term engagement for the institutions, we
4 need to make sure that there's a lot of buying within the
5 company too.

6 So, this dashboard is really targeted for the
7 operating managers. So, on this there are four or five
8 section basically describe the background purpose,
9 achievement milestones, performance, there's target, so how
10 you're doing against a target, and then there's a
11 mitigation plan or recommendations.

12 On top, we have clearly identified the
13 responsible manager. As a matter of fact, you can see the
14 signature of that responsible manager, they have to sign it
15 when they submit this report. And we have a very clear
16 definition of what this matrix is for and we identify
17 exactly the source of the data so that nobody else comes in
18 and just decides to change the data.

19 For all the programs that we're pushing out, we
20 are asking people to identify the qualifying criteria on
21 this one page chart. The other thing, a lot of talking
22 about how do you market? How do you do the outreach work?
23 So, we ask them, the managers common area to talk about
24 what's in marketing channel? What's your ultimate goal?
25 And then sometimes you may have the information; sometimes

1 you don't. What is the penetration level on target market?

2 And for a lot of infrastructure, a transformer
3 and other things, you may not have a penetration level but
4 you have a replacement cycle time. So, if the, let's say,
5 we do 5,000 replacement transformers. Is that a good
6 number or is bad number? It depends. It depends if you
7 just have 100,000 transformers to replace versus a million.

8 So, this is another chart for the cable. And
9 earlier I talk about, you know, the purpose of equity
10 matrix is really just adding one component to the various
11 criteria we look at in prioritization -- to prioritize our
12 work. For example, for the mainline replacement, right
13 here, you can see there are at least eight different
14 criteria already existing. Leaks, material, pressure, age,
15 diameter, elevation, soil, collusiveness, hillside. Those
16 are all the things that they already looking at. But by
17 looking at the map, we can see, you know, how -- where's
18 the most trouble areas are. And you can vaguely see the
19 blue lines, those are the lines that we -- indicates what
20 we will be doing for the next three years in terms of
21 mainline replacement projects.

22 This is another one for the dashboard. This is
23 an example of, I guess, a rebate program, this is our
24 commercial direct install program. It has been very
25 successful for the Los Angeles area [indiscernible] for the

1 past probably ten years. We basically go to a small
2 business, go do assessment on their needs, and then as
3 integrate approach we just go ahead and replace whatever is
4 necessary in terms of water conservation or energy
5 efficiency. In this graph, it shows the zip code, the
6 number of cases we've done for that zip code, but at the
7 same time we can easily convert that into dollars. How
8 much the program dollars has been invested in those zip
9 code? Or we can do, you know, if it's not business, if
10 it's, let's say, residential program, we can easily
11 identify the per capita that's been received for those
12 areas. Those have been called out for by the framework.
13 So, this is just an example of one of the things that we
14 have already been doing.

15 So, lastly. So, what we talked about is the
16 external maps and the internal dashboard to make it
17 complete. We talk about dollar versus number. One of the
18 other things that we have triggered since almost a year we
19 started this effort. We started an audit of our process,
20 the internal and external audit. We're asking third party
21 to audit our entire, I guess, process of generating those
22 matrixes. So, we want to make sure that, you know, those
23 data source are accurate, the methodology are uniform
24 across the board. And because we possibly can be
25 publishing this information on annual basis.

1 Data format. There's so much data. Try to
2 recreate from scratch it will take you years to get it
3 done. Many of them I don't think there is a system you can
4 just automatically pull information from. Some of them
5 involve spreadsheets still. But, I think, the key goal is
6 that get something going and, you know, we'll try to
7 automate everything. But a lot of times, I would say
8 majority of times you cannot automate because it's still
9 labor process.

10 Frequency of data collection. We don't actually
11 report this information on a monthly basis. We report on
12 quarterly basis and semi-annually to a board to reallocate.
13 But we collect the data on a monthly basis because we want
14 everyone getting into habit of submitting the information
15 and the senior management team actually have meetings every
16 month to go through those numbers, to go through those
17 charts. So, it's a very engaged process.

18 The system platform. We are currently using the
19 Oracle business intelligence platform as well as the Esri
20 software.

21 So that's the conclusion of my presentation. Any
22 questions?

23 Thank you very much.

24 MR. WEISENMILER: I was just going to ask the
25 type of community involvement you had in development under

1 these?

2 MR. CHEN: So, we actually held a, I think it was
3 at least two or three events at our office. We invited
4 each, I think, outreach event we had over 70 people from
5 various organizations. Some of those organizations are
6 testifying here, earlier in the day. We talk to them. We
7 have private meetings with them also. And we setup e-mail
8 account that people can just submit information, their
9 questions onto the specific e-mail account. So that it's a
10 process we went through for almost six months before we
11 decided what to present finally, you know, getting approval
12 from the board.

13 MR. RECHTSCHAFFEN: I was going to suggest to Pam
14 for the indicators that you're drafting and working on.
15 One nice thing about LAWP's approach is they have it
16 broken -- the matrix broken down to specific programs as
17 well and not just at high level, like renewables or energy
18 savings. I don't know if we're considering -- I think it
19 might be worthwhile for us to do something similar. Look at
20 zero emission vehicle rebates or households participating,
21 that received incentive under the California Solar
22 Initiative Project or Net Energy Metering so we can get it
23 at that program level as well.

24 MS. DOUGHMAN: Yes, that's what we had in mind
25 but then we wanted to roll up the programs to a higher

1 level but have both levels of information.

2 MR. CHEN: Thank you, again.

3 MR. MCALLISTER: I just had one more question
4 actually. So, are you, I guess, what's the analytical kind
5 of eco system that you've put together for this? Are you
6 using people out there in the community, UCLA or others or
7 is it really all this happening in-house at DWP or what is
8 the nuts and bolts of this execution here to put together
9 this resource?

10 MR. CHEN: Fortunately, we have a lot a
11 institutions, academic institutions in the area. We have
12 engaged at least with a couple of them to help us assist in
13 providing additional information or suggestion. We also
14 have RP that's going out pretty soon to select partner --
15 select academic institution partner to help us to review
16 some of our internal data to make it robust. For example,
17 you can increase some of the planning department
18 information, the demographics, other crime stats, there's a
19 lot of things that added to this. So, this is only the
20 beginning. We have the geo map that's the first phase. The
21 second phase is the dashboard, so it makes it more
22 complete, then on top of that there's overlay of background
23 maps. The mayor's office has already -- they have a hub
24 called GeoHub. They took that information and published it
25 in, you know, via Esri into the website. So, people can go

1 in and play with it. They can create their own maps,
2 underlay additional information on top of it.

3 So, the whole point is that we just wanted to
4 push the data out and let the community use the data for
5 their own purposes and they have already done some of that.

6 MS. ACEVES: At what level is the dashboard
7 implemented at? Is that, you know, just managers doing
8 that on a monthly or how many folks do you have actually
9 utilizing that?

10 MR. CHEN: I think initially, I think, it look a
11 while for people to understand the importance of it and we
12 had to kind of just ask. Because a lot of people now very
13 much involved, from the manager to all the people that
14 provided data. I'm sure the manager also is also using the
15 information to have the meeting with the staff to make sure
16 that certain goals are met.

17 Because if you look at the -- for example, look
18 at this chart, there's blue and there's green. But there
19 are times where it can become red and yellow. So, when
20 that happens the manager not only reporting that but also
21 getting together with the staff, talk about how do we share
22 resources, how do we get additional contract.

23 So, I think it's a top -- but it's been used
24 companywide now. So, the entire company -- maybe we have
25 about 60 of those matrix, 60, 70. But that encompasses

1 every major operation of initial active that we have at the
2 Department of Water and Power.

3 MR. WEISENMILLER: As you were setting this up,
4 did you know -- did you see if any other utilities in the
5 country have this type of [indiscernible]?

6 MR. CHEN: I think I -- I just came back from
7 D.C. conference. I see a lot of people using data for
8 various things. But in terms of equity matrix, no, I have
9 not seen any.

10 MR. WEISENMILLER: Okay. Thanks.

11 MS. RAITT: Thank you. So, we'll move on to our
12 panel on strategies for Clean Energy Labor and Workforce
13 Development. So, if the panelist could go ahead and take
14 seats at the tables in the front here.

15 And the moderator is Sara White from the
16 California Workforce Development Board.

17 MS. WHITE: Well, good afternoon everyone. This
18 is a little bit of a weird setup because I'm facing you and
19 talking to commissioners and the panel is over there. So,
20 we'll try and pull it all together.

21 I'm Sara White. I'm the deputy director for
22 equity climate jobs at the California Workforce Development
23 Board and the labor agencies point person on energy and
24 equity.

25 Thanks so much for having us this afternoon and

1 having a panel that I think will be useful and enlightening
2 for everyone. My job here today really is to remind
3 everyone of what the workforce recommendations are that are
4 in the barrier studies. So, I'll throw up a couple of
5 slides on that and then run a panel discussion on people
6 who are thinking and working about these issues on the
7 ground. But before that I'm going to talk for about ten
8 minutes just to give you a sort of high level framework on
9 how workforce development can actually deliver equity
10 because it's not guaranteed. All right. We call for jobs,
11 we call for training, but you have to do this very
12 intentionally to get the outcomes you want. So, we'll talk
13 a little bit about what's important for that.

14 Let's see. So, today my understanding was that
15 we're talking primarily about the energy commission
16 recommendations. But I put both of them up here because it
17 seems to me that certainly in the workforce, jobs and
18 training area, we are talking about the same set of issues
19 and we need a workforce strategy that addresses these
20 simultaneously. All right.

21 So, I'm not going to read to you this all. I
22 threw up some of the language from the studies so that we
23 can go back and refer to it if people want to do that
24 during the course of the conversation. Both sets, both the
25 transportation and the energy recommendations organized by

1 the CEC on the one hand and CARB in the other, hope to
2 maximize economic opportunity for disadvantage communities;
3 right? And the CEC ones, a little bit more process
4 oriented. they define a process for implementation planning
5 that involves the board and a lot of state agencies and a
6 lot of partners in the field. And the CARB at this point
7 calls for similar expansion of quality jobs and access to
8 training.

9 If we -- I want to just quickly run through this
10 specific recommendations that are in the barrier study.
11 For the CEC, on the energy side, there's four of them. The
12 first is a workforce fund that will expand jobs and
13 training in disadvantage communities across the state along
14 with clean energy investments. This is, I think, critical
15 because the barriers studies, both part A and B, call for
16 expanded access to jobs and training, that it's necessary
17 and it's also very expensive. So, having some financing
18 mechanism, I think, is incredibly important.

19 The second is about attaching labor standards to
20 incentive programs and the procurement process. The third
21 is community workforce agreements, and we will talk about
22 these again during our discussion. And the fourth is to
23 integrate IOU programming with the main workforce
24 development system to kind of standardize our training
25 systems in the state.

1 On the transportation side, these recommendations
2 are echoed, not quite so specific, but calling for, again,
3 first of all elevating projects that deliver jobs to
4 disadvantage communities, and second expanding access to
5 training pipelines, career pathways. So, I think we're
6 looking at the same set of goals with slightly different
7 implementation efforts.

8 This is the technical part. This is my little
9 green job slide. And I brought this in here because I
10 think it's worth reminding folks about this vocabulary.
11 I've heard the term green jobs creeping its way back into
12 the collective vocabulary in California and, in fact,
13 across the country. And I just wanted a quick reminder of
14 the things we've learned over the last decade about green
15 jobs. And this slide is because I think, you know, back in
16 2008, 2009 people were talking about green jobs like it was
17 little green men from mars that were going to deliver this
18 exotic new species of wonder to the planet from somewhere
19 else. But as we know, this is not those jobs, the jobs
20 that we're talking about are for the most part traditional
21 industries and traditional occupations. Some of them new
22 for sure but mostly traditional and with new and evolving
23 skill sets but within industries that we know and talk
24 about. So, I -- it's important to restate that even though
25 it's obvious because I think thinking otherwise skews our

1 implementation. It changes what we invest in and it changes
2 what we promise to people. And I think we need to be really
3 clear about what jobs we're talking about.

4 So, these green jobs are great jobs, they're not
5 some futuristic wild kind of job. They're highly
6 technical. My example on this is that, you know, everyone
7 that I know is all excited about self-driving cars; right?
8 But the job that delivers and embodies the equity promise
9 of the clean energy economy more than any other is probably
10 bus drivers; right? We call them coach operators, coach
11 mechanics, also light rail mechanics and operators. These
12 are the jobs of the future. These are the clean energy
13 jobs and these are jobs that deliver equity to disadvantage
14 communities in all kinds of ways through mass transit. So
15 just think about that for a second. And we will talk about
16 that when we are in discussion.

17 I also want to think at this point just to hang a
18 lantern on the series of related initiatives that are going
19 on right now dealing with the same jobs and the same
20 economic framework. So not just 350 but AB 118
21 Investments, Prop 39 Investments, SB1 Investments that are
22 going to start putting 5 million a year, every year into
23 transportation upgrades, so. And there's many, many others
24 of these. But each of these to some extent is premised on
25 the idea that they'll be new demand for workers and we need

1 to create a skilled workforce to meet it. And in many of
2 these cases the emphasis is rightly on connecting
3 disadvantage communities to economic opportunity in the
4 form of these jobs and training.

5 That is great news. I am pleased to see that but
6 I want to emphasize that this does not require a whole
7 series of separate training programs and training
8 investments; right? Training investment, yes, but we need
9 to build on what works. Construction and manufacturing
10 pipelines, for example, look the same; right? At least at
11 the entry level. So, just keep in mind with that.

12 So that brings me to my next sort of background
13 point is just to remind people that we really need to start
14 with the jobs. There are -- there's a vast array of clean
15 energy jobs, of course, across all sectors certainly the
16 renewables and energy efficiency sectors that we're talking
17 about and in transportation.

18 But the point is to start with what the jobs are
19 then you figure out what the skills you need to do those
20 jobs and the credentials and then you build pathways for
21 low-income Californians, other folks in disadvantage
22 communities with lower skill sets. How do you get them
23 prepared for those jobs and skills? And this is what, you
24 know, sort of pre-apprenticeship and [indiscernible] basic
25 education do.

1 But I think the instinct for everyone, and
2 certainly for people who don't live and breathe workforce,
3 is to start with the training; right? You want to start in
4 the community. You want to start with the communities
5 we're targeting and say, like, let's train a lot of people.
6 But training does not create jobs, it does not guarantee
7 employment, and it is agnostic to job quality. So, I just
8 want to hang that out there. Of course, we need it and we
9 need access to it and we need investment in it but just
10 remember what it can and cannot do. And I think the first
11 commandment of workforce development is really know thy
12 labor market; right? So, this is one reason that we'll see
13 a lot of emphasis in this work on apprenticeship and
14 pre-apprenticeship because this -- that is a system that
15 navigates that intersection between supply and demand in
16 the labor market that almost nothing else does.

17 So, the big thing here is that you need to
18 connect, again, supply and demand in the labor market,
19 which, I remind folks is very different from supply and
20 demand in the energy market, and we can talk a little bit
21 later about what that means. But just as hope -- just as
22 hope to create quality jobs won't create quality jobs but
23 you have to put standards on employers. So, you can't
24 create a bunch of training programs and hope that it
25 transforms a community; right? We need to do this

1 intentionally and simultaneously.

2 So, I will also say, I was going to talk a little
3 bit about matrix now, but since we just had a presentation
4 on that and there is an entire paper now written on that I
5 have a slide at the end that is sort of our thoughts on how
6 to update the workforce matrix, but I think we'll leave
7 that aside for now.

8 I want to move quickly to the one other slide
9 that is the slide that explains all of the things and
10 this -- oh, I forgot to do this. I'm getting ahead of
11 myself because I only have 10 minutes. So, let me just
12 back up to say the piece about the jobs. What the jobs
13 look like. About four years ago I worked with the US
14 Department of Energy to identify the top 40 emission
15 critical jobs in the American solar energy market; right?
16 And a lot of them -- my slides aren't working now. There
17 we go. A lot of them look like that; right. A lot of them
18 look like that; right.

19 So, we're talking about everything from
20 construction and maintenance in the field to software
21 engineering; right? So just remember we're talking about a
22 whole lot of different kinds of jobs and we have to say
23 what that means, you know, construction, we divide that
24 into installation, maintenance, operations, project
25 management, there's also sales and marketing and system

1 design and engineering and manufacturing, R and D. I don't
2 want to go in the weeds. I just want to remind you that
3 the important thing is that we start with knowing what the
4 jobs are and then we move to the training.

5 So, now, again, I will return to the one slide
6 that I have that explains everything that is a diagram
7 that, I think, is near and dear to labor economists
8 everywhere. And that is describing essential elements of
9 workforce development. And it looks like that.

10 So, this is the technical part as I said. I
11 think, I just want folks to think about these things
12 together. So, to deliver equity you have to understand all
13 of the stakeholders in this. So, you have businesses,
14 which are the firms who employ people, you have workers
15 who do the work and where possible are represented by labor
16 unions or other organizations that are paying attention to
17 worker interests, and you have education, these training
18 systems which could be SBO's; right? They could be
19 community based organizations, they could be community
20 colleges, they could be labor unions, they could be any
21 number of training programs. But you need all three. And
22 if you think for a minute what would happen if we left one
23 of these out. If you leave the firms out and you just have
24 workers and training systems, that's okay. We know what
25 that looks like. But you're in danger then of training

1 folks for skills that they don't need for jobs that don't
2 exist. You have to know what's happening in the labor
3 market. If you leave out the training piece, then we're
4 just old school. Then it looks like 20th century workforce
5 development; right? Firms and workers are on their own.
6 You get trained once, you go in the job market and you end
7 up with a lot of skilled mismatches and no upward mobility.

8 And the last one. We also see this quite often.
9 And you're thinking about designing and training a jobs
10 program. Is you do firms and training systems but you
11 forget the worker interests; right? So, if you do that,
12 you end up with training and hiring and training without
13 concern for job quality. And without concern for the
14 interests and the capacity and the needs of the kind of
15 workers that we are trying to move up in the labor market.

16 So, I encourage us to think about all of these
17 things and to know that I can't emphasize enough that if
18 you want to provide opportunity for those who have been
19 excluded from opportunity, and if you want to share both
20 the health and economic benefits of the clean economy with
21 communities who have suffered the worst impacts of the old
22 energy economy, you need to offer something more
23 substantial than a simple training program. You need to
24 engage the entire system.

25 Having said that, I think we're going to move

1 into the discussion. Let me say that both sets of the
2 recommendations, as we've seen, call for more training,
3 more jobs, and attention to quality in both. I think that
4 is great and that is essential. The question for the group
5 is going to be how do we ensure that these labor market
6 strategies actually deliver the economic promise of clean
7 energy for disadvantage communities.

8 And I'll run through the questions. I think
9 we're going to do this by looking a little bit of what that
10 looks like on the ground. A little bit about considering
11 the specific recommendations in the Barriers Report and how
12 this interacts with supply and demand in the labor market.
13 And I think throughout, again, I want to hang a lantern on
14 thinking about an integrated approach. Not just to energy
15 and transportation, but to how do we align the workforce
16 imperatives of SP350 with those outlined in 118, Prop 39,
17 the many CPUC processes that are happening now, SB1; etc.,
18 that we want to think about this in an integrated manner.

19 So, what I think I'd like to do is go around and
20 have each of the panelists introduce themselves, give you
21 some of their remarks, and then we'll move into -- I have
22 two pages of questions. We won't get to all of them today
23 but let's start by going around.

24 So, Carol do you want to start?

25 MS. ZABIN: Sure.

1 Hi, guys. My name is Carol Zabin. I'm director
2 of Green Economy Program at the UC Berkley Labor Center.
3 And I'm so pleased to be on this panel with Sara White.
4 It's great to see her and the labor agency involved in
5 these workforce discussions with the ARB and the CEC and
6 other energy agencies because I think she offers a real
7 depth of expertise on what works.

8 Our organization is a research and education
9 organization. We've done a lot of commissioned work on
10 workforce recommendations having to do with climate policy,
11 including several studies for the IOUs at the behest of the
12 public utilities commission on their energy efficiency
13 programs and also a lot of studies on job impacts and
14 various climate policies.

15 Is that all you want right now? Or do you want
16 me to say --

17 MS. WHITE: Okay, let's go around and just do
18 introductions. That's make sense.

19 MS. ZABIN: Okay.

20 MS. WHITE: And then we'll come back.

21 MR. BRAUER: I'm John Brauer. I'm the workforce
22 and development director at the California Labor Federation
23 and the workforce and economic development program at the
24 Fed. We resource our affiliate on apprentice and
25 preapprentice programs around the state. We're involved in

1 the Prop 39 initiatives that the state workforce board has
2 been building in nine different regions. As well as
3 working with the California Department of Ed and putting
4 those same apprenticeship readiness programs in about eight
5 different high schools as a start of the California
6 partnership academy process. We work quite a bit also on
7 to get them additional resources. Some of which come from
8 you all and ETP and others to get journeyman and apprentice
9 skill upgrades. We're, for instance, involved in the
10 automated demand response initiatives that you all are
11 doing in conjunction with IBW and NECA as part of the
12 apprenticeship system building off of that.

13 We also have been doing quite a bit around AB118
14 through ETP working with the transit agencies and we helped
15 Santa Clara Valley and Commissioner Scott has been out to
16 help create four different apprenticeship programs out
17 there. But also, as they're converting their fleet over to
18 have the workers there. And so, we're kind of involved in
19 both the construction energy efficiency, renewable side of
20 things, as well as the transportation piece.

21 MR. NAKASONE: Ross Nakasone, BlueGreen Alliance.
22 The BlueGreen Alliance is a coalition of labor and
23 environmental groups. We're national, nonprofit. And I'm
24 here in California.

25 Our mission is really to try and address

1 environmental challenges in ways that actually create and
2 maintain good union jobs. So here in this arena our focus
3 has really been on increasing access for those in
4 disadvantage communities and low-income communities to good
5 career track, clean energy jobs.

6 Let me just say we were really heartened to see
7 the job quality and job access components that are now
8 principal recommendations. We're excited about that. You
9 know, we really do see the report as sort of a first step
10 in addressing a lack of access for those in disadvantage
11 communities and communities of color so. Looking forward
12 to more.

13 MR. PARHAM: My name is Melvin Parham with Rising
14 Sun Energy Center. I am the director of the GETS program,
15 Green Energy Training Services. I oversee the workforce
16 development pieces as far as, like, the construction,
17 pre-apprenticeship training that we have. I also oversee
18 our solar program as well. We also have a youth program to
19 where they do energy efficiency and they go into low-income
20 community homes and they install measures into their homes
21 to make their home more energy efficient. I also do a lot
22 of job placement. So, I will train somebody for up to 12
23 weeks of training, recruit them from low-income
24 communities, give them the necessary skills in our
25 pre-apprenticeship training, and then place them into

1 careers. So, I move the low-income community from being
2 low-income and to going into livable wage jobs.

3 MS. WHITE: Great. Thanks, everyone. I think we
4 could spend an entire day with these four folks. Actually,
5 a week but we don't have that so.

6 I'm wondering if we could -- Carol, if you want
7 to set this up for us. How are we supposed to think about
8 this before we talk about some actual concrete programs on
9 the ground. But how do we think about this mix of job
10 quality and training and different policy levers and how
11 state programs can align on this. I mean, how should we
12 think about this supply and demand question?

13 MS. ZABIN: Well, I think as we --

14 UNIDENTIFIED SPEAKER: Microphone.

15 MS. ZABIN: Sorry.

16 MS. WHITE: Thank you.

17 MS. ZABIN: I think it is really important to
18 discuss the role of energy agencies and what they can do
19 and what they cannot do. And I think their most powerful
20 role in setting up the outcomes that we want, which are
21 getting folks into good careers, is your role in shaping
22 the jobs that are created by either the public investments
23 that you directly oversee or the mandates that end up
24 generating private investment.

25 And what we've seen, you know, it just to break

1 it down on the energy side, most of the jobs that are
2 accessible to folks without access to a college education
3 are blue collar construction trades jobs in energy
4 efficiency and renewable. It's not all the jobs, but
5 that's the bulk of them.

6 And there we have in place in the state
7 mechanisms and institutions that make those jobs good jobs
8 and that create pipelines into them for folks with less
9 skills and opportunities and that is through our
10 apprenticeship system and through mechanisms, such as,
11 community workforce agreements that set a standard on the
12 job quality and then have -- has language that actually
13 sets goals for hiring of targeted groups or groups --
14 workers from local areas. And those have a track record of
15 working in all kinds of public works projects but they also
16 have been used in building utility scale. Renewables, etc.

17 And I was very pleased just to see a new
18 community workforce agreements signed in Fresno as part of
19 the -- transformative climate communities program where all
20 of that GGRF funding will be allocated in a way where
21 there's a framework for insuring that local folks are --
22 have access to these career paths in construction through
23 apprenticeship.

24 On the supplier, the preparation of workers,
25 that's really not your area of expertise in the energy

1 world. But I think what we're seeing is some efforts to
2 align the funding that you can designate or have designated
3 for training. And I would include, for example, here the
4 \$30 million that the IOUs have for training. To align
5 that, again, with the systems that already exist and are
6 the main training. So, I was pleased to see that
7 recommendation.

8 And with Prop 39, and now SB1, there is a real
9 opportunity with the CEC and the ARB to sort of funnel all
10 that money into the same place where it can then be
11 deployed to -- in an coordinated aligned way to help folks
12 get into these pipelines through -- in construction.

13 Now, I'm not supposed to call it
14 pre-apprenticeship anymore. I'm supposed to call it
15 apprenticeship ready programs but what we mean by that are
16 the ones that are actually linked and have a track record
17 of getting folks into apprenticeship, like Rising Sun has
18 worked really, really hard to do.

19 And for other sectors who don't have such
20 established apprenticeship there's opportunity to create
21 apprenticeship which we're doing in transit or use the same
22 elements of one ensuring a livable wage for the public
23 investments that we're making. And two, you know, creating
24 a pipeline through preparing workers.

25 So, I think I should stop there.

1 MS. WHITE: Yeah, that's great. I think -- can
2 we advance the slide one for me? We sort of broken down
3 the -- the CEC recommendations into sort of two parts of
4 what you're talking about. One, is the supply side, you
5 know, by which we mean it's the supply of workers; right?
6 It's human capital, it's skills, and the training systems
7 that deliver them, and the demand side, of course, is the
8 jobs.

9 So, I think we should tackle them separately and
10 want to talk about community workforce agreements. I think
11 that's pretty essential, that's on the demand side. On the
12 supply side, we were sort of headed with this
13 apprenticeship conversation. I want to touch on that a
14 little bit more and maybe talk about some examples.

15 I mean, I was wondering if perhaps to drop from
16 our, you know, 500,000-foot conversation about job quality
17 that we could move into really explaining to folks what
18 this looks like and why you want the experts to do this
19 work.

20 And so, I was going to ask Melvin, actually, if
21 you would talk a little bit about -- well, almost any of
22 your programs. But the one I'm most familiar with, which
23 is your Prop 39 pre-apprenticeship program, and the ways --
24 why that is so important and why this works in disadvantage
25 communities.

1 And I was thinking specifically also about, you
2 know, the real ground breaking work you're doing with like
3 [indiscernible] informed training and these kinds of things
4 which are important. So, let's hear from you on that and
5 then I'll move to John to talk a little bit more about how
6 apprenticeship systems work in general and the MC3
7 programs.

8 So, Melvin, do you want to weigh in?

9 MR. PARHAM: Absolutely.

10 Yeah, so our program -- first of all, let's talk
11 about our demographics. We serve low-income men and woman
12 with barriers to employment. We actually go into the
13 communities. We network with the local [indiscernible],
14 the one stop career centers. We network with the adult
15 schools. We also go to a lot of high schools and we bring
16 in disadvantage workers into our training facility. We
17 give them over 280 hours of hands-on training, down the
18 line of MC3, which is multicraft core curriculum. That
19 curriculum is recognized by the building trades. And what
20 it does is that gives them the tool belt under them, under
21 their cape. So, basically, they get the tools and the
22 necessary equipment that align the professional skills
23 development, that align of construction. We also run an
24 all women construction training program as well. And it
25 gears them up for workforce, you know, being ready for the

1 workforce. We network with unions, a lot of union
2 involvement. So that's taking them out the field trips to
3 the union, that's bringing unions into our facility to
4 speak with them and do some type of hands-on training with
5 them. That also give them a case manager and a job
6 placement coordinator to work with. So, they have all this
7 training that they -- and all the support system. We
8 network with other organizations like West Oakland Job
9 Resource Center. We network with Trace Woman, Inc. So, we
10 build this huge platform of experts to help the
11 participants to get to where they need to go.

12 Our training, what we do is we give them
13 completely hands-on in the field real life experiences. We
14 do a lot of research down the line of what's working and
15 what's not working. And we go back to our advisory
16 councils, what we call it. We have a workforce advisory
17 council that we network with them to say what do they need
18 to be learning in the field. We then teach them that,
19 after gathering all the information, we teach them that.
20 And then we re-access where we're at with them.

21 A lot of things -- one thing that we did change,
22 we started using Roots to Success. Roots to Success is
23 another curriculum to where we actually get them to see a
24 lot of things that where disadvantage communities don't
25 have access to certain things that other communities may

1 have access to. So that was something that we built on a
2 lot.

3 One of the biggest things with our program is
4 that we placing people into employment, into meaningful
5 jobs, jobs that they didn't have access to or didn't have
6 no knowledge to go into until they walk into our doors.
7 Being able to network with other organizations that's
8 providing the same training for pre-apprenticeship allows
9 us to, you know, work together into bringing people under
10 our umbrella and then sending them out into the workforce.

11 MS. WHITE: Thank you so much. I'm wondering
12 if -- John, if you could follow up on that. I'm thinking
13 of two things you can take this in that direction. One, is
14 sort of talking about the kinds of curriculum that Melvin
15 was talking about sort of the importance of -- with
16 training. It's not just classroom training and I don't
17 mean by that it's also hands-on training like an
18 apprenticeship, but it also this piece of wrap-around
19 services and the transformative nature of this kind of
20 work. Like what it really means to do training -- and then
21 maybe move from that genre to talking a little bit more
22 about MC3 and apprenticeship and what that looks like. And
23 maybe how that -- maybe that -- maybe this is all much --
24 also how that solves this problem of, you know, we have all
25 these -- we want to put a lot of investment into training,

1 but how do we train up a workforce and make sure that they
2 are, you know, as Melvin was saying, connected to jobs and
3 not just searching for jobs. And apprenticeship, I think,
4 solves that problem. So maybe you want to take on a couple
5 of those.

6 MR. BRAUER: Let me just start with I think, you
7 know, this governor set a goal of actually doubling the
8 number of apprenticeships in having a million certificates
9 and credentials be created over the last -- by the end of
10 this -- by 2020. So, I think, there has been both
11 nationally -- because I think even the current White House
12 supports apprenticeship. But -- and in the State of
13 California the real value of it.

14 The big failure, I think, in American education
15 and workforce is we don't help a lot of younger people but
16 folks in general find a calling. An apprenticeship is
17 probably the best and closest to helping folks do that.
18 The apprenticeship system is also really driven by the
19 actual industry demand that's taking place. So, there's a
20 real opportunity, again, as you heard before, to link the
21 actual jobs to the demand going on. And, frankly, the
22 system that creates a real career path for folks as they
23 enter in it.

24 In a lifetime, I must say I've been to watch --
25 we do quite a bit of helping our affiliates apply for ETP

1 funds. And I've seen solar installers companies, one of
2 whom still strikes me to this day, they also make electric
3 cars, but they came for an application and asked for funds
4 to do two weeks of training on the sales side and two days
5 for the solar installers. And I was -- it was pretty
6 amazing to me that -- what that may look like in the long
7 term.

8 But having said that, I -- a couple of things,
9 one, is the apprenticeship system is a way to have folks
10 gain four or five years and frankly \$40 to \$50,000
11 investment by the employers and the union in the training
12 of those folks. That's not public monies that's coming,
13 those are monies that are coming as part of that joint
14 apprenticeship training agreement and a real investment by
15 the industry itself in those workers. And a very clear
16 path to graduation. They also were marked by real job
17 quality. There is real wage progression based on both
18 experience and also skill attainment. And it's absolutely
19 critical in this equation.

20 And we think that that's also then really a
21 question of equity. Both in terms of folks accessing jobs
22 related to clean energy but also frankly the quality of
23 those jobs I presume is part of the job quality equation
24 for you all in the equity, answering the equity piece of
25 that. You have a state regulated pathway in system there

1 and a federal system in relationship to that.

2 On the apprenticeship readiness side, the piece
3 that -- and the undertaking that the state workforce board
4 with the Prop 39 dollars and the other initiatives that are
5 being taken regionally, such as Melvin's program, is that
6 they're actually tied to real apprentice programs. One of
7 the requirements for the state workforce board and for
8 local workforce boards, for instance, AB54 basically said
9 if you had what was called a pre-apprentice program, that
10 it actually had to agreement with existing registered
11 apprentice programs. So, there's a real accountability
12 piece.

13 And that the MC3 curriculum and the multicore
14 career curriculum and the initiative around the Prop 39
15 stuff, also then gives local communities both a way for
16 those who are not ready for the outreach to get into
17 apprenticeship immediately, to have an additional door for
18 folks to get into to have an ability to start to understand
19 what the possibilities are within the construction trades
20 or the -- or within the energy industry itself. As well as
21 then to address supportive services and other issues,
22 barriers that folks may have in that particular equation.

23 It's also, frankly, a really good way to start to
24 address some of the failures of the apprenticeship system.
25 Even the Rising Sun is having cohorts of half-women or 100

1 percent women. In particular, cohorts where an
2 apprenticeship and some of the trades that we've
3 historically had that as a real issue, as well as other
4 communities out there. And I think you're really starting
5 to see a significant change in that.

6 We, for instance, are working, again, with IBW
7 and NECA on the automated demand response. The goal of
8 that initiative that you all are funding is to use the MC3
9 as a way to recruit both by the local IBW, but also then
10 the existing MC3 programs to bring folks from those
11 disadvantaged communities in. Both into their apprentice
12 program but also then into the IB -- into the MC3 if
13 they're not ready.

14 So, I think, just again, I think the fact that
15 it's also demand driven and that's -- the other piece of
16 this that I think is probably the hardest, whether it's a
17 community college, the adult school, a community based
18 organization of the community in general is really
19 understanding that those apprentice programs and the MC3
20 programs, frankly, are built on the actual demand going
21 forward in that locality in that region. You can't just
22 have, what former secretary of labor Tom Perez called, a
23 system of "trained and pray." And, you know, it's just the
24 best way to meet the expectations of everyone frankly.

25 MS. WHITE: Thanks John. I think -- I like the way

1 you're talking about it, which it reminds me that
2 apprenticeship also is a, you know, it's a process. it's
3 not a thing. I mean, it's not just -- to be an apprentice
4 you have a job so you're doing training and working; right?
5 So, it's, I think, I hear a lot of people say well let's do
6 a whole bunch more apprenticeships. But unless you have
7 the jobs you're not an apprentice. It's a requirement.

8 So, thinking about how that unfolds over time and
9 really about -- and the importance of that in the targeted
10 communities. Because you're connecting people to careers
11 rather than single jobs; right? And I think that's a huge
12 thing.

13 I want to -- I want to ask you some more specific
14 questions about apprenticeship but I did want to also
15 quickly raise the issue again of job quality and just do
16 some defining, because I think we throw around these terms
17 but we don't always know what we mean by that so. The
18 obvious metric for job quality is wages; right? So, we
19 look at wages. But there's a whole lot of other things
20 that go into job quality; right? So it's benefits. It's
21 access to fair scheduling. It's workers having a voice in
22 the conditions of their own work. It's having some
23 autonomy. There's a -- the more intangible pieces of
24 worker voice are also critical here. And, I think, that's
25 why having union apprenticeships in this case is about also

1 connecting workers to a series of institutions that are
2 representing that voice.

3 But in and outside of the union question, I was
4 wondering, you know, this key, if we turn to the demand
5 side for a second, this key to getting job quality can be
6 through the community workforce agreements; right? It's
7 one of the ways that we know that we can have quality jobs.

8 And Ross, I was wondering if you wanted to say a
9 little bit about how community workforce agreements work
10 and what their advantages in this context.

11 MR. NAKASONE: Sure. So, you know, community
12 workforce agreements really are a, you know, an arrangement
13 between the -- I'm sorry. What is the triangle, between
14 workers and firms, between labor and management? We intend
15 to negotiate kind of some of the terms and conditions of
16 the work going forward. But the advantage -- so that's
17 sort of the -- but the power of the community workforce
18 agreement really, I think is found in where the community
19 organizations actually intersect with that effort. They
20 are involved in the development of the community workforce
21 agreement and experience really has focused in on ensuring
22 that the workers who are actually engaged in the work
23 associated with that agreement are locally hired, are from
24 disadvantage communities are -- that there's some sort of
25 consideration for workers' who have employment challenges.

1 As well as ensuring training to the extent that, you know,
2 there's some sort of specific components as it relates to
3 the agreement.

4 But, I think, one of the, sort of, most powerful
5 components of that really is about that it's bringing kind
6 of a broader section of parties together, communities,
7 workers, as well as management. And they're really setting
8 concrete standards and goals around the agreement that
9 everyone can sort of agree to. And then ultimately, you
10 know, it promotes accountability and transparency with the
11 goals and with everyone engaged and their folks sort of
12 monitoring how these agreements move forward to, frankly,
13 make sure that all -- all parties interests are actually
14 recognized.

15 MS. WHITE: Thanks so much. I just wanted to let
16 folks know too that the state board is actually working on
17 a series of tools and convening to help other state
18 agencies who are interested in tying community workforce
19 agreements to the kinds of investments they're making in --
20 for example, with the Transformative Climate Communities
21 but also with Clean Energy and Transportation to give some
22 people guidance on how that actually works and how you
23 build those.

24 So, we will be -- you can come to us for
25 information on that and we will be helping hopefully move

1 that, with this part of the recommendation, into the
2 mainstream of the way the state does business.

3 I'm wondering, there's so many, many things to
4 talk about. I wanted to go back for a minute to the -- the
5 pre-apprenticeship and the opportunities of apprenticeship.

6 And John, I'm going to return to you quickly for
7 a second. I'm wondering if you want to talk a little bit
8 about what this looks like on the transportation side. And
9 I'm thinking about this in the case of, you know, again,
10 connecting workers to career pathways that they might not
11 have had before in the context of apprenticeship and what
12 that looks like.

13 MR. BRAUER: I can just give you the example of
14 what Santa Clara Valley Transit and our local ATU 265 and
15 folks have been working one which is we -- they have
16 created within the transportation agency four different
17 apprentice programs that are DOL and DAS certified. The
18 initial one is a bus coach operator that's been certified
19 as the first of its kind in the country, believe it or not,
20 that got certified by DOL and DOS -- DAS. As well as an
21 existing bus mechanic program -- apprentice program that
22 they created and then rail worker and overhead line worker.

23 What they did also as part of that was realign
24 their job functions and positions with the transportation
25 authority. So, they lined up other occupations that are

1 not apprentice occupations right now but took them from
2 being dead-end jobs and put them into creating career
3 pathway pieces. They also have, frankly, taken the bus
4 coach operator as sort of the entry point within the
5 transportation system as a whole. So those folks were
6 either on the operator side or the mechanical side or even
7 the light rail are coming through that initial
8 apprenticeship for a period of time. It's a way to sort
9 of, like on the equivalent of the MC3, to introduce folks
10 to the agency itself to the range of occupations to the
11 culture of it. And as well as the basic work processes of
12 being a bus coach operator but also from that end.

13 We are now talking with other ATU locals and
14 other transit agencies about replicating some of that --
15 those exact kind of career pathways and apprenticeship
16 programs as a start. We're also sitting down with the
17 local workforce boards and the transit agencies to try and
18 see if we can't create either an apprenticeship readiness
19 program or a transit boot camp, frankly, you know. We have
20 had Santa Clara Valley that the turnover over the next five
21 years, you know, is several hundred bus coach operators. I
22 mean, the demand is going to be there from the replacement
23 side of job growth. And they're not alone in -- as a
24 transit agency in that piece. As well as really needing to
25 deal with the mechanical side.

1 So, there are lessons that can be learned and
2 have been learned from the building trades being very
3 robust apprenticeship system in the State of California to
4 looking at creating that in -- on the transportation side.
5 Again, the number of apprentices and those openings are
6 tied to what the transit agencies are looking at as their
7 demand going forward. They know how many are eligible to
8 retire right now as well as go forward. And it's also the
9 other big plus for Santa Clara, I think, and again, you all
10 have been a major funder, is they're trying to turn their
11 fleets over in terms of different energy uses and they're
12 no different than any other transportation agency.

13 So, it's a way to upscale their existing
14 workforce and also bring new folks into meet as they're
15 changing over to electric or hybrid or CNG or whatever
16 they've been - whatever they're going in.

17 MS. WHITE: Right. Because the alternative fuels
18 have changed the technical nature of the job; right?
19 There's an incredible amount to learn if you visited one of
20 these sites I encourage you to; right. Of the, you know,
21 moving towards electric or one of the hybrids that you're
22 suggesting.

23 MR. BRAUER: Right.

24 MS. WHITE: The things that folks have to know in
25 order to do these jobs. I mean, it's a classic example of

1 traditional job with an entirely new set of skill set
2 because of the highly technical nature of the evolving fuel
3 structure.

4 MR. BRAUER: And I would say that the
5 transportation agencies themselves, authorities themselves,
6 are very interested in that local hirer disadvantage
7 pipeline as well. I mean, we're kind of hearing that and so
8 are the unions. I mean, I think, it's the same wants.

9 MS. WHITE: Right. Thanks John.

10 Carol, what are we missing?

11 MS. ZABIN: Well, I guess, I'd like to hear
12 questions from the commissioners. Maybe we're there. I
13 think we're there.

14 MS. WHITE: If there aren't any, we can continue
15 this discussion, that's okay.

16 MS. SCOTT: I don't have any specific questions
17 right now.

18 MS. WHITE: Okay.

19 MS. SCOTT: I really was kind of looking for --
20 you've got a very nice list here --

21 MS. WHITE: Right, yes. No, we weren't trying to
22 put you on the spot. I just didn't want to hog the light
23 because I could talk about this all day so.

24 MS. SCOTT: Well, no, no. I do think we want to
25 have a little bit of time for questions. I was wanting to

1 hear a little bit more about some of the thoughts on your
2 questions before I weighed in but.

3 MR. WEISENMILLER: Yeah. I guess the one
4 question I had was Carol has talked a lot about working
5 with the IOUs on some of the workforce questions. How
6 about the POUs? Have they been involved with the -- anyone
7 on the panel?

8 MS. ZABIN: Well, you know I do -- we always
9 highlight one of the best training programs in the state,
10 which is LADWP's model of the precraft training program
11 which differs a lot from the IOU programs in the same
12 sector which is weatherization for low income communities
13 and now it's moving into their community solar program.
14 But we highlight that because it has the -- even though
15 it's not under a community workforce agreement structure or
16 project agreement structure, the elements are the same. In
17 that, you know, it comes from the -- it's completely tied
18 to the number of jobs so you're not training folks for no
19 job. It's a learn while you earn model. It's a
20 pre-apprenticeship model in the sense that instead of going
21 into the construction trades, in this case, you're going
22 into utility work and helping with the aging workforce
23 issue and turnover that the utilities dealing with.

24 But again, it's a structure where it comes from
25 the investment side of the labor market, it comes from the

1 jobs. And all the training is calibrated to that and it's
2 calibrated in a way where people come in with low skills
3 and as they move up in skills they move up in wages. So,
4 there is a real structured career ladder.

5 In the IOUs programs and contrasts,
6 weatherization is outsourced to a variety of different
7 organizations who may be, you know, very community focused
8 and well-intentioned but they don't have anywhere to place
9 people. So, same with CSD and we've been working with the
10 Community Services Department on their weatherization and
11 solar programs. And the problem is they're dead-end jobs.
12 And how can you link them? LADWP can link them because
13 it's part of their, you know, it's part of their
14 institution as an employer. There are ways to link CSD
15 programs or the IOU, low-income weatherization programs.
16 But it has to be intentional, otherwise it won't happen.

17 So, we've suggested, for examples, for CSD that
18 in their call for proposals to carry out and administrate
19 the work as they add workforce development they look for
20 best in class training programs that already are linked to
21 apprenticeship, like Rising Sun, which don't exist all over
22 the state but they exist in a lot of areas where those
23 training programs already have links to a career and at --
24 through their -- with certified -- state certified
25 apprenticeship programs.

1 So, there are ways to do it, LADWP is -- it's
2 easier for them because they have the whole utility and
3 they're not contracting out that work.

4 So there, yeah, so -- does that answer your
5 question?

6 MR. WEISENMILLER: Yeah, a couple of others. I
7 mean, I know one of the things -- being in like Curran
8 county, one of the things the education folks say there is
9 that the fossil fuel industry, which is not what we're
10 talking about today, but they basically have a connection
11 to the, you know, community colleges there to say, okay,
12 this is how many people we're going to be hiring in the
13 next X years.

14 MS. ZABIN: Right.

15 MR. WEISNEMILLER: And so then has community
16 college focusing its training programs.

17 MS. ZABIN: Right, right.

18 MR. WEISENMILLER: And, again, that sort of
19 connection between, okay, we're training people but we have
20 jobs lined up as opposed to just a hope and a prayer.

21 MS. ZABIN: Yeah, exactly.

22 MR. WEISNEMILLER: So how do we get that more
23 generally to the challenge?

24 MS. ZABIN: Well, I think through these
25 initiatives around apprenticeship. I mean, every

1 apprenticeship program has a local educational partner
2 which is a community college.

3 MR. WEISENMILLER: Right.

4 MS. ZABIN: And there is new funding for
5 apprenticeship at the state, you know, frankly,
6 apprenticeship works better when there's some -- somebody
7 able to negotiate wage increases as skills are acquired.
8 Without that employers want to use a system and keep the
9 wages low even though they're using the public system to
10 train workers and it doesn't work in the long run because
11 there's higher turnover when the jobs aren't good and the
12 investment and training is then just lost. It's very hard
13 to train for bad jobs.

14 So, I do think this expansion of apprenticeship
15 and using the elements of apprenticeship where you start
16 with the jobs, you get commitments from employers to have a
17 career path, that's kind of the only way it works. We
18 haven't seen, you know, we face the labor market with a lot
19 of low wage jobs that don't go anywhere and the question
20 is: do we want to build our clean energy economy that way
21 or do we have an opportunity to use the assets and
22 infrastructure that the state already has where it works?

23 It's actually moving people up and make that
24 choice. And you guys have a role in making that choice by
25 structuring your investments so that there are standards on

1 the -- on the contractors who participate in the building
2 the clean energy economy.

3 And that's your most, again, I'd say that's your
4 most powerful role. And if you can donate some of --
5 little bits of money here and there for a
6 pre-apprenticeship programs that are also getting funded
7 from the educational system and other sources, that's
8 wonderful. But your power is in shaping the jobs.

9 MR. WEISENMILLER: Historically the utility meter
10 readers was sort of the classic entry path if you looked, I
11 think it's like a three year, ten year and they moved,
12 somewhere in the utilities but. What's the current gateway
13 into the utilities? As you pointed out, they all face
14 these aging workforce issues, there's huge opportunities
15 there for really good jobs.

16 MS. ZABIN: Right. Yeah. And the gateway can be
17 lineman, men and women, tree trimmers now have become some
18 of a gateway with the case of LADWP, it's the
19 weatherization workers, and it could be community solar
20 workers, you know, utility own community solar, where they
21 have some leverage over the contractors who are installing
22 or they do it as, you know, as part of the utility employee
23 role and tasks.

24 So, there are -- there are -- there really are
25 plenty of entry level positions that could serve that

1 pre-apprenticeship role to help people then find their
2 calling in one of the skilled trades or in, you know,
3 pipeline repair or many, many things that utility still --
4 the grid utilities are still responsible for.

5 MS. SCOTT: So then, I had a question about the -
6 the demands for these programs. John, you mentioned that
7 you have lots and lots and lots of transit workers who are
8 ready to retire. Do you have a whole bunch of folks in the
9 trades that are looking to come into those positions? I
10 mean, I think the additional layer on that question would
11 be what Carol is raising, which is and then does that lead
12 to a way up your way up the chain and get on a career path?

13 And, then, I might ask the same question to
14 Melvin about your program where you can start as early as
15 high school, it sounded like you were saying, and make your
16 way right onto a living wage pathway and are you finding
17 that you have to turn people away at the door because
18 there's so much demand that you just can't keep up or
19 what's the sense of how much demand is out there for these
20 programs so that we can kind of think about the scale of
21 the needs to be.

22 MR. PARHAM: I can take the first. I can take
23 the question. So for me, on my side, and I do network with
24 a lot of other organizations that run pre-apprenticeship
25 programs. All of our apprenticeship programs are always

1 maxed out between 25 and 30 people. We run them at least
2 three times a year. And we, ourselves, we have a graduation
3 rate of 85 percent. So they continue throughout the
4 program. Our graduation rate itself -- I mean our
5 placement rate itself is at 86 percent. So everybody
6 that's coming into our program is getting something out of
7 it using the MC3 curriculum. They really do appreciate the
8 structure of the pre-apprenticeship program and then going
9 into the jobs that they have been trained to go into.

10 Now I would say, just to back up a little bit,
11 about the energy efficiency questions that Carol was
12 tackling. We switched our program around a lot. We was
13 all energy efficiency based program to where we was doing
14 installation into the wall, floor, attic, and crawl spaces
15 and the things of that nature. We found out that the jobs
16 was all low wage paying jobs. So wasn't taking the
17 community out of the poverty levels that they're coming in
18 at, you know, the highest paying job was between \$13 and
19 \$16 an hour. Now somebody can come into our program from
20 being on Cal Works getting a check for five eighty-three a
21 month to now getting twenty-six fifty an hour by going
22 through the trades. So we did restructure our program for
23 that.

24 We do hold classes three times a year, which
25 accommodate 20 to 25 people and the graduation rate is

1 about 86 percent. So we have an [indiscernible] amount of
2 people ready to come in. Especially woman. We've
3 increased our woman population by 70 percent.

4 MS. SCOTT: And I don't know, John, if you had
5 any thoughts on that as well.

6 MR. BRAUER: Well, I was trying to understand
7 your first question. Because I consider sort of the
8 transportation and that piece different than the building
9 trades piece.

10 MS. SCOTT: Fair enough. So, you think that it
11 does have the career path that Carol was talking about that
12 was missing from the energy efficiency side?

13 MR. BRAUER: I would just reiterate sort of what
14 Melvin said. I think the experience of a bunch of our
15 pre-apprentice programs frankly have -- and we had a
16 discussion about this at our quarterly meeting. A lot of
17 them are looking at both from a social enterprise aspect
18 but also they've actually gotten local publications pieces
19 of doing some energy efficiency but other various kinds of
20 activities.

21 And, frankly again, if anything, building on the
22 existing system for supporting those kinds of things where
23 that's the best example of how that should work frankly in
24 that kind of equation.

25 I can't give you the specific demand on the

1 transportation piece. I do know, again, the applicability
2 of building trade stuff to the transportation side isn't a
3 clean fit. We even have trouble I know from some of my
4 transportation -- working with some of the ETU locals and
5 the transportation agencies.

6 The bus mechanics, you can't get those folks from
7 the car dealership apprenticeship program and expect them
8 to work. I mean, it really is specific to the industry and
9 the demand that they've got. They've tried to do that to
10 be an answer and it's part of why places like Santa Clara
11 are set up are putting in place the apprenticeship programs
12 that they've got. Or other agencies are trying to fix the
13 existing bus mechanic programs that they've got in that
14 particular equation.

15 I do know that from an aging prospective they are
16 all saying, whether it's bus coach operators or mechanics,
17 that that demand is there for the next long while.

18 MS. SCOTT: Yeah, that is what I was wondering.
19 You know, if you have 50 people who are leaving in the next
20 month, do you have 50 people knocking down your door
21 saying, help me figure out how to get on this pathway.

22 MR. BRAUER: Well, part of it is folks on the
23 transportation side don't know that those opportunities are
24 there.

25 MS. SCOTT: So there is more outreach that needs
26 to be done so that people know these opportunities are

1 here.

2 MR. BRAUER: And training.

3 MS. SCOTT: Okay.

4 MR. BRAUER: I would tell you that to be a bus
5 coach operator in a bus in a major metropolitan area is an
6 extremely difficult job. Not from the -- aside from the
7 fact that you've got 15 to 50 computers on board and you're
8 driving a very large vehicle, but the level of customer
9 service training, conflict resolution, problem solving,
10 frankly real health and wealth necessary issues. And,
11 again, it's why places like Santa Clara are setting up
12 those apprenticeship programs and building on their joint
13 worker centers because they're trying to get themselves to
14 being in a place that's, frankly, industry driven and
15 worker centered and now they're trying to move also on --
16 if we can do like the boot camp and other things to be
17 community focused on that.

18 MS. WHITE: I think there's another piece of
19 this, returning to the -- oh, Carol, you go ahead.

20 MS. ZABIN: Okay. I was just going to say though
21 there's always greater demand on the part of low wage or
22 unemployed workers for these good jobs and good pipelines
23 than there are pipelines, and that's why it's so important

1 for those who influence the investment side when they have
2 a choice and there are way, way more opportunities to make
3 that choice to go with, you know, contractor -- responsible
4 contract language. I know there's a proceeding in the CEC
5 on -- what does responsible contractor look like, choices
6 to go with contractors who are willing to participate in
7 community workforce agreements, go with LADWP's model of
8 insourcing weatherization. I know we can't probably change
9 the IOU structure, but when we have new things we should
10 look for the better structures that put people on a path
11 and hold up our public investments to a standard on the
12 workforce side.

13 It gets you way, way better work, too. I mean,
14 I've had a lot of discussions with Andrew about the quality
15 of work on energy efficiency, which is, you know, the HVAC
16 classic example of so much energy savings left on the table
17 because we don't have a skilled workforce. Not that there
18 isn't a skilled workforce, but they're not -- their
19 contractors aren't the ones who are getting the gigs
20 because there are no standards and so the competitiveness
21 in the construction market is such that we're doing a race
22 to the bottom instead of a race to the top so.

23 MR. WEISENMLLER: Carol, just to be on the

1 record. We've lost three PC commissioners, all of whom are
2 very interested, some of them are listening as they're
3 driving elsewhere, all of whom have their staff here in the
4 audience. So it's not that they're not interested in these
5 issues, but just [indiscernible] demands. They certainly
6 asked both of us to make it clear they are listening and/or
7 have staff listening.

8 MS. ZABIN: That's nice to hear, great.

9 MS. WHITE: I wanted to return just for a quick
10 second back over to the supply side where we were in the
11 discussion. And also, Commissioner Scott, the question
12 that you asked about, you know, lining up supply and
13 demand. That's a huge question and somebody if we could do
14 that a workforce development system because we wouldn't
15 need to know that answer it would just work; right? So
16 sort of figuring out this calibration of supply and demand
17 and local labor markets is the grail. We're all trying to
18 do that. And what we're saying is, we have to help the
19 experts who are trying to do that, think about that before
20 just doing investments and training; right? There isn't an
21 easy answer to that and we're trying to get at some of the
22 ways we can do that.

23 I think that's one reason, and again, to come

1 back to the building trades, which is a really unique beast
2 but at the same time is where the majority of access to
3 these sorts of jobs will be for folks at the lower end of
4 the skill spectrum at least at the beginning. And, I
5 think, it's important to remember that -- and this also
6 relates to jobs that the IOUs insofar as they are jobs in
7 the trades, right, and some of them are. Is that you've
8 trained to be an electrician, right, you don't decide when
9 you decide to be an electrician that I want to be an
10 electrician because I'm going to work on this utilities
11 scale generation project, right, you train to be an
12 electrician.

13 So in the same thing, I think, we see this and
14 we've seen in this in Prop 39 and other cases that your
15 connection [indiscernible] construction careers, which is a
16 lifetime prospect of lifting people into the middle class
17 and it isn't always calibrated directly to the particular
18 project at hand.

19 So for example, in Prop 39 when we set up the
20 pre-apprenticeship training for that, the point was to get
21 into construction careers that eventually you will have the
22 skills in order to work on energy efficiency projects, but
23 nobody said that you're going to go through Prop 39

1 pre-apprenticeship training program and you're going to
2 work [indiscernible] that school down the block; right?
3 So, it's a much larger play. It's a much larger gain. the
4 idea is to get people into the construction industry which
5 we need to do to implement a lot of the clean energy work
6 and transportation work that we want to see.

7 So you have to think about the supply and demand
8 in a really global way and not just for, you know, how much
9 demand is this particular project going to generate.

10 MR. NAKASONE: If I can, kind of returning to the
11 transportation, you know, the jobs question relating to
12 transportation. You know, as the energy commission, I guess
13 it was CARB really, right, as the clean transportation
14 side, as you all start thinking about kind of where these
15 jobs are we're talking about obviously operator and
16 operations and maintenance jobs there's going to be, I
17 think, I hope there's going to be a larger demand for --
18 for example, EB buses as we try to clean our transit
19 systems. There is power in that procurement and there are
20 opportunities to really look closely at the type of jobs
21 that are going to be created from the procurement of
22 electric vehicles, specifically electric buses here in
23 California. And that can include both obviously ensuring

1 that they're good quality jobs and, of course, ultimately
2 creating good work but also creating, you know, demand, you
3 know, again, going back to sort of this workforce inclusion
4 component. It can actually require and create demand for
5 folks from communities of color; etc. In order to kind of
6 beat the sort of the out flow of -- not specifically Rising
7 Sun but these sort of CBO and apprenticeship ready
8 programs.

9 And we've seen examples of that, right, the RPS,
10 the Utilities Scale Solar. We've got -- and this is sort
11 of a plug actually. We've got Johnny Simpson here from
12 IBW. He really worked very hard in Southern California,
13 San Diego, Imperial County to really create some really
14 pathways for folks, you know, through local hire where in
15 Imperial County unemployment rate is somewhere in the high
16 20's where it is an incredibly diverse community. And, of
17 course, obviously needed jobs. And they've actually done a
18 really great job about 75 percent on average for their
19 contracts for local hire. When these things work; they can
20 work.

21 MS. SCOTT: I think in addition to the vehicles
22 themselves the infrastructure that supports them, that
23 lends itself to that as well.

1 MR. NAKASONE: Infrastructure, yes.

2 MS. WHITE: Absolutely. I think that this brings
3 up back to a question that we started with in the
4 beginning, which is sort of everyone wants a workforce
5 development program. How do we do that without
6 fragmentation and atomization and lots of parallel
7 investment; right?

8 Sort of, I think, this is kind of like the
9 discussion of aligning supply and demand. It is also that
10 we know what programs work. We know to some extent what
11 the demand is what we need to do is figure out ways to
12 enhance, advance, and expand those programs rather than,
13 you know, I feel like the State is very excited about
14 developing shiny new things. But the fact is we have a lot
15 of things on the ground that we know work very well, but
16 they're just expensive and hard to do. So, it's really
17 trying to figure out to get in the same place to say, these
18 are our goals together which I'm, you know, excited to see
19 in the barrier study but also we know how to execute and
20 implement these goals in some ways. We know what that
21 looks like and on the workforce side that looks like some
22 of these training programs that we're talking about and how
23 do we put money into building those pathways rather than

1 setting up separate pathways, you know, so that every --
2 every agency has their own idea of workforce programs;
3 right?

4 That there's a way that we see this as an
5 integrated system of workforce rather than a set of
6 discrete investments. I think that's what I would like to
7 see and, I think, that's back to this question you've heard
8 some things and whether it is the kind of pathways that
9 Ross was just mentioning or the kind of work that Melvin's
10 doing or the kind of work in the -- in Santa Clara that
11 John was talking about. That just to remind you that there
12 are fantastic strides being made to address this but it's a
13 matter of bringing it together and bringing it to scale.

14 MR. MCALLISTER: I want to chime in a little bit.
15 I've been listening. I missed it so I don't know what was
16 said too much in the beginning of the panel. But I'd -- I
17 wanted to just chime in.

18 I hear Carol and, I think, you know, we all -- we
19 know that quality matters. I mean buildings are -- they
20 are systems, so we have to make sure that they function,
21 right, and there's a lot of knowledge that's required to do
22 that. You've got to know how to work with your hands,
23 you've got to know the theory, you've got to know a lot of

1 stuff to make a building work properly, and that's in new
2 construction and retrofits, really more so in retrofits.

3 And, so, the trades really they're getting their
4 hands on these buildings, you know, and it's residential
5 and commercial I think a lot of, you know, they're
6 different. But, you know, we tend to sort of automatically
7 think of residential and the low-income setting, right, but
8 really a lot of the savings are in the commercial side.
9 And there's a lot of technology available. We have
10 incredible technology.

11 And, I think, as building performance moves front
12 and center, which it has to, then that puts -- it makes it
13 even more critical and I think obvious that the quality of
14 the workforce that's working on these buildings is, you
15 know, we just -- we can't do the race at the bottom. We've
16 got to make sure that there's a minimum standard.

17 So, you know, I think that is becoming clearer
18 and clearer and, you know, you've all been thinking about
19 this is a long time and I really appreciate the panel.

20 And I guess, I wonder if there's anything more to
21 say about utilizing the low-income weatherization programs
22 or these sort of specific programs that are focused on
23 serving these populations and kind of trying to solve the

1 [indiscernible] problem, you know, how do we use those as
2 launching pads to get over to into main -- into train the
3 people implementing those programs that they get over into
4 the mainstream workforce and sort of that is their entry.
5 You know, we had a little conversation a little bit ago
6 about what's the gateway and, you know, how do we -- I
7 think DWP was a good example that you gave because they
8 have everything under one house, you know, so they can kind
9 of do that, they can start here and move people around and
10 give them the experience.

11 In the IOU context, what crosswalks do you see to
12 be able to kind of take the contractor approach, you know,
13 third party implementer approach and create, make that
14 little petri dish for job development and then help those
15 people move into mainstream jobs, energy related jobs.

16 MR. NAKASONE: Can I jump in first, if that's
17 okay.

18 MS. WHITE: Sure.

19 MR. NAKASONE: This actually was sort of a
20 discussion point I know during this [indiscernible] barrier
21 study development -- workshop study development itself.
22 And I would want to encourage you to think about for
23 low-income communities and communities of color receiving

1 energy efficiency services is super important. Where they
2 get jobs and how they can benefit economically from, you
3 know, clean jobs, green jobs, energy efficiency work does
4 not need to be limited to ESAP [indiscernible] that, in
5 fact, the mainstream general energy efficiency programs are
6 in entirely untapped job opportunity for communities of
7 color. And I would encourage the commission to think
8 broadly about that rather than saying, well, we're talking
9 about disadvantage communities so we should only be talking
10 about jobs from ESAP.

11 MR. MCALLISTER: Well, that's kind of my point;
12 right? I mean, that's sort of the definition of
13 [indiscernible], I think, so. So, I guess, you know, how
14 do we do that. What's the implementation look like for
15 that I guess is part of my question.

16 MS. ZABIN: Well, I completely, completely agree
17 with Ross that we should not limit to these weatherization
18 jobs because they are -- the way they're structured now
19 they're dead-end jobs. So, when we have new money or when
20 we're willing to really restructure those programs, we can.
21 And we can, I mean, the best way I think is through
22 communities benefit agreements where we aggregate a lot of
23 these little jobs and offer them to contractors who meet

1 certain responsible contractor standards, who have wage
2 floors, and health and safety standards, and who -- and who
3 are already participating in apprenticeship who are already
4 investing big bucks for every hour of every employee
5 worked, on both the worker side and the employer side.
6 What is it like a \$100 million per year in the state of
7 private money that's going into apprenticeship industry
8 money. There's no reason why that -- any of the energy
9 efficiency work couldn't be structured that way. And I
10 think what we would see is the development of paths
11 where -- and Johnny could -- Johnny Simpson could talk
12 about this more, but we see this in utilities scale solar
13 where the trades have created essentially a pre-apprentice
14 job classification, often called construction wireman,
15 which is the lowest skill of, you know, putting the panels
16 together, and have provided entry level employment for
17 many, many people. But it has a standard on it. It's not a
18 \$12 an hour job. It's a twenty-three -- when I talked to
19 the Bakersfield guys it's a \$23 an hour entry level job,
20 and it has the opportunity to then give people the
21 experience to successfully apply to apprenticeship. That
22 same kind of structure could work in energy efficiency.
23 The reason it works in solar is because those project

1 utility scale do have project labor agreements that trades
2 are involved, the apprenticeship system is implicated from
3 day one. And so things happen because there's a structure
4 and an architecture in place. And I don't think we can't
5 really twist those weatherization programs every easily. I
6 mean Rising Sun has done an amazing job of reformulating
7 and becoming a pre-apprenticeship because they saw, and I
8 just want to reiterate what Melvin said, is those
9 weatherization jobs were dead-end and so they didn't want
10 to devote their mission driven training organization to
11 dead-end jobs. So they moved and have reoriented their pre-
12 apprenticeship to they can get somebody into the sheet
13 metal apprenticeship program which takes, you know, a level
14 of math and a level of familiarity with the tools, et
15 cetera. So.

16 MR. MCALLISTER: So, I guess, just to be clear
17 what you're saying is: when the structure of
18 implementation, to the extent that we're talking about
19 weatherization. I know it's a broader conversation than
20 that and the workforce can be -- ought to be fungible
21 across all these fronts; right. But to the extent that
22 there's a lot of money being dedicated to low-income
23 weatherization, then when those programs get reformulated,

1 refunded, you know, re-examined through some process that
2 those criteria ought to be part of the discussion and
3 applied.

4 MS. ZABIN: Right. So that you could attract
5 contractors who are already involved in apprenticeship.

6 MR. MCALLISTER: Yeah.

7 MS. ZABIN: Bid on those programs and be able to
8 compete with the contractors that currently get them which
9 don't have that structure, not that they're bad intentioned
10 or, you know, not that they're at all, you know --

11 MR. MCALLISTER: Absolutely.

12 MS. ZABIN: But they don't -- they're not in that
13 structure that actually has good outcomes.

14 MR. MCALLISTER: Yeah, I would say -- and I don't
15 know if you want to talk about it. But four years ago --

16 MR. WEISENMILLER: We're going to move on to the
17 next one.

18 MR. MCALLISTER: Okay.

19 MR. WEISENMILLER: Next topic -- sorry, Heather's
20 been trying to, you know.

21 MR. BRAUER: The only thing I would say really
22 quickly is the State Workforce Board, the Green Colors Job
23 Council, of which Carol chaired and I was on, we passed

1 some basic elements around structuring energy efficiency,
2 renewable other things that I would suggest you look at and
3 rely on the workforce board and ETP and the industry to
4 help meet the standards, both on the contractor's side and
5 frankly on the job quality side.

6 MR. WEISENMILLER: As we're moving, I would
7 remind everyone that President Picker and I are having an
8 event on Friday looking at some of the changes in the
9 industry which could be pretty sweeping in some of these
10 areas and terms of impacts on utilities relative to the
11 clean tech industry.

12 MS. ZABIN: Right.

13 MR. WEISNEMILLER: Which have much different
14 labor ethics, shall we say. Right, anyway.

15 MS. ZABIN: Right, yeah. And how do we retain
16 the innovation but not deregulate so completely that we
17 lose our social contract?

18 MS. RAITT: Well, thank you. It's been a really
19 good conversation. But we do need to move on to our last
20 panel of the day.

21 The next panel is on innovative clean energy
22 financing pilots for low-income customers. And if the

1 panelists could go ahead and come to the table, we'll have
2 places for you. Thank you, again, to our previous panel.

3 Our moderator is Deana Carrillo.

4 MS. CARRILLO: Good afternoon, everybody. We are
5 lucky to be your last panel today at 4 o'clock. So, I have
6 about thirty minutes of open remarks and then -- no, I'm
7 kidding. We will try to keep this short and brief but very
8 content driven, and we have a lot of interesting
9 contributors here today. So, I'm very excited to hear what
10 they have to say.

11 My name is Deana Carrillo. Good Afternoon.
12 Welcome to the finance panel of today's workshop. I'm the
13 executive director of the California Alternative Energy and
14 Advanced Transportation Financing Authority, and we're
15 housed in the treasurer's office, and our niche is working
16 with private capital providers to help meet public goals.
17 And we have had history of working with both the energy
18 commission and the PUC and a few different programs.

19 We have a very interesting panel -- group of
20 panelists with us today. So, I am going to keep my
21 introductory remarks short. I was asked to talk about
22 financing program that we are running today. And just for
23 the sake -- we're going to provide a quick overview of the

1 recommendation in the Barriers Report and then really
2 launch into what programs exist today, what challenges
3 folks are facing, and what different solutions they've
4 identified. I think there's a few different financing
5 structures that will be highlighted in today's panel and
6 then I have also been asked to give a brief presentation of
7 one of the pilots that we're running on behalf of the PUC.

8 Who -- for those in the room, who feels really
9 comfortable talking about financing or who would like --
10 no, okay.

11 So, why financing. Let's start there. So,
12 rebates and incentives alone and taxpayer dollars or
13 [indiscernible] payer dollars aren't going to get us to our
14 goals. There is about an \$80 billion need in building
15 retrofits in California when you look at our building stock
16 in Title 24. The need is great. And as I mentioned, we
17 can't do it on taxpayer dollar alone. So, we need some
18 creative market solutions, and really a public private
19 partnership to address financing in general in this market.

20 I've been focusing predominantly on energy
21 efficiency lately, whether it's renewables or EE or water.
22 And also, that public side has to be there to -- especially
23 to get to that low, moderate income market.

1 So, this is a slide that I borrowed from a
2 presentation by the World Bank in 2015, and it offers a
3 continuum of the different types of financing products out
4 there. And if you start at the bottom up, we would start
5 with free installation, grants, rebates, subsidies, these
6 are the highest, kind of public interest, public subsidized
7 types of financing. And then maybe you get into budget
8 financing or grants with co-financings or on-bill financing
9 with the utilities, revolving loan funds. And as you work
10 your way up this ladder you get to private market financing
11 aggregation and securitization.

12 A lot of folks talk to me about, well, have these
13 funds been securitized? Have we really mobilized that
14 secondary market? Because when we talk about financing
15 that's kind of -- that's really at the industry adoption of
16 growth and scale. That isn't easy to say when you talk
17 about low-income barriers.

18 So, in the study there are four recommendations.
19 One, is for the PUC to consider tariffed on-bill pilots,
20 and we'll be talking a little bit about that today from one
21 of our panelists. Two of the recommendations were for the
22 legislature to consider authorizing low-income customers
23 the option to use care, which I'm excited to learn more

1 about today. And, also, potentially for the State to adopt
2 credit enhancement or risk sharing to address market rate,
3 low income multifamily housing, or across all industries in
4 our disadvantage communities. The fourth was that the
5 State should explore a social impact bonds. So, there's a
6 quick little overview.

7 Before we launch into the presentations by the
8 panelists, again, one of CAPFA's roles right now is to help
9 administrator the California HUB for Energy Efficiency
10 Financing. This program has been under development for a
11 few years. We're working on launching sequentially as we
12 speak. And I'm just going to take a few minutes to talk
13 about what we're doing and how we're leveraging private
14 capital here.

15 In 2013, the PUC approved \$75 million in funding
16 to development the California HUB for Energy Efficiency
17 Financing. It's a collaborative public private partnership
18 established to get more capital providers into the energy
19 efficiency market and lower the costs and expand access to
20 financing. Really removing that barrier, that upfront
21 barrier for energy efficiency retrofits. Once developed
22 it'll cross industries for the single family, affordable
23 multifamily, and commercial markets. It offers a credit

1 enhancement for a specific industries and populations. And
2 on-bill repayment functionality with our foreign investor
3 owned utilities. A \$10 million statewide marketing
4 campaign for both lenders and contractors.

5 This provides an overview of the residential
6 pilots that we are launching, there's two with a sub-pilot.
7 The first is the Residential Energy Efficiency Loan
8 Program, this is our single-family program. We are
9 supporting loans and retail installment contracts up to
10 \$50,000, which is pretty high for just EE. It's off-bill.
11 We have about \$25 million in credit enhancement. Loans can
12 be provided to the tenant or the owner. Although a tenant
13 hasn't come in for a loan yet but the possibility is there.
14 And 70 percent of the loan goes to energy efficiency, 30
15 percent can go to other types of improvements.

16 We know that EE alone doesn't drive retrofits so
17 we want to be able to provide some flexibility to see if we
18 can get some more activity in scale. It is available in
19 the IOU service territories. It was launched last summer.
20 We're in a very slow uptake right now. I would say last
21 month the PUC issued a decision that allowed us to provide
22 a lot more flexibility into this program. So, we're really
23 excited about being able to remove some silos that exist

1 whenever you deal with [indiscernible] funds. And really
2 get leverage these pilots. We're excited what these pilots
3 can be, but it's been a long road to get to where we are.

4 The other residential pilot we have is for master
5 metered affordable multifamily. In this pilot we'll be
6 supporting loans, leases, and energy service agreements.
7 An energy service agreement is just like a PPA, or a power
8 purchase agreement, where you're buying a service and
9 you're not going into debt. So, for some business models
10 it works better, especially in the affordable multifamily
11 world where with low-income housing tax credits, debt is a
12 challenge.

13 We also have two commercial pilots. One is
14 targeted for small business with a credit enhancement, both
15 a nonbill and an off-bill option. And then we're providing
16 on-bill repayment for other types of projects.

17 So how are we trying to meet the low-income
18 market? On the residential side where specific to our
19 single family program, a third of the credit enhancement
20 funds are targeted to low-moderate income, lenders are
21 providing expanded loan terms. So they're lowering their
22 interest rates, they're broadening their underwriting
23 criteria, they're expanding their terms. So instead of a

1 one year unsecured loan, they're now offering a five-year
2 or a ten-year unsecured loan, which lowers the monthly
3 payments over time and makes the debt easier to absorb into
4 your monthly budget.

5 We're also offering bill payment history as an
6 alternative underwriting criteria. We're allowing single
7 measures. So we're meeting the borrower where they are.
8 We're not making this restrictive to whole house energy
9 efficiency retrofits. There's no audit requirements.
10 We're actually looking to expand to go to code because of
11 all that orphaned energy efficiency out there and given
12 where the states going.

13 And so we're very excited about some of these
14 innovative structures that we're able to do. We're
15 allowing financing for renters and mobile homeowners. And
16 there's a consumer protection element in the contractor
17 network, and the fact that -- well this is open market,
18 which means that a number of different lenders can
19 participate. We're not just choosing one lender. We're
20 trying to get as many lenders involved as possible. But
21 these are typically regulated financial entities, credit
22 unions, CDFI's, and then we're capping interest rates.

1 We are looking at some modifications given the
2 PUC's recent decision. We're very excited about that. So
3 for a single family program, because this is the one that's
4 launched, again, the first loan was enrolled in July. We
5 have over a hundred contractors engaged, we have four
6 credit unions participating, two are offering product
7 statewide. Again, you'll see here the loan terms are
8 extended so that means lower monthly payments. The amount
9 the borrower can borrow has increased because of the
10 state's absorption of that risk with the lost reserve.
11 Many of the credit unions have lowered their FICO score
12 requirements, and we've seen a rate reduction of up to 640
13 basis points which -- and in nonfinance speak is 6.4
14 percent.

15 Over a dozen loans have been enrolled today. I'm
16 not excited about that number, but with these changes we'll
17 get some higher activity. 20 percent of those have been
18 low-moderate income. Consumer marketing has yet to begin.

19 On the affordable multifamily sector, these units
20 are restricted to at least 50 percent deed restricted for
21 affordable housing. So we're looking at the HCD, HUD, low-
22 income tax credit projects. We're supporting structures
23 that allow for the off-balance sheet financing, which I

1 mentioned earlier. And, then, because this program is set
2 to leverage the IOU processes and infrastructure, we're
3 developing a technical assistance support for the building
4 owners to leverage the IOUs.

5 So that's my quick overview of the chief and now
6 we get to hear from our panelists. I did pull together
7 some questions for the panel, and as I kind of get settled,
8 I think the best way to move forward is maybe for everyone
9 to take five minutes in order to introduce yourself, talk a
10 little bit about how you're addressing these challenges to
11 the extent that you can address some of the strategies
12 within that five minutes, great. and then we'll just open
13 it up for Q and A.

14 Does that work for folks? Okay.

15 Al, you first.

16 MR. GASPARI: Hi, thank you. Al Gaspari from
17 PG&E. I'm the manager of our residential and transaction
18 services programs in the energy efficiency portfolio, which
19 includes all the financing programs.

20 So, let me just start by what we're doing in
21 terms of our work because we work closely with Deana and
22 her team on the OPR and the pilot work. We also oversee
23 all the financing offers and we call ourselves transaction

1 services because our goal is not to place debt with people.
2 It's to help people overcome the first cost barrier to
3 making energy efficiency and other clean energy
4 investments.

5 So, we look at a number of different strategies
6 for helping our programs to help customers overcome that.
7 At the end day for PG&E's perspective we don't, you know,
8 particularly want to place like one particular type of debt
9 or one solution with customers. We want to help them make
10 investments in energy efficiency that works best for them.

11 So, we do run the OBF program, which when you
12 think about for a small business customers that works very
13 well. That's where PG&E operates a revolving fund of
14 [indiscernible] dollars. It's available for small business
15 and other nonresidential customers. Probably 67 to 60 -- or
16 70 percent or so of our loans, by number of loans, go to
17 small businesses and, you know, what we hear that the real
18 value to them there is its zero interest, which is
19 obviously attractive. But we use alternative underwriting,
20 where we look at the utility bill payment history and
21 they're time as a utility customer to do the underwriting.
22 And we don't place any security interest on either the --
23 either the equipment or the facilities. So these are small

1 business owners that might have to go out and get equity on
2 their home, but we're going at it a different route where
3 we attach to the utility bill is disconnectable charge but
4 it does solve some problems there.

5 So, in the OPR and the pilot functionality we're
6 really excited about the EFLICK program, which is going to
7 be a residential on the bill offering for customers. And
8 why we're excited about that is we think that the payment
9 plan option, which could be up to about \$2,000 is a really
10 unique opportunity. So, you have a lot of technologies
11 that are coming on for customers and this could be anything
12 from smart -- some of the energy management technologies,
13 to even like weatherization and other like high impact
14 things that are up to \$2,000. So that's not really like
15 being served by PACE or even unsecured lending because it's
16 very small. But it can become a first cost barrier to
17 customers. So we think that by allowing them to be repaid
18 on the PG&E bill that will help to -- improve access to
19 customers and also because customers are used to doing
20 business with us, when they see us we think that it will
21 help to lower opportunity costs there. And that covers all
22 sectors and we're working hard to get vendors the support
23 for small businesses and low income customers.

1 In terms of, you know, overall work you know we
2 really focus on coordination with all of our programs. So
3 in the residential sector we coordinate with our ESA team
4 on the low-income side, our rates team, and all of our CES
5 programs to make sure that our offerings are integrated.
6 And this would be for multifamily buildings where we're
7 targeting the owners with OBF. We have an expanded OBF
8 capacity for multifamily buildings now we can go up to ten
9 years and up to \$2 million potentially for multifamily
10 buildings that are for low-income people. We're also
11 working with, you know, different programs for direct
12 install and where we can offer by really targeting
13 financing options especially at our market rate options.
14 We're able to expand the availability of our direct install
15 programs to more -- more customers, which allows us to
16 serve more moderate and low-income customers there. We're
17 also looking at the feasibility of some of the tariff
18 financing solutions that are available. So, we have a team
19 of accountants and, you know, we work with our lawyers
20 because what we want to do is come up with something that
21 is feasible from, you know, a regulatory legal and from a
22 customer perspective to really help to overcome the
23 first -- the first cost barrier that the customers have.

1 So there's a lot of analysis that has to go on because the
2 potential laws that impact it are not just in California
3 they go out to -- there's, you know, U.S. bankruptcy laws
4 and other lending laws that have to be complied with. So
5 you have to design something that's going to work for
6 customers. So there.

7 MR. WYNNE: Thank you. My name is Justin Wynne.
8 I'm here on behalf of the California Municipal Utilities
9 Association. I think my role here today is to give the POU
10 perspective on these different programs. I think one of
11 the things that was discussed earlier is that POU's really
12 value flexibility and I think it's really important that
13 they're able to tailor their programs for the unique
14 characteristics -- the unique characteristics of the
15 communities that they're serving.

16 And that's particularly true for low-income
17 programs, because if you look at the wide diversity among
18 POU's, you could look at, for example, some POU's have low
19 that's almost entirely commercial or industrial. Other
20 POU's are serving communities where the poverty rate is
21 double what the statewide average is and so between these
22 different POU's they're going to need very different
23 programs to effectively serve their communities.

1 Another high level comment is that I think POU's
2 generally view energy efficiency as a customer service and
3 I think that affects when they're looking at the success of
4 a program, particularly as it relates to cost
5 effectiveness, I think they're going to have a different
6 perspective than maybe the IOUs or when others are looking
7 at energy efficiency programs.

8 As I was talking to the POU's about these
9 financing options and low income programs, I think across
10 the board what I heard is that the POU's right now are re-
11 evaluating all their programs to make sure they're
12 effectively providing services and benefits to low-income
13 customers. And part of that is reconsidering whether
14 there's financing options that could be targeted towards
15 low income customers.

16 SMUD not surprisingly re-evaluating and looking
17 at some of the financing options. NTPA is preparing to go
18 out with a solicitation, looking for proposals on financing
19 for energy efficiency and that would partially affect low-
20 income programs.

21 As far as what POU's are actually doing right now
22 on financing related to energy efficiency ,I think very few
23 POU's have programs that they're running that's providing

1 that type of financing. SMUD has a program that has existed
2 for quite a long time. I think it provides up to \$30,000 of
3 benefit, there's a 15-year repayment, and I think the
4 current rate is 6.99 percent and there's differences on
5 what you can get and the different rates based off of its
6 secured and then the types of home. That program isn't
7 targeted at low-income, as a homeowner component
8 requirement, and it also has certain credit requirements
9 and I don't think the intent was ever for that to be the
10 primary low income program. There are obviously -- SMUD
11 has a wide variety of programs that are targeted at low-
12 income and very aggressive for like deep energy efficiency
13 retrofits and things like that.

14 The city of Lodi does have an on-bill financing
15 program but that's limited to commercial and industrial and
16 so it's also not targeted at low income. So I think the
17 main thing the POU's are doing on low-income programs, one
18 of the biggest programs, obviously, is just rate discounts
19 and so the majority of the POU's and I think the biggest
20 dollars are going towards directly reducing rates. that is
21 very clear. It's very straightforward. It's very popular.
22 And so I think when the POU's are looking at some of these

1 other programs, they're evaluating it against just the very
2 straightforward rate discount.

3 Specific to energy efficiency I think the biggest
4 thing would be the weatherization and direct install
5 programs. A large number of the POUs have these programs
6 they're either income limited or they've been designed with
7 low income customers in mind. And they do things like
8 HVAC, refrigerator replacement, windows and -- I think one
9 of the appeals of the direct install is that it's very
10 simple and it's easy for the customer to understand. And
11 in a lot of the cases when I've been talking to the
12 utilities they basically do everything for the customer. So
13 all the customer does is fill out the application, the
14 Utility sets up the installation, they do the auditing,
15 they do the inspection, make sure the installation was done
16 correctly, and then it's also, because it's no cost, it's
17 available to a much broader range of customers. And, so,
18 when, I think, when the utilities are considering some of
19 these other options I think the direct install is sort of
20 what they're measuring that against.

21 One of the other things is that it's been very
22 successful through the direct install, partnering with
23 other entities and so they've -- I think one of the more

1 common is that they work with the local gas, PG&E, or So
2 Cal Gas, and then also local nonprofits and then other
3 local governments and so they're doing one combined audit,
4 one combined installation. And so that's been a very
5 effective -- it seems that's pretty consistent among the
6 POU's is that they've focused on leveraging with other
7 programs.

8 One of the other things I heard is that because
9 of the direct installs customizable so they can - each
10 utility can look at its customer base and pick a menu of
11 different options that are best suited to its community.
12 It's helped make the direct install very successful for
13 them.

14 So I do have -- I've got a lot of input from the
15 POU's about on-bill financing specifically, but I assumed we
16 will talk about that in a subsequent part of the --

17 MS. CARILLO: Yeah.

18 MR. WYNNE: Okay.

19 MS. CARILLO: Let's see if we can get to those
20 questions. Thanks, Justin.

21 Stephanie.

22 MS. WANG: Sure. Hi, I'm Steph Wang. I'm the
23 policy director of the California Housing Partnership.

1 We're a nonprofit organization that was created to help
2 come up with financial solutions for creating and
3 preserving affordable housing for the long term, working
4 with nonprofit affordable housing organizations. And I run
5 our sustainable housing program that focuses on how can we
6 help to bring clean energy, energy efficiency, and
7 sustainable water resources to affordable housing.

8 I'm really excited about some of the
9 opportunities that we've been talking about today. When Al
10 was talking about on-bill financing and increasing the --
11 changing the terms of ten years, increasing the limits to 2
12 million, that's -- for us, we think that that's going to be
13 a really promising solution for multifamily affordable
14 housing. And, in fact, in anything, what we're concerned
15 about is that generally we get in the regulatory
16 proceedings we get authorization for the -- for utilities
17 to expand -- investors and utilities to expand the -- to
18 use the program for energy efficiency and perhaps specific
19 energy efficiency measures and not at the same time for
20 solar or demand response or energy storage.

21 I think when we were looking earlier at Deana's
22 presentation we saw, okay, so we can -- the multifamily
23 pilot for on-bill repayment, a different program, includes

1 energy efficiency and solar, hot water but not distributed
2 generation; right?

3 And so we end up in these situations where when
4 you're thinking from -- from a low income -- when you're
5 thinking from low income property prospective of, you know,
6 how do we reduce these utility bills and help to long-term
7 preserve the affordability and health of this housing, you
8 don't think in terms of like, oh, well, I really wanted
9 these specific energy efficiency measures. You think in
10 terms of what was the overall project I wanted to do that
11 was going to be best suited for this particular location
12 and how can we, you know, cobble together all of the
13 incentives from all the different state and local programs,
14 and then what gaps do we have left that we would need to
15 use financing for.

16 And a lot of times we'll have a financing program
17 that's designed, not to fill in the overall gaps for a
18 comprehensive project, but instead for -- to supplement a
19 very specific program. so it would be ,well, you can use
20 this financing specifically for certain energy efficiency
21 measures or specifically for, in theory, solar or something
22 like that. When really what you wanted was not necessarily
23 granted, the incentives may not completely cover each of

1 those measures, but at the same time that you had other
2 costs too and you wanted to do a broader project that was
3 beneficial for low income renters.

4 And so, you know, I'm really hoping that this is
5 a great opportunity that where the agencies are going to
6 work together and be thinking about financing, you know,
7 take a step back from the individual programs that, you
8 know, we may have -- that we're authorizing individually
9 and think about how does financing fill gaps and work with
10 the various programs instead.

11 And similarly I wanted to think about when we
12 think about the individual, like what offerings we need for
13 multifamily affordable housing, you know, I think it made a
14 lot of sense as Deana was talking about, you know, other
15 solutions like energy services agreements and leases, you
16 know, other options. but a lot of times we find that what
17 products may be available are for, you know, the more low
18 hanging fruit, not the whole building retrofit.

19 Again, a lot of what we hear from owners is, you
20 know, the hard stuff is what they need the financing for,
21 they need for the really deep retrofits, for the combined
22 projects and not, you know, not for the light bulb swap
23 outs or their toilet swap outs; right?

1 And, so, how do we make sure, you know, how do we
2 spur our marketplace for these deeper retrofit products
3 because otherwise it's just -- that's not going to be a
4 solution for mitigating the risk. Because the reason why
5 those -- some of those other products are interesting is
6 because it's very difficult for, not only for multifamily
7 but for housing owners to take on secured debt, but also
8 it's really difficult for them to take any risk that
9 they're going to have to pay back on what -- I'm not going
10 to call it a loan because it's not debt. But even their
11 other forms of financing, if there's -- if they don't have
12 a lot of assurance that they're going to get the utility
13 bill savings that was projected, as projected performance;
14 right?

15 And each of these affordable housing owners
16 they're main job is not, you know, being really excellent
17 at ensuring that energy efficiency savings are going to
18 materialize and ensuring that all of their tenants are
19 going to be really great at the performance.

20 So, you know, how do we spur these other
21 opportunities. and I think I'm going to leave it at that.

22 MS. CARILLO: Great. Thank you, Stephanie.

23 Tammy.

1 MS. AGARD: Good afternoon. I may be the only
2 person who came in today from Arkansas. I'm thinking that
3 might be the case.

4 But my name is Tammy Agard, and I am President of
5 a benefit corporation in Arkansas that serves as a program
6 operator for energy efficiency financing programs in under
7 states. I'm honored to be here today to contribute to
8 these action oriented deliberations about implementing the
9 CEC's recommendations in the barrier study, which as I
10 understand it suggests that every type of energy utility in
11 California, at least consider, introducing inclusive
12 financing through a tariff on-bill program. And that's
13 kind of what I'm here to talk about today and offer-up.

14 We agree whole heartedly with this recommendation
15 based on our experience as a program operator on the ground
16 in the Arkansas Southern delta region where we operated
17 both an on-bill loan program as well as an option tariff
18 program called Help Pays. To back up just a step, the home
19 energy lending programs are on bill offering, and the home
20 energy lending program Pays or Help Pays, is the same
21 program based on the same objectives and collaborations and
22 everything else that we built in the lending program but
23 with the op tan tariff as the financing mechanism.

1 Since the barrier study describes how inclusive
2 financing works through the option tariff just to
3 highlight. It basically allows the utility to invest in
4 any upgrade on the customer side of the meter as long as
5 those upgrades are cost effective and it allows the utility
6 to recover its costs with a charge on the bill that is
7 substantially less than the estimated savings.

8 The program design that we used in Arkansas is
9 based on the pay system, pay as you save system, which is
10 the same system used by utilities and approved by
11 commissions so far in states like Kansas, Kentucky,
12 Arkansas, North Carolina, and New Hampshire. I actually
13 understand that there are a few monies here in California
14 in the Byron counties area that have gained some experience
15 with the pay system as well.

16 So with that background, I'd like to offer up
17 three short points in support of your action plans for
18 implementation today. Number one, we built upon our
19 experience with our on-bill program as I mentioned in order
20 to introduce a more inclusive tariffed on bill program
21 because we were not able to reach the lower income
22 populations, particularly renters and multifamily, that we
23 really set out to reach. We just frankly were not getting

1 the participation levels that we wanted. And when we did
2 that, approximately just a little bit over a year ago, what
3 we found was explosive change. And by explosive, I mean,
4 our participation rates, when we switched the tariff,
5 increased times three. The investment utility per location
6 more than doubled, and that's largely due to the utilities
7 willingness to invest in HVAC equipment with the tariff
8 being used as a security as opposed to loan or credit
9 worthiness or debt, et cetera.

10 And some interesting news to report in particular
11 in some -- I won't -- I was only here for the last hour,
12 hour and a half or so you but I did hear quite a bit of
13 discussion around multifamily and renters, et cetera. And
14 one of the things it may be hard for people to believe in
15 this room but it's true is that although there are only 85
16 multifamily units in the Arkansas delta region where we
17 operate this program, one hundred percent have now been
18 retrofitted with deep energy efficiency upgrades, one
19 hundred percent of them, all renters said, absolutely, yes
20 to this option. All renters are experiencing \$15 to \$20 a
21 month in savings, while that's -- in addition to paying
22 back the tariff charge to the utility. While that's not a
23 tremendous amount, it is in the delta region where the

1 household median income is about \$29,000 a year. And the
2 units I'm talking about that we retrofitted rent for around
3 \$250 a month.

4 So, it's been an outstanding success and a just,
5 apples and elephants difference when we use the tariff
6 terms as opposed to the loan terms, otherwise it was the
7 same program. The second thing I want to offer up where I
8 think that potentially California can benefit, which by the
9 way California is my home state. Is the technical
10 assistance that is now available through the experience of
11 practitioners with experience in other states, and I
12 mentioned some of those a moment ago. But one in particular
13 Roanoke Electric Cooperative in North Carolina made --
14 basically essentially a ready-made resource for managers
15 following the CEC's recommendation to consider tariffed on-
16 bill for energy efficiency upgrades. And that's available
17 right now, and it's very well thought out tool I've used it
18 several times when utilities approached me about interest
19 in -- their interest in considering tariffed on-bill and
20 that's available just to the click of a button. Also the
21 Southeast Energy Efficiency Alliance otherwise known SEEA,
22 they now offer technical assistance programming for
23 stakeholders for states all across the country not just

1 limited to the southeast. In fact, there's an active
2 webinar right now all about inclusive financing that's
3 recorded and archived and ongoing.

4 And then, lastly, we're a tiny little program
5 operator in Arkansas, I have no aspirations to believe for
6 a second we would come out here to California; however, we
7 have managed to meet quite a lot of folks who have gotten
8 their elbows and knees dirty and kind of figured this out
9 and, you know, it's funny I have to say this but I am
10 saying it, is if we can figure out in the Arkansas delta,
11 my gosh, I'm positive you-all could figure this out here.

12 But anyway, having said that, we would be happy
13 to -- our company would be happy to assist program
14 operators here in California who are much, I'm sure,
15 equipped in resources, et cetera, to be able to, you know,
16 do this sort of a transfer. But we'd be happy to help
17 facilitate any of that. And, then, lastly, my last point
18 is that inclusive financing using a tariff, based in
19 particular on the pay system, which has tremendous consumer
20 protection pieces built in. One of the things Stephanie
21 mentioned a second ago was making sure that the person who
22 takes advantage of the offer actually does get the savings
23 that they're supposed to get. This is a critical component

1 of the pay system and I think probably the most critical
2 reason why we've been so successful is that it's a -- we
3 follow what's called an 80/20 rule, wherein, 80 percent of
4 the savings that the customer receives post-retrofit are
5 used to pay the utility back. Its cost recovery, but 20
6 percent of those savings stays in the member's pocket.
7 It's not an option not to go that route. So, therefore,
8 our contractors are performance based, they're paid for
9 targets, achieving those targets, targets are met.

10 And I'll leave it with one other point on that,
11 with regard to hearing a lot of the panel before I got
12 here, up here, talking about the jobs this is something
13 that we are seeing first-hand in the delta region, which
14 has been really, really motivating me quite a bit to see
15 that not only contractors, you know, with this kind of
16 level of scale and deeper impact comes more jobs and comes
17 actually even the ability for some folks who are blue
18 collar workers who came into this as much such to start
19 their own companies and grow and hire their neighbors,
20 which we are seeing -- we've got a company down there that
21 now has 11 employees and he started out, you know, doing
22 installation up in the attic now he owns his own company.

1 Literally retrofitting, you know, neighbors and family
2 members homes in his neighborhood.

3 But any rate, just in closing comments, I want to
4 point out that once again we were able to build upon what
5 we started. We didn't ditch all of the efforts and
6 everything that we put forth to create the loan program.
7 We just switched over to the tariff as a financing
8 mechanism and the success speaks for itself. I've got
9 handouts here. I'm happy to leave with you guys reports
10 online the difference that it made to our programs once we
11 launched the tariff. But as far as company, we are no
12 longer interested in operating on-bill loan programs
13 because of the success of the on-bill tariff. it's that
14 strong in our -- in our prospective looking forward.

15 So, I'm glad to be here and welcome to take any
16 questions you have later. Thank you.

17 MS. CARRILLO: Thank you, Tammy.

18 Erica.

19 MS. MCCONNELL: Thanks, Deana. And thanks so
20 much for the opportunity to be here on this panel. My name
21 is Erica McConnell. I'm an attorney with the law firm
22 Shute, Mihaly, and Wineberger, and here on behalf of the
23 Interstate Renewable Energy Council, IREC.

1 I'll just start by giving a little bit of context
2 to IREC's work in this space and then talk specifically
3 about our clean care proposal, which involves the
4 redirection of care funds into investments and renewable
5 energy. So, IREC, for those not familiar, is a 501C3,
6 independent national nonprofit organization whose goal is
7 to expand access to renewable energy, clean energy, and
8 energy efficiency to more energy consumers. IREC has a
9 regulatory program which is what I work on, also work on
10 workforce development and consumer protection. Within the
11 regulatory program, core focal areas include: community and
12 shared renewable energy, and that's really what the clean
13 care concept grew out of. But IREC also works on
14 interconnection, energy storage, and grid modernization.
15 Within that the shared renewable energy program area, you
16 know, in line with IREC's over-arching goal, the goal is to
17 expand access to renewable energy to all energy consumers,
18 that includes low-income energy consumers and those in
19 disadvantaged communities. And as part of our efforts in
20 that space IREC developed policy guidelines and model
21 provisions for low income shared renewable energy programs
22 about a year ago and really it looks a lot like the
23 barriers report but focuses on a particular area, community

1 solar. So we looked at the different barriers and at
2 potential solutions to those barriers to increasing access,
3 not surprisingly a lot of the big barriers are financial,
4 including access to capital and credit and so we identified
5 various solutions in place for community solar but also in
6 other spaces, like energy efficiency, like on bill
7 financing. And thought about, you know, how could those
8 maybe be applied in this context.

9 So clean care kind of fits into that piece of
10 IREC's work. it actually predates that report, however,
11 it's a concept that we'd been working on for about four
12 years now and really came out of looking at these community
13 solar programs and hearing people say, oh, those -- that's
14 the way that that low income people are going to get access
15 to renewable energy but not really seeing that happening in
16 practice. And so thinking about what are the tools that we
17 have that we could use to make this work. We're really
18 happy to see the clean care concept mentioned in the
19 Barriers Report and to make its way into the
20 recommendations because we think it is really an
21 interesting solution and promising solution to this
22 problem.

1 So the basic idea is that care for -- someone
2 from Arkansas or anyone else who might be listening, not
3 familiar with California, is the low income rate par-
4 assistance program here. the idea is that customers who
5 would be eligible for the care program would elect to
6 participate in clean care, they would move on to regular
7 rates, so they would leave behind their care rate subsidy
8 and that subsidy instead would be invested in a portfolio
9 of shared renewable energy facilities. So the customers on
10 a regular rate, their investment -- their subsidies
11 invested in those facilities and then to realize the bill
12 discount that's required by the care program they would
13 receive net metering credits that would be associated with
14 their proportionate share of that portfolio of generation.

15 So from the customer's perspective their bill
16 should look the same or potentially even lower then what it
17 would have looked like under the care program but instead
18 of via a rate discount. It would be via an electricity bill
19 credit. So from the customer's perspective the real goal
20 would be to make this simple and a choice that they would
21 make, they wouldn't have different providers marketing
22 things to them. There would be marketing and education to
23 make sure that they understood what was going on but a lot

1 of that administration would happen by the utilities and
2 potentially a third party administrator working together to
3 say, okay, this customer signed up for the program or
4 moving them to the regular rate and we're applying the
5 requisite number of bill credits onto their bill that their
6 share and that keeps their bill at that level or lower than
7 they would have received if they had stayed on the Care
8 rate.

9 You know, the real elegance we feel of this
10 proposal is that it relies on the existing Care funds and
11 it achieves that same Care mandate of bill discount but
12 also achieves some of these other goals connecting
13 customers with direct participation in renewable energy,
14 all the environmental benefits associated with that and
15 potentially, you know, the job benefits that could come
16 with market building in the sphere.

17 But it would require thinking differently about
18 the Care program and I think we're very sensitive to
19 touching the Care program. I mean, Care is a - is the envy
20 of many other states low-income advocates and other states
21 and it's something that other states look to. So certainly
22 that -- IREC has been working on this proposal with
23 environmental justice advocates, consumer advocates, the

1 solar industry, lots of stakeholders and that was a strong
2 message that we got is, you know, be very careful in
3 opening this door.

4 But at the same time, a lot of enthusiasm about
5 this idea, you know, if it works this could be a really
6 great way to use these same dollars to achieve a multiple
7 benefits on the -- I think it was the prior panel or maybe
8 earlier in the morning, somebody was talking about starting
9 small. So our idea here would be pilot this idea at first,
10 work out the kinks, and then potentially if it were working
11 well expand it. so start with a small number of megawatts
12 and a small number of customers, maybe the highest usage
13 customers and expand it from there.

14 As far as the status of Clean Care, it continues
15 to be a concept and not something that actually exists in
16 practice in California or anywhere else. IREC is purely a
17 regulatory actor. We don't do any legislative work. So
18 we've been working at the -- the PUC. Clean Care has been
19 under consideration in a few different dockets there and
20 has benefited from a lot of discussion. Within those
21 dockets it's been refined since it was first proposed. And
22 I would say IREC is very open to feedback and further
23 discussion on the concept that organization doesn't have

1 anything to gain from Clean Care. We really think it's an
2 interesting idea that could end up really benefitting a lot
3 of low-income people.

4 Like I said, this is still a concept. This is
5 not other states. We've heard lots of interest in other
6 states. I think this topic of financing for low-income
7 customers is cropping up in a lot of the leading -- we're
8 hearing a lot of discussion in New York on this topic. But
9 California historically has been on Care and a lot of
10 programs has poised to really be a leader here I think and
11 to continue that trend.

12 And, again, really the impotence here is to use
13 the existing Care funds in a way that it not only achieves
14 that bill relief, that those customers need, but also
15 potentially other goals. So that's the underlying gist of
16 it and I'll leave it there.

17 MR. WEISENMILLER: Yeah, I would, again. And
18 what I would tend to say is we tried in the barriers report
19 not to get into specific pending POU cases.

20 MS. MCCONNELL: Okay.

21 MR. WEISENMILLER: You know, basically -- the
22 basic measures in a way is to focus over there. You know,
23 obviously having worked with both Sylvia Segal and Lenny

1 Ross back in the 70's, you know, Care is an incredibly
2 important program in California that whatever we do we
3 can't screw up.

4 MS. MCCONNELL: Yes.

5 MS. CARRILLO: So, I've identified at least one
6 question and it might require -- and I don't know how much
7 time we have or if commissioners have any additional
8 questions.

9 But I would define -- just for the sake of the
10 folks in the room - there's three structures that have been
11 discussed -- well, several. There's on-bill repayment,
12 which means that there's a third-party lending to your
13 customer and it's getting paid on utility bill, there's on
14 bill financing where the utility is lending the money, all
15 though I think some may oppose that term lending given some
16 of the utility legal constraints in issues. But that's the
17 word I will use. And then there's Pays, which -- Tammy,
18 correct me if I'm wrong, it is when the utilities paying
19 for the installation and then the cost of that item gets
20 repaid on the utility bill based on savings?

21 MS. AGARD: Well, no, that's correct but it's
22 tied to the meter for security. So there's no loan or debt
23 or income check. There's no qualifier other than the --

1 MS. CARILLO: Right. And does it transfer with
2 the meter?

3 MS. AGARD: It transfers with the meter.

4 MS. CARILLO: It transfers with the meter?

5 MS. AGARD: Correct.

6 MS. CARILLO: So those are the three different
7 structures that have kind of risen to the top as well as
8 Care, which I'm still learning about. And I think we have
9 some very different experiences on the panel, with PG&E
10 having some good success on small business and expanding
11 terms for OBF, for multifamily. We haven't quite heard the
12 POU position on OBF or OBR. I wasn't quite sure which one
13 you had surveyed them with.

14 And, Tammy, I'd be interested in hearing a little
15 bit more about the shift in your experience of whether
16 utilities were doing OBF or OBR and, you know, with their
17 own capital and moving and what that decision was based on.

18 So I think we might have time -- this is
19 interesting to me.

20 MS. RAITT: Just a quick time check. We were
21 going to close the panel in about 10 minutes so.

22 MS. CARRILLO: Great. So speed answers.

23 MS. AGARD: Well, what specifically was the -

1 MS. CARRILLO: I think, let's start with the POU's
2 since you had it tasked up.

3 MR. GASPARI: Sure. So, I guess, just the -
4 initial comment is that when I was talking to the POU's
5 about the different financing options, I think, what I was
6 consistently hearing is the direct install program it's
7 successful, it's simple, and when they're looking at other
8 options they're comparing it to that. And so it's always
9 in reference to what the existing programs are and because
10 they will be competing against each other I think that's
11 sort of the consistent theme that I heard.

12 But for the on-bill financing options, one for
13 the top concerns is that for most POU's their billing system
14 doesn't accommodate it and they would need to upgrade their
15 billing system. And for some utilities that would be
16 millions of dollars. And just the decision, it's also just
17 changing your billing system is a very complex process
18 anyway. And so that's really a prohibitive barrier to
19 some. There's also the complexity with some of the
20 utilities that they -- if you're a municipality sometimes
21 you have multiple different utilities all a part of the
22 same bill. So you might have water, sewage, and other
23 things all in the same bill.

1 And there was questions about how on-bill
2 financing for energy efficiency project fits in that type
3 of billing structure.

4 And other problems like -- the understanding is
5 on-bill financing requires the bill to be issued on the
6 same day every month and some POU's have floating bill
7 dates. I don't know if that's --

8 MS. CARRILLO: They have. It's a challenge.

9 MR. GASPARI: Yeah, and so -- the thing is this
10 is a very narrow program, there's alternatives, and so are
11 you willing to do these massive changes to fit just the
12 single program. But the -- just the -- some of the larger
13 concerns are even if we can address those issues, there's
14 still the assumption that on-bill financing has relatively
15 high administrative costs compared to some of the other
16 options. And tied to that, there's the concern that due to
17 the complexity you might not have a high adoption rate.
18 And so you might have this more expensive program that less
19 customers are using. When those dollars could have been
20 spent for like a deep dive free program.

21 And, like, some of the input that I got, I think
22 the City of Needles mentioned that a significant portion of
23 their direct install participants, their annual income is

1 like \$11,000 a year or less. So, there, just don't believe
2 those customers is going to want to sign up for \$20,000
3 energy efficiency upgrade and take on all the risks
4 associated with that.

5 MS. CARRILLO: Right.

6 MR. GASPARI: Very last thing. Like when these
7 ideas have been presented there's just a fundamental
8 response from like boards and city councils that they don't
9 necessarily feel like the utilities should be in the
10 business of loaning to its customers. And so I think
11 there's just a discomfort at the elected official level
12 with taking on these obligations.

13 MS. CARRILLO: Got it.

14 So, Tammy, since you traveled the furthest, you
15 get extra time. I'm using my discretion because I think I
16 know what Al's going to say.

17 But maybe you can share what that shift to pays
18 looks like. I mean, I think the reason might be kind of
19 obvious, if people don't want to borrow at a certain
20 income, I mean, I think we need to think about our
21 population and who needs direct install and who we really
22 want to put into more debt.

1 MR. MCALLISTER: Can I actually layer a piece end
2 to this question too.

3 MS. CARRILLO: By all means.

4 MR. MCALLISTER: I am also interested in knowing
5 how you know what the savings outcomes have been and
6 whether it's at the, you know, probably not the specific
7 project level but at the portfolio level. What are you
8 doing to sort of say, hey, this is actually producing the
9 outcome that we're looking for in terms of energy.

10 MS. AGARD: Well, it actually is at a specific
11 house. Believe it or not we do --

12 MR. MCALLISTER: Could you explain all that,
13 yeah.

14 MS. AGARD: Yeah, sure. Where to start. Well,
15 I'll start with your question because you're sitting up
16 there and I'm down here. So I'm going to make sure that I
17 get that one. So what we do after the retrofit occurs is
18 on the actual day that the tentative work is scheduled to
19 be finished there's a call in for inspection where a
20 utility employed person, typically a lineman or a line
21 woman, is called over to do what we call a final inspection
22 where the contractor has set up a [indiscernible] pressure
23 pans, whatnot, for the service person to walk through the

1 home and inspect. It takes about 20 to 30 minutes, record
2 retrofit numbers, new [indiscernible], et cetera,
3 photograph and then upload the results.

4 And then smart meters is a great help that one of
5 the best pieces of our QC tool kit can really flag us if
6 we've got any kind of problem out there. But typically the
7 estimates that we give, the cost effectiveness analysis
8 estimates on the front end are fairly conservative
9 purposely. We cannot put a participant in a cash flow even
10 neutral position when we're promising energy savings. And
11 so we take that very seriously and our contractors, again,
12 are paid for performance paid for results. There's
13 consequences to them if they don't achieve those targets.

14 Did that answer your question?

15 MR. MCALLISTER: Yeah, for the most part.
16 Instead of digging deeper, maybe we'll let you answer
17 Deana's part of the question.

18 MS. AGARD: Okay. So to your part of the
19 question, how did we sort of go from on-bill loan --

20 MS. CARRILLO: Yeah.

21 MS. AGARD: -- or on-bill -- So this -- it's kind
22 of a hokey story, but I'm here and, I guess, I might as
23 well tell it. This Rural Electric Cooperative has a

1 general manager by the name of Mark Casey. The Rural
2 Electric Cooperative is called [indiscernible] Electric
3 Cooperative and it's in the Arkansas delta region. And I
4 got a call up from Mark Casey one day asking if there was
5 anything that I could do -- my work at that time was with
6 the Clinton foundation in Little Rock, which is how I ended
7 up Arkansas. And if we could potentially help them with
8 some sort of on-bill financing solution to reach the lowest
9 income populations in the delta region, which they were
10 really not able to do much for, knowing full well,
11 potentially -- or particularly with the power plan and what
12 was coming on the horizon for Arkansas that already very,
13 very burdened members of the community were going to face
14 very real trouble in the near future.

15 And so he was desperate really to find a solution
16 that with would work. So we kind of put together what we
17 thought might help out with the on bill loan model and it
18 was to a point successful. I don't want to say it wasn't.
19 It was to a point successful but we were not able to reach
20 renters, much like what you said earlier, not many renters
21 want to make an investment in a landlord's property. I
22 mean, why on earth would they. An awful lot of folks were
23 versed to taking on debt especially when they were already

1 living in difficult circumstances and couldn't qualify for
2 any kind of loan.

3 So long story short, that wasn't acceptable.

4 Once we launched the on-bill loan program we were still
5 unable to reach those most vulnerable populations within
6 the delta region and so Mark was not done. And this was
7 about two years ago or so I had come across the idea of the
8 pays tariff, Ms. Holmes Hummel, Dr. Holmes Hummel, at a
9 convention and learned about the tariffed on-bill option
10 and just kind of took a deeper dive into it. Went back
11 home to Arkansas and told Mr. Casey about it and we
12 couldn't get on a call fast enough. And after he did his
13 due diligence and talked with his boards, it seemed quite
14 frankly a no brainer. So we switched over to file with the
15 public service commission, got unanimous approval. The
16 hardest part for the commission was to believe that we were
17 filing for a tariff to lower a utility bill, which was --
18 but there was precedent in the other states. So, anyway,
19 they unanimously approved it fairly quickly. We had
20 already had our on-bill financing loan program up and
21 running. So really, again, all it was switching over to
22 the tariff for the financing mechanism.

1 MS. CARRILLO: So I have one follow-up question,
2 unless there are others.

3 MS. RAITT: I'll also just mention that we are at
4 4:15. I'm sorry. I know this is an interesting
5 conversation.

6 MS. CARRILLO: I'll get to ask it afterwards.

7 MS. RAITT: Okay.

8 MS. SCOTT: Ms. Agard, you mentioned that you had
9 brought some handouts for us. So, if you could please make
10 sure that our team gets it or our public advisor, so we can
11 get it into the record. I think we'd all be interested in
12 seeing that.

13 MS. AGARD: I don't know who those people are.
14 But its right here, the whole pile.

15 MS. SCOTT: Thank you.

16 MS. AGARD: You're welcome.

17 And I'm going to be spending the night here and
18 flying out early in the morning, but if anybody would like
19 to visit afterwards -- I've only been on the ground for two
20 hours, so I've got plenty to give still, contribute if
21 folks find it helpful.

22 MR. WEISENMILLER: Thank you.

23 MS. RAITT: Thank you all very much.

1 MR. WEISENMILLER: Is there public comment?

2 MS. RAITT: Public comment? I don't know. I
3 don't have any blue cards but maybe somebody in the room
4 wanted to make comments and this hasn't -- hasn't gotten a
5 blue card to me yet.

6 If not, we can go ahead -- there is one person on
7 WebEx who would like to make comments.

8 MR. WEISENMILLER: Great.

9 MS. RAITT: So that is R. Bong Vergara. We'll
10 got ahead and unmute your line. If you're still there, go
11 ahead and make your comments.

12 MR. VERGARA: Thank you. My name is R. Bong
13 Vergara, and I comment on behalf of Conscious Youth
14 Promoting Health and Environmental Resilience or CYPHER for
15 short. CYPHER is a public interest incubator for the
16 grass-root CleanTech in developing and least developed
17 places. My comments are on following topics: how to
18 measure the impact of proposed regional service centers,
19 and how to link social equity to green [indiscernible]
20 option in low-income communities regarding the one-stop
21 shop, the proposed one-stop shop regional service centers
22 and the indicator system. I think that -- I think that in
23 planning the regional one-stop shop service centers and how

1 to measure their impact SP350 implementation. It would be
2 important to consider two things. Number one,
3 differentiate indicators from benchmarks. While indicators
4 tell us what is currently going on, benchmarks unify our
5 efforts towards a future targets state.

6 And I have a set of three recommendations as far
7 as the value of differentiating indicators from benchmarks.
8 Number one, a set of universal indicators should be
9 considered to assess what is going on in green
10 [indiscernible] option in low-income communities across the
11 State. Number two, community defined benchmarks should be
12 considered at the county and municipal level. And these
13 benchmarks should be directly related to broader state
14 level benchmarks on the green house [indiscernible]
15 reduction targets. Number three, these indicator and
16 benchmark systems should be Geo coded and available online
17 in the same way that census data is available online at the
18 aggregate and census track levels.

19 The second part of my comment on one-stop shop
20 has to do with ensuring that those indicator and benchmark
21 systems directly support climate resilience policymaking.
22 Both indicator and benchmark systems should facilitate
23 climate resilience from the start -- standard, top down

1 predict and prevent approach and also from a more bottom up
2 resilience building approach premised on promoting local
3 innovation.

4 There are three parts to this second part of my
5 comment. First, indicator should facilitate planning, and
6 benchmarks should condition investment. Number two,
7 indicators should facilitate planning, and benchmarks
8 should support and encourage local control of climate
9 resilience. Number three, indicators and benchmarks should
10 facilitate community engagement and by building resilience
11 at the nexus of regional scales, food, energy and water
12 systems in order to achieve two things. A, shore up hidden
13 vulnerabilities in the infrastructures and resources
14 supporting basic community needs in the era of climate
15 change specifically basic community needs of food, energy
16 and water.

17 MS. RAITT: I'm sorry to interrupt. But we will
18 need you to wrap up your comments, please. Thank you.

19 MR. VERGARA: Sure. And Number two, address
20 related system overlaps impacting both human and
21 [indiscernible] health. And finally, I think that social
22 work should be considered as a professional ail by CEC and
23 CPUC. There's a new framework now in the form of the

1 American Academy of Social work and Social Welfare grant
2 challenges through which social equity could be used as a
3 practical tool.

4 MR. WEISENMILLER: Okay. Thank you. We will
5 look forward to your written comments but at this point
6 we're going to need to move on.

7 MS. RAITT: Okay. I did get a blue card from
8 person who had to leave. So I can go ahead and read the
9 comment if you like.

10 It's from Celia V. Andrade, Director of Pacific
11 Asian Consortium in Employment. She wrote, thank you for
12 convening this workshop. We are mostly happy with the
13 general recommendations; however, we strongly recommend
14 that CBOs be appointed as members to the proposed task
15 force so they are actively involved in developing programs
16 in low income and DAC's.

17 MR. WEISENMILLER: Thanks. Heather, would you
18 remind people when comments -- written comments are due?

19 MS. RAITT: Yes. Written comments are due on
20 May 30th and all the information for how to do that is in
21 the notice.

22 MR. WEISENMILLER: Great. We're looking forward
23 to everyone's written comments, to give you an opportunity

REPORTER'S CERTIFICATE

I do hereby certify that the testimony in the foregoing hearing was taken at the time and place therein stated; that the testimony of said witnesses were reported by me, a certified electronic court reporter and a disinterested person, and was under my supervision thereafter transcribed into typewriting.

And I further certify that I am not of counsel or attorney for either or any of the parties to said hearing nor in any way interested in the outcome of the cause named in said caption.

IN WITNESS WHEREOF, I have hereunto set my hand this 30th day of May, 2017.
