

DOCKETED

Docket Number:	17-IEPR-01
Project Title:	General/Scope
TN #:	217923
Document Title:	Transcript of 05192017 Joint En Banc on Changing Nature of Consumer and Retail Choice in California
Description:	CPUC/CEC Joint En Banc was held at the Cal/EPA Headquarters Building.
Filer:	Cody Goldthrite
Organization:	California Energy Commission
Submitter Role:	Commission Staff
Submission Date:	6/7/2017 2:20:08 PM
Docketed Date:	6/7/2017

Joint En Banc Hearing)
_____)

JOINT EN BANC ON
CHANGING NATURE OF CONSUMER AND
RETAIL CHOICE IN CALIFORNIA

CAL/EPA HEADQUARTERS BUILDING
1001 I STREET
BYRON SHER AUDITORIUM
SACRAMENTO, CALIFORNIA

FRIDAY, MAY 19, 2017

8:45 A.M.

Reported By:
Gigi Lastra

APPEARANCES

JOINT AGENCY PARTICIPANTS

Michael J. Picker, California Public Utilities Commission
Robert Weisenmiller, California Energy Commission
Carla J. Peterman, California Public Utilities Commission
Liane M. Randolph, California Energy Commission
Martha Guzman Aceves, California Public Utilities
Commission
Andrew McAllister, California Energy Commission
Karen Douglas, California Energy Commission

STAFF:

Nick Chaset, California Public Utilities Commission

SPECIAL GUESTS:

Assemblymember Bill Quirk

PANEL PRESENTERS (* Via telephone and/or WebEx)

Panel Discussion - Agenda Item No. 3:

Ralph Cavanagh, Natural Resource Defense Council (NRDC)
(Panel Moderator)
Marcel Hawiger, The Utility Reform Network
(Presentation)
Strela Cervas, California Environmental Justice Alliance
Tim McRae, Silicon Valley Leadership Group
Mark Byron, University of California, Office of President
Nora Sheriff, Alcantar-Kahl Law representing California
Large Energy Consumers Association
Julien Gervreau, Jackson Family Wines

APPEARANCES (Cont.)

Panel Discussion - Agenda Item No. 4:

Sue Tierney, Analysis Group
 (Panel Moderator)
 Anne Hoskins, SunRun
 Geof Syphers, Sonoma Clean Energy
 (Presentation)
 Ron Perry, Commercial Energy
 Jeff Cramer, Coalition for Community Solar Access
 (Presentation)

Panel Discussion - Agenda Item No. 5:

Ren Orans, Energy and Environmental Economics, E3
 (Panel Moderator)
 Caroline Choi, Southern California Edison
 Steve Malnight, Pacific Gas and Electric Company
 Dan Skopec, Vice President, San Diego Gas & Electric

Panel Discussion - Agenda Item No. 6:

Jan Smutney-Jones, Independent Energy Producers Association
 (Panel Moderator)
 Sue Tierney, Analysis Group
 Ren Orans, E3
 Ralph Cavanagh, NRDC
 Jon Wellinghoff

PUBLIC SPEAKERS (* Via telephone and/or WebEx)

Aubrey Stone, California Black Chamber of Commerce
 John White, CEERT
 Jeanne Clinton, Self
 Julian Canete, California Asian Pacific Chamber of Commerce
 Rick Brow, TerraVerde Renewable Partners, LLC
 Craig Goodman, National Energy Marketers Association (NEM)
 Karey Christ-Janer, Self
 Edward Mainland, Self
 Doug Karpa, Clean Coalition

1 P R O C E E D I N G S

2 May 19, 2017

8:49 a.m.

3 PRESIDENT PICKER: So thank you for joining us
4 here at our en banc on customer retail choice. For those
5 of you who are not familiar with the nomenclature, this is
6 simply a way in which we can gather all the Commissioners,
7 in this case both from the California Public Utilities
8 Commission and from the California Energy Commission to
9 hear in public information that will help all of us to
10 understand perspectives on issues that are emergent or are
11 developing in California.

12 So for those of you who are in the Klamath Room,
13 the overflow room, there is additional space here in the
14 auditorium.

15 I want to thank all of you for joining us. I
16 want to thank all of our panelists. I want to thank both
17 my staff and the staff of the California Public Utility
18 Commission's Energy Division. I want to also acknowledge
19 the attendance of Assemblymember Bill Quirk, who skipped an
20 important day in his district to join us here today.

21 Just some housekeeping, in case of an emergency,
22 I will signal that there's an emergency. We leave through
23 the back doors, down the stairwell to my right, to your
24 left, and out the front the doors and across the street to
25 Cesar Chavez Park. I am a wilderness first responder, but

1 my ticket has expired, so you take your chances if you ask
2 me for first aid.

3 So I'll just kind of help frame the day a little
4 bit. And then ask for comments from my colleague and my
5 coworker, Bob Weisenmiller.

6 The reason that we here is that we're seeing
7 absolutely dramatic changes in California's electric
8 utility industry. Things that most people tell me are
9 absolutely unprecedented in the past 100 years, since the
10 industry first came in to being. And a lot of this is
11 brought about by a sequence of innovations and technology,
12 as well as many incremental policy actions that are taken
13 in several different decision making arenas.

14 Between rooftop solar, community choice
15 aggregators, direct access providers, the California Solar
16 Initiative, battery storage and other programs like the
17 Self Generator Incentive Program, or the single and
18 multiple family solar housing grant programs as much as 25
19 percent of investor owned utility retail electric load will
20 be effectively unbundled and served by either self-
21 generation or a non-IOU source or provider sometime later
22 this year.

23 That's another set of challenges that has crept
24 up on us. It's another set of developments. It's another
25 set of opportunities that we never really thought through

1 in a coherent way.

2 So this year is likely to grow quickly over the
3 coming decade, with some estimates that over 85 percent of
4 retail load served by sources other than the IOUs, the
5 investor owned utilities, by the middle of the 2020s.

6 So we've also set ourselves down a path to
7 fundamentally transform our energy and transportation
8 systems through deep carbonization. And that will in turn
9 will create a growth, equity and prosperity. But achieving
10 this 40 percent below 1990 GHG levels by 2030 will require
11 many tens of billions of dollars in the new infrastructure,
12 massive wind and solar farms, tens of thousands of electric
13 vehicle chargers, millions of EVs. And all of that
14 supported by a resilient, nimble and flexible grid that's
15 still being developed.

16 So a lot of this policy was predicated on a
17 system of centralized procurement, through three large
18 electric utilities and the local municipal utilities. And
19 that strategy for building a massive carbon reducing
20 infrastructure is being sundered. In 2000, we made
21 somewhat of a similar policy shift to disaggregated choice
22 of electricity providers in response to legislative
23 mandates. But this time, we're again moving forward
24 through a broad set of customer choice programs and we're
25 moving in that direction without that coherent plan to deal

1 with all the associated challenges that competition poses,
2 ranging from renewable procurement rules, to reliability
3 requirements, customer protection, developing reliability
4 programs. It just will upend many of the settled questions
5 that have been in the background.

6 So I think the question is fundamentally, how do
7 we organize our electric system to achieve our goals? And
8 who's going to be at the center of financing that? So
9 before we proceed to think about what's coming next, I'm
10 just going to review in more detail how we got here.

11 Here's a brief history of the California market.
12 It does not call out, for example, key programs like the
13 Self Generator Incentive Program. It's just a way that
14 people can see how incrementally we have started to move in
15 this direction, but without a central strategy.

16 So again, last time we tried this leading up to
17 the new millennium, we deregulated the electric industry
18 and we created a flawed retail market and retail design for
19 consumer choice. Now, essentially private electric
20 utilities only provided wire and transmission services.
21 And customers were expected over time to buy their
22 electricity from third-party companies.

23 After a catastrophic collapse of the new markets,
24 California very consciously made the decision to return to
25 the three IOUs and the multiple municipal utilities as the

1 dominant and monopoly providers within their geographic
2 areas of retail electric service for California consumers,
3 but began to restrict the ownership of generation for those
4 electric utilities. So we still had a market for portions
5 of this system.

6 So in addition, part of that response was to
7 develop new business models and tools to enable alternative
8 models of customer choice.

9 Three of today's major vehicles were initiated in
10 this period, in 2002. The Legislature passed AB 117, which
11 created the framework for community choice aggregation. In
12 2006, the Legislature also passed SB 1, creating the
13 California Solar Initiative. In 2012, AB 2514, which
14 created the energy storage mandates. So you can see how
15 these things happened, but not in a rigorously defined and
16 thought through program.

17 Slide two just sort of points out how innovation
18 is actually starting this process of hollowing out the
19 investor owned utilities and their role as central
20 procurement and providers.

21 So the confluence is these disruptive business
22 models represented -- I just did two examples of CCA and
23 net energy metering -- are to some extent dramatic. In the
24 case of CCAs it's local elected officials after years of
25 thinking about starting to embrace the challenge. And net

1 energy meeting, which is fueled by unprecedented cost
2 reductions in PV solar.

3 So we've seen a 30 times increase in California
4 customer engagement in new energy solutions to the point
5 that as of today, over 1.9 million Californians will be
6 acting on some type of energy choice by the end of 2017.

7 So looking forward to 2020 and beyond, it's
8 entirely conceivable again that the vast majority of
9 Californians receive their retail electric service by a
10 entity other than a utility.

11 So front and center in this energy transition is
12 the fact that technology, advanced metering infrastructure,
13 rooftop solar, increasingly price drops in battery storage,
14 just as examples are allowing customers themselves to
15 invest in systems that allow them to meet needs that were
16 once the sole providence of a regulated monopoly utility.

17 So this progression, and the implication that
18 Californians are going to be driving an increasing share of
19 the investments in the energy systems through consumer-
20 oriented purchases of electric cars, rooftop solar,
21 batteries in garages, if that continues we must be
22 increasingly focused on reorienting our energy system to
23 enable customer engagement.

24 But there's a whole range of other services and
25 compacts, whether it's advanced energy research, energy

1 efficiency grant, low-income support, protecting consumers,
2 resource planning, ensuring reliability, that are financed
3 by a charge based on the volume of electricity used. So as
4 customers depart, those costs may be passed on
5 differentially to different retail customers, depending on
6 the program. And there's the less of that centralized
7 planning that helps us to be sure that we're able to meet
8 our goals.

9 This is the challenge of a democratizing
10 electrical system is that as millions of people make
11 choices we also have a whole range of not just distributed
12 energy, but distributed decision making. How do we make
13 sure that it adds up to the state's policy goals?

14 So slide three just kind of shows a little bit
15 about how we think this trend could continue that just kind
16 of points to increasing shares. We didn't include direct
17 access since the Legislature has not lifted the cap. If
18 that were to take place, I would expect that direct access
19 for commercial and industrial customers, as it has in other
20 states, like Illinois, would also probably take bites out
21 of the IOU and potentially some of these other shares.

22 So after today's proceedings, the CPUC and the
23 Energy Commission -- and we'll work with the California
24 independent system operators -- we'll work closely to
25 develop a set of strategic options to consider how we

1 proceed. High on this list will be the role of the
2 utility, the CCA and rooftop solar and retail market. And
3 how regulatory models themselves must change to accommodate
4 this transition from a few very, very large utility
5 decision makers to millions of distributed market
6 participants.

7 So thank you and I look forward to hearing your
8 panelists and speakers. I will say that people are
9 starting to hand me papers that they would like to have
10 entered into the record. So I encourage you to give them
11 to Nick Chaset, so that we can serve them on all the lists
12 and they can become publicly noticed.

13 I also will say that I'm sorry that we're not
14 going to have Peter Fox-Penner. He had an emergency that
15 came up, so he couldn't join us today. He has a statement,
16 which we'll also produce as part of the record, but I would
17 recommend his book to you "Smart Powers," an analysis of
18 how you can look at these different trends.

19 So with that, I'll shut up and pass it along to
20 my colleague Bob Weisenmiller.

21 CHAIRMAN WEISENMILLER: Thank you. Thank you,
22 Michael, for the opportunity to be here today. And at the
23 same time for actually starting to deal with some
24 fundamental questions.

25 Often times in our agencies we have a myriad of

1 applications that are dealing with pieces of the puzzle.
2 And this is a welcome opportunity to take a more
3 comprehensive view. Obviously, we're at this nexus of
4 regulations, market and technology. And as you said,
5 certainly the technology is changing fast. I want to
6 remind everyone that most of our industries are not
7 considered utilities and are not regulated by the PUC. And
8 so going forward, again you're back to the question of
9 which of the functions are still utility functions and
10 which are not and what are the consequences of that
11 mixture?

12 Again, I want to remind everyone of a couple of
13 basic points. One is that certainly markets can change on
14 a dime. Technology can also really go through traumatic
15 transformations. Regulatory processes take forever. You
16 know, I've heard people describe it as watching paint dry
17 and many of you have been in those processes. So one of
18 our challenges, particularly I think this notion of getting
19 out in front with the plan, is if we don't when we hit
20 these regulatory singularities we're going to be scrambling
21 really, to try to catch up with the consequences.

22 Another sort of fundamental thing, again is that
23 most industries are not considered utilities and are not
24 regulated by the PUC. And certainly more and more of those
25 industries are getting into some of the services. Again,

1 people really don't care about electricity or gas or
2 whatever as much as the basic energy services. Certainly,
3 I think Ralph and I went through this discussion many
4 decades ago where people aren't really here to consume
5 electricity, but they want light, they want heat, they want
6 food. And certainly that's a way of producing that.

7 And so again when you look at the Alfred Kahn
8 definition of a utility in the "Economics of Regulation,"
9 it's where do you have economies of scale? I mean, if the
10 fundamental premise would be that you don't want to have a
11 number of competing distribution lines in downtown San
12 Francisco say that -- or at stage I would argue, before the
13 late '70s the theory was well, it's cheaper to build a
14 larger power plant than a smaller power plant. You can
15 reduce rates, you can grow a rate base, shareholders and
16 consumers are very happy.

17 At this point, there's clearly not economies of
18 scale in generation. At that point, in the late '70s it
19 was pretty clear that building larger nuclear plants was
20 not an economic solution, particularly relevant to energy
21 efficiency, renewables, cogeneration. So at this point
22 again, when you look at the procurement function, people
23 have lots of choices. I mean that's the basic message that
24 we're talking about the technology. You can have a solar
25 system installed on your roof. You could have combination

1 of energy efficiency. You can get zero net energy.

2 Probably the choices are greater for commercial
3 industrial customers than they are for residential, but
4 certainly people are looking at aggregating the residential
5 choices. So again, a regulatory compact would, which has
6 provided reliability, has provided service to all, has
7 provided some degree of consumer protection, what do we do
8 going forward?

9 Thinking about, for example, reliability I was in
10 this room not that long ago when FERC and PUC were debating
11 this question of capacity markets. And the PUC solution
12 was, "We'll just do bilateral contracts to keep the central
13 facilities operating."

14 What I understand at this point, given the
15 changing nature of industry, utilities are not signing
16 bilateral contracts. So we're in this sort of
17 transformation, at this point. We know we had a system
18 which sort of worked before. We're going into the future,
19 which if we think about and are clever can work, but we've
20 got to get out in front of it. This other part of it, just
21 like I said, it's really critical that all Californians
22 have access to essential energy services at a reasonable
23 cost.

24 Well, the reality is competitive markets. You're
25 going to see your products to folks that can pay your bills

1 and that can pay their bills. And unfortunately, some of
2 our citizens can't, or need some degree of care or other
3 opportunities, ways of making sure they continue to get
4 those essential services. I mean, markets do not care
5 about everyone is the bottom line, so how do we make sure
6 as we go through this transformation we're not leaving
7 folks behind?

8 Other sorts of questions is obviously this is
9 great for innovation and we need to keep pushing the
10 innovation. We also need to be continuing to be pushing
11 for jobs. Certainly, the utility sector, utility workers
12 have phenomenal legacy benefits in many respects compared
13 to the clean tech industry. But how do we again make sure,
14 going forward we're not only benefiting everyone, but we're
15 making sure that we maintain that good jobs opportunities
16 for our citizens?

17 So I think basically we're going through a real
18 transformation. It's important to think fairly deeply
19 about the issues that are coming up, try to get out in
20 front of them. I would say one of the really critical
21 things obviously, as Michael talked about, we have very
22 aggressive greenhouse gas goals. We need to transform our
23 whole societies in that way. Utilities are part of the
24 engine for doing that. And their ability to do that, to
25 provide the financial commitments, are not obvious going

1 forward. So somebody's got to help us do that
2 transformation. And there are ways that innovation can
3 drive it faster. And there are other ways where we may
4 find the pieces we need not really in place.

5 So bottom line is it's a good opportunity today
6 to start the conversation, think deeply about some of these
7 issues. And realize we need a plan going forward, so that
8 we get out in front of stuff before markets or technology
9 really opens up opportunities we haven't thought about, or
10 challenges we've not thought about and try to address with
11 what's going to be a slow, deliberate, careful regulatory
12 approach.

13 So thanks.

14 PRESIDENT PICKER: So every one of the
15 Commissioners who sits here before you has had a hand in
16 pieces of this. And so this is probably our first chance
17 to really sit as two bodies, and even within bodies, to
18 think about what it means that these individual efforts are
19 leading to a transformation. So I'd like to just check to
20 see if any of my colleagues have anything they'd like to
21 say.

22 I know Commissioner Peterman has been looking a
23 lot at these kinds of issues from the keen eye of an
24 economist as to how costs are distributed.

25 COMMISSIONER PETERMAN: Thank you, President

1 Picker, Chair Weisenmiller for convening this forum. We
2 have a lot to go over today, so I'll be brief. Let me just
3 echo my thank you for all of you participating.

4 We began to touch upon these issues with our en
5 banc in February on continued choice aggregation. And
6 there is still follow-up work we're doing in response to
7 that. But I think that discussion and really seeing the
8 broad interests in what was happening, not only with
9 community choice aggregation, but implications for the
10 utility, got us thinking more broadly about declining load.
11 And so I do think it's necessary to start having this
12 conversation and for us to be able to identify what are the
13 different steps as agencies we need to take.

14 In particular, I'm interested in understanding
15 and getting feedback on the order in which things need to
16 happen. Because everything unfortunately cannot happen at
17 once, but it's time to start the process.

18 COMMISSIONER MCALLISTER: I would echo that
19 thanks for all of you for being here and for Chair
20 Weisenmiller and President Picker for convening this. I'm
21 really looking forward to the conversation, I will be very
22 brief here. I guess I would just put a couple of words out
23 there.

24 One is we're looking for ways to integrate. And
25 the regulatory process is not easy to do that within.

1 Certainly, I oversee the energy efficiency efforts at the
2 California Energy Commission. And I would just encourage
3 us to, in that area and other areas, to think about how we
4 can look at solutions as not bolt-ons. You know, often we
5 have carve-outs and bolt-on solutions and sort of it gets
6 pretty kludgy and pieced together.

7 And so if we can integrate and think about how
8 we can take all these various sources of energy supply on
9 the demand side, and on the supply side. And just figure
10 out how we can integrate them into a market that works
11 together and sends the right signals to each of them,
12 instead of having to bolt on different solutions and have
13 individual rules for each section of the solution.

14 So I'll try to think about those kinds of
15 solutions and help us work through these issues, so I
16 really appreciate all of you being here.

17 PRESIDENT PICKER: I will say when we were
18 putting the slides together for my presentation I thought
19 about including a slice in the slides for 2020 for zero net
20 energy buildings, which is your proceeding. But at this
21 point, we can't even guess what that's going to do to
22 declining load in the electric industry.

23 COMMISSIONER MCALLISTER: That's a great example
24 of an issue that looked like a nice silver bullet ten years
25 ago. We didn't have all the market-based solutions that we

1 have now and the meter meant more then, than it does now.
2 And it's increasingly kind of an arbitrary distinction at
3 that meter. We have stuff out there on the Grid. We have
4 stuff behind-the-meter. And we really need to figure out
5 ways for all of that to work together.

6 So zero net energy really doesn't look much like
7 it did ten years ago and we have other solutions and we're
8 fortunate to have those solutions. I mean, I think we have
9 a lot of opportunities to do things in an economically
10 optimal way that will still get us where we want to go.
11 And that doesn't necessarily mean having all the resources
12 for an individual property behind-the-meter.

13 For example, I mean we could talk about many
14 issues in that same light. We've learned a lot. We have a
15 lot more technology, and innovation and smarts in the state
16 as compared to ten years ago. So I think it's really an
17 opportune moment to revisit that issue along with all these
18 others.

19 COMMISSIONER RANDOLPH: I'll just briefly thank
20 President Picker and Chairman Weisenmiller for convening
21 this. As we look at issues of looking at the big picture
22 in integration, consumers, as they're making these choices,
23 it's not their responsibility to look at the big picture.
24 It's our responsibility. They don't see the full cost
25 picture. They don't see the full reliability picture. And

1 so having discussions like this, where we can identify
2 those challenges and potential solutions is absolutely our
3 responsibility. And I'm excited to have the discussion
4 today. Thank you.

5 PRESIDENT PICKER: Commissioner?

6 COMMISSIONER GUZMAN ACEVES: No.

7 PRESIDENT PICKER: Nothing, oh okay. Okay.

8 Well, thank you.

9 So with that, I'm going to turn this over to
10 Nick. Are you going to introduce the Panel Chair?

11 MR. CHASET: Yes, thank you.

12 So our first panel is our consumer-oriented
13 panel. We have a group of esteemed representatives of
14 various consumer groups. And the panel will be moderated
15 by Ralph Cavanagh, so I'm going to pass it to you, Ralph,
16 to introduce the speakers and kick it off.

17 PRESIDENT PICKER: So Mr. Hawiger, could you turn
18 your name-tag around, so that we can see it? Thanks.

19 MR. CAVANAGH: And actually if all of my
20 colleagues could do the same.

21 Thank you, Nick. I'm Ralph Cavanagh. President
22 Picker, Chair Weisenmiller, it's my privilege to present to
23 you six admirably qualified representatives to address the
24 question, "What customers want", which is how we're
25 starting. And although the diversity of California and its

1 desires and wants can't possibly be captured in six people,
2 Nick Chaset and his colleagues have done as good a job as
3 is possible, as I think you'll see in a moment.

4 The way I'd like to suggest we proceed, and of
5 course I have no power whatever to enforce this suggestion,
6 is that the Commissioners allow the opening statements to
7 go in order and we'll proceed from left to right. After
8 which I will look to all of you and I will be astonished if
9 you do not consume the remaining time. But in the unlikely
10 event that you don't, I will have a few questions for the
11 panelists as well.

12 We will begin with Marcel Hawiger, who is an
13 attorney for The Utility Reform Network. And each panelist
14 is going to get the same minimalist introduction, because
15 their remarks will speak eloquently for themselves.

16 Marcel? I'm right here. I'll come up and shut
17 you down, Marcel.

18 MR. HAWIGER: Thank you very much.

19 Commissioners, thank you very much for inviting
20 TURN to participate in this important en banc. My name is
21 Marcel Hawiger. I'm a staff attorney with The Utility
22 Reform Network. TURN, for those who might not know, is a
23 statewide consumer advocacy organization. We represent the
24 interests of residential utility customers at the Public
25 Utilities Commission and at the Legislature and wherever

1 else we have the resources to participate. I'm going to
2 skip some of the introductory, because we don't have much
3 time in this seven minutes.

4 (off mic colloquy.)

5 And let's see, am I supposed to point this in
6 some particular -- okay. I hope to get through a few
7 topics, but we'll see how many I actually cover. Let me
8 say the Staff White Paper does an excellent job summarizing
9 where we are in terms of energy procurement. Since about
10 2000, obviously for about the first decade it was mostly
11 the investor owned utilities, the municipal utilities and
12 the legacy direct access or retail choice in California.

13 As President Picker mentioned, since 2010, what
14 we've seen is a huge growth in community choice aggregation
15 and rooftop solar.

16 And I think the central issue facing California
17 is how do we get to a 50 percent and more renewable and
18 clean energy future while maintaining reliable service and
19 hopefully at the lowest possible prices. I fully agree
20 with President Picker, your comment that technology and
21 reduced solar costs have driven the rooftop solar
22 explosion.

23 I want to make two points, main points, in my
24 remarks. One is I think under this existing system, we can
25 meet our goals although there are some significant

1 regulatory issues that we have to solve. And my colleague,
2 Matt Friedman, discussed some of those issues with respect
3 to community choice aggregation at the prior en banc. What
4 I hear now though is a renewed interest in a discussion
5 about reopening this sector, the direct access electric
6 service providers. And I want to posit that the structure
7 of direct access is fundamentally different from community
8 choice aggregation. And that the best way not to meet our
9 goals is to reopen direct access before solving some of the
10 existing problems.

11 Direct access, unlike CCAs and rooftop solar is
12 not driven by technology. I want to suggest that it's
13 driven by the traditional problem of lumpy generation
14 investments. You've all probably seen this graph. You
15 know, you build a power plant. You get excess capacity for
16 some time until load catches up and then you build another
17 power plant. The promise of distributed resources, solar,
18 storage, etcetera is that we can build it smaller.
19 Consumers can put it in smaller. They can put it in
20 faster, hopefully it can better match actual load growth.
21 And hopefully we can avoid building large power plants that
22 become stranded if load growth doesn't material as
23 forecast.

24 This is what actually happened in California.
25 It's not just theory. The 1980s, each line here is 500

1 megawatts, '84,'85,'86,'87,'88,'89, over 1,000 megawatts of
2 new power plants came online each year including about
3 3,500 megawatts in 1985 when Diablo Canyon came online.
4 You note that there is kind of a flat line in the '90's and
5 we could maybe talk about that later. A number of factors,
6 at least one of which was opening the discussion, opening
7 the discussion about retail competition by the Public
8 Utility Commission at that time. And concerns about who's
9 going to be the one responsible for buying load, but there
10 were other factors.

11 Anyway, all the capacity got built in the '80s.
12 The result was that there was a lot of cheap wholesale
13 power in the spot market. We were in that point where
14 there's excess power plants capacity. People were happy to
15 sell power cheap, but utility rates were high. They
16 reflected the imbedded costs of building those power
17 plants. So large industrial and commercial customers
18 wanted access to that cheap power. They went to the
19 Legislature and lo and behold, we got direct access.

20 Where are we today? We're in somewhat of a
21 similar situation today. The early 2000s -- and note now
22 each line is 1,000 megawatts, not 500 -- a number of power
23 plants built. Some were built in the early days of the
24 market by companies such as Calpine that built merchant
25 plants on the hope of high energy costs. Some were built

1 in the mid 2000s as a result of the resource adequacy rules
2 and utilities signing long-term contracts. But most
3 importantly here we got 2009, 2012, 2013, 2014, large
4 editions of power plants, you know, it was 3,000 megawatts
5 in 2012, almost 7,000 megawatts in 2013. These are mostly
6 new wind and solar utility scale renewable plants built
7 under long-term contracts to the utilities.

8 Now, they don't have the same impact as the
9 combined gas cycle, a lot of capacity, less energy. Still,
10 we all know we are in an era where we have cheap wholesale
11 power negative pricing. No wonder other industrial and
12 commercial large customers would like to get it. Why not,
13 it's out there. Who wants to keep paying for the capacity
14 costs that are imbedded in utility rates?

15 What about residential customers, what happened
16 the first time around? Well, you see in this graph
17 industrial customers, 30 to 35 percent of the load went to
18 direct access. Large commercial customers, about 15
19 percent went to direct access. The small commercial and
20 the residential especially less than 3 percent ever went on
21 to direct access.

22 And there's also this interesting time period
23 between December 2000 and July 2001, when wholesale markets
24 went haywire and all the electric service providers dumped
25 their customers back down to the utilities.

1 I'm going to skip this for a moment. So what's
2 my message? My message is that residential customers --
3 direct access did not benefit residential customers. They
4 signed up for clean power, mostly based on elusory promises
5 of 100 percent green power that was basically met with
6 renewable energy credits, no new renewable generation
7 built.

8 The direct access model is built on cherry
9 picking large commercial, industrial customers who want
10 cheap prices who have fairly good load factors. It's based
11 on short-term contracts with customers. I don't know all
12 the contracts. I don't think anybody signs up for more
13 than two years, certainly not more than five years, with
14 their electric service provider. They do not sign long-
15 term supply contracts that result in new renewable
16 generation capacity being built. And that's different from
17 the CCA hope. And we can come back to that.

18 The acquisition costs for residential customers
19 simply don't make it worthwhile for anyone to go after them
20 unless you forcibly through them all out into the retail
21 competition market. And the evidence in states with retail
22 competition shows that generally prices for residential
23 customers are higher than the default utility rate. And
24 I'm not talking about interstate comparisons, because those
25 are very difficult to do. I'm talking within a state that

1 has both retail competition and a default service provider.

2 In fact, I gather that although the New York
3 State Public Service Commission just recently started a
4 rulemaking to consider ending residential retail
5 competition, due to a lack of benefits. So --

6 PRESIDENT PICKER: And also predatory marketing.

7 MR. HAWIGER: Absolutely, which we have certainly
8 seen in some of -- I don't know if it's predatory -- we've
9 heard complaints on the gas side about marketing tactics.

10 I think at the moment where we're at we can deal
11 with some of our issues, because community choice
12 aggregation is built on a model of a stable customer base
13 that may allow for contracting long-term with renewables.
14 There certainly are credit issues and we're hoping that
15 those will be resolved. There are still issues to be
16 worked out. What happens if prices do go crazy in the
17 wholesale markets? There are also accountability for the
18 CCAs. Both of those are not present in the electric
19 service retail competition model.

20 The Staff White Paper lays out very nicely the
21 problems and issues we have to solve to get to a greater
22 than 50 percent renewable future. Do we continue to rely
23 on the utilities to procure long-term capacity and then
24 allocate other costs among other entities? That's sort of
25 the current model. Do we require all entities to meet

1 clean energy and reliability goals, which would require
2 some changes in jurisdiction or do we create a wholly
3 separate procurement entity? Sorry, you know, my --

4 PRESIDENT PICKER: We don't have anybody here
5 from DWR to answer your call.

6 MR. CAVANAGH: Wrap up, Marcel.

7 MR. HAWIGER: I'll just leave you with the
8 message that I think there's going to be a challenge
9 already with the existing market, but I think we can solve
10 them. And I would encourage you not to consider and go
11 forward with reopening retail competition until we figure
12 out some of the existing challenges we have in our
13 procurement model.

14 Now I'm also happy to talk more about what I see
15 residential customers benefitting. How they've benefitted
16 ,the rooftop solar explosion, what has driven that, what
17 challenges remain. But I think -- was that a one minute or
18 was that a time out? (Laughter.)

19 MR. CAVANAGH: It was one minute, but you've used
20 it.

21 MR. HAWIGER: Okay, so hopefully we can come back
22 through some of that. I thank you very much for your time
23 and I hope we can continue this conversation.

24 MR. CAVANAGH: Thank you, Marcel.

25 We'll be hearing next from Strela Cervas who is

1 the Co-Executive Director of the California Environmental
2 Justice Alliance. Strela?

3 MS. CERVAS: Thank you so much, it's working now.
4 (microphone).

5 Hello everybody, thank you so much Commissioners,
6 for having me here today. I really appreciate you inviting
7 the environmental justice perspective to come here. I'm
8 probably going to have probably the most different
9 perspective, coming from an environmental justice
10 community. And I'm going to speak pretty broadly. I was
11 asked to talk about the vision for CEJA, the California
12 Justice Alliance, and what our top priorities are and what
13 are the solutions we've been working on. So I'll just lay
14 that out.

15 So first of all, who is the California
16 Environmental Justice Alliance for the people in the room
17 that don't know us. So we represent 30,000 working class
18 people of color all across California. And we're really
19 founded on the idea that people had had enough of their
20 communities being the dumping ground for pollution and
21 toxic facilities and unsafe drinking water. And that we
22 have a vision for our people that deserve a healthy place
23 to live, play, and go to school no matter what your race
24 is. And that all people should have an opportunity to
25 participate in policies that impact them on a day-to-day

1 basis. And that the most vulnerable communities and the
2 most impacted communities should be the leading voices with
3 what their own vision for a healthy and sustainable
4 community should look like.

5 So I'm going to lead with what our energy equity
6 work is. Last month, the NAACP came out with a report that
7 said that electricity is a human right. Electricity is a
8 human right. And we actually, at CEJA, really do believe
9 that. They talked about a man having to resort to using an
10 electric generator to power his home after losing service
11 from the Grid. And then got carbon monoxide poisoning from
12 a generator that ended up killing himself and his family.
13 And then a mother in New York, who used a candle light to
14 power up her home and the authorities said that the candle
15 was responsible for killing her three children and herself.

16 Here, in California, we see very similar issues
17 of drastic examples of this magnitude. And a new report
18 from PSE Healthy Energy came out that said that over 80
19 percent of peaker plants in California are located in
20 disadvantaged communities. And we see that these peaker
21 plants are some of the most highest polluting communities.
22 And they're located in the most vulnerable communities.

23 So given all of that, what we're really excited
24 to see in California is a transition off of fossil fuel and
25 leading into this new fossil-free era, where we're bringing

1 in a lot more renewable energy and efficiency systems into
2 especially disadvantaged communities.

3 What we talk about in CEJA is something called
4 the green divide. And what we often fight for are energy
5 systems that are specifically prioritizing environmental
6 justice communities that have been often left out of the
7 green economy. Recent reports show that only six percent
8 of all rooftop solar has actually reached disadvantaged
9 communities. And so this is really the green divide that
10 we're talking about that disadvantaged communities are
11 often told that the green economy will save them, will give
12 them jobs, will bring in a lot of infrastructure. But
13 right now, what we're seeing is still a huge gap in the
14 clean economy.

15 There aren't a lot of local jobs and a lot of
16 local economic opportunities for these communities and we
17 see that this can really be addressed.

18 One thing that we did in partnership with the
19 California Energy Commission this past year was support the
20 release of the SB 350 Barriers Report. And I don't have to
21 go through everything in that report, because all of you
22 Commissioners wrote it. But for the people in the room,
23 I'll just highlight a couple of different barriers in that
24 report that don't only apply to SB 350, but I think should
25 be highlighted for the purposes of this en banc.

1 One is that environmental justice communities
2 experience low home ownership rates. So we have a lot of
3 number of renters in our communities that often don't get
4 the benefits of the green economy. There is insufficient
5 access to capital. There is building age and a problem
6 with old building stock. And then there's a lot of remote
7 and underserved communities all across California.

8 There are different program and policy barriers,
9 so one is market delivery. And to this what we mean is how
10 do you actually effectively reach low-income communities
11 and disadvantaged communities? And that you really need to
12 partner with community-based organizations on the ground
13 that really know how to do that.

14 There's a lot of data limitations. So for
15 example, the narrative is that rooftop solar cannot
16 penetrate low-income communities or disadvantaged
17 communities, because our rooftops are really unsuitable.
18 We live in really old buildings again, but there isn't a
19 whole lot of data that shows this, and many other examples
20 of data limitations.

21 And then there's the unrecognized non-energy
22 benefits. So what often communities want is to feel that
23 the state and our policies are actually investing in
24 environmental justice communities, and that it's not
25 something just for the rich and the wealthy.

1 So the top priorities and the solutions that we
2 seek to address some of these things are -- we do a lot of
3 advocacy to transition away from fossil fuels. And the
4 conversation, I think today, has been would you prefer IOU
5 versus CCA versus direct access? Again, what we're really
6 excited is transitioning authentically away from fossil
7 fuels and dirty power plants and oil refineries that are
8 located in disadvantaged communities and bringing in a lot
9 more local distributed generation into these communities.

10 Closing that green divide, so again how can we
11 increase that 6 percent or even less of the renewable
12 energy in these communities? And turn that into 25 percent
13 or even 50 percent of the program, renewable energy
14 programs, into disadvantaged communities. And various
15 examples to do that are how to get specific carve-outs in
16 different policies. There are also not just a carve-out
17 but actual concrete big programs that can scale up.

18 And then how do we actually get the public health
19 benefits and then the local jobs and economic benefits into
20 these communities.

21 Community participation is also a big deal for
22 us. So this is something that I would like to highlight,
23 because energy policy is something that is incredibly
24 wonky. We're sitting in a room in Sacramento and it's
25 very, very costly resource intensive, capacity intensive to

1 bring up the thousands and thousands of community members
2 that are impacted by policies that are passed by our
3 Legislature and our state to come and speak for themselves
4 and talk about what they really want in their communities.
5 So I would encourage that we think about how to
6 authentically engage in communities and for there to be a
7 real community voice, so that that is meaningful.

8 And then a comprehensive suite of programs, so
9 what we think at CEJA is that there is not really a one
10 size fits all. Again there are a variety of different
11 barriers that are listed in the SB 350 Barriers Report and
12 many others that I can outline. And we have advocated on a
13 comprehensive suite of programs that can address the many
14 different barriers.

15 So we've advocated for a good NEM and VNEM
16 program with a specific focus for disadvantaged
17 communities. We've advocated for shared solar programs,
18 again with a specific focus on disadvantaged communities.
19 We've advocated for a feed and tariff model as well. And
20 we've also advocated for CCA models supporting the local
21 members that are part of CEJA. So we have a number of
22 local member organizations that are part of the California
23 Environmental Justice Alliance that are advocating for CCAs
24 on the ground. So from San Francisco to Richmond, to San
25 Diego, now in L.A., and then we also have a partner in the

1 Central Coast that have been in conversations around a CCA.

2 So I would say that again there is no -- for us I
3 don't think there is a one size fits all, because there are
4 a number of different variables there.

5 And then lastly is collaborative partnerships.
6 And so this is something that we've been working on with
7 both the California Energy Commission and the CPUC. And
8 what we mean by this is that we really want to engage in
9 collaborative partnerships with all of you of. And not
10 just come up here and have two minutes to speak, but really
11 invite you to come to our local member organizations on the
12 ground, so that they themselves can tell their stories.
13 And they themselves can talk about what the barriers are
14 and challenges are and then what their vision is for an
15 equitable energy future.

16 We did this when we partnered with the CEC on the
17 SB 350 Barriers Report. We're now doing it with an energy
18 equity tour. Some of you have engaged in that where we're
19 bringing some of the CPUC Commissioners to local members on
20 the ground and they get to tour the local area. And look
21 at what the dirty fossil fuel facilities are and then also
22 what are some of the really exciting models for renewable
23 energy locally.

24 So with that, thank you very much. And I'll
25 bring it to the next speaker.

1 MR. CAVANAGH: Thank you.

2 The next speaker is Tim McRae, Vice President of
3 the Silicon Valley Leadership Group. Tim?

4 MR. MCRAE: Good morning, Commissioners. I am
5 going to speak first about the Silicon Valley Leadership
6 Group, because we're sitting here on a customer panel. And
7 we do represent a lot of large end users of energy, who are
8 energy customers, but we represent more than just that. We
9 represent rooftop end utility scale solar companies, energy
10 service providers, energy efficiency, demand response and
11 solar storage companies and an investor owned utility. And
12 that membership informs our comments and where we come from
13 on these issues.

14 I will say that we try to engage with both the
15 California Public Utilities Commissions and the California
16 Energy Commission. And when we do, we often try to poll
17 all our members and see what it is that we have to say
18 about a particular proceeding. And then we usually weigh
19 in once. And we don't have the nimbleness or the
20 flexibility to be able to say, "Oh, TURN said this and
21 reply to comments over here. We agree with what PG&E said
22 in these sets of comments."

23 And when I first joined the Silicon Valley
24 Leadership Group about four years ago I said, "Is it worth
25 it for us to weigh in, in this way? And I talked to a

1 number of people including staff at the CPUC. And one
2 staffer at the CPUC said, "Actually, we really appreciate
3 when you weigh in, because you have to stitch together a
4 number of different perspectives. You have to weigh out
5 all these different heterogeneous groups." And that is
6 something that we have to do when we make these decisions,
7 so I hope that you consider our remarks in that light.

8 That said, there are no easy answers in energy.
9 I'll share our perspective on direct access and community
10 choice aggregation and rooftop solar. But I will say that
11 every problem and every solution in energy is heterogeneous
12 and complex and nuanced. And no one understands that
13 better than the seven of you sitting on this stage, so I
14 really commend you for your service on these Commissions.

15 Direct access, we supported Senator Hertzberg's
16 bill last year, which would have raised the direct access
17 cap and filled it with renewable energy only for a
18 certainly amount of, I believe it was 4,000 megawatts. We
19 did this in part, because we have direct access customers
20 and folks who want to be direct access customers. We have
21 energy service providers who have been happy to fill that
22 load. But interestingly, we also have customers who are
23 procuring their own 100 percent renewable energy. And they
24 wanted to be able to have a level playing field as they
25 made their commitments to bring in more renewable energy

1 and want everybody else to have to play by the same rules.

2 On community choice aggregation, we have not
3 taken a public position either for or against community
4 choice aggregation. So the comments that are offered here
5 are my own. I think that the best way that I can describe
6 what I think about community choice aggregation is that the
7 upside is that it's a blank sheet of paper. And the down
8 side is that it's a blank sheet of paper. What are you
9 going to do when you start with a sort of complete zero and
10 say, "We want to procure energy on behalf of large amounts
11 of customers"?

12 I understand the appeal. It's greener. It's
13 cheaper. It provides choice. Why not? But I still think
14 that there are downsides. One downside I'll offer is what
15 I call "institutional knowledge.". I worked for a couple
16 of years earlier in my career for the Pacific Gas and
17 Electric Company. And when you work for PG&E, the first
18 person that you meet is Joe who's been working on energy
19 efficiency projects for the last 30 years. And you say,
20 "Joe, we're thinking of doing this particular type of
21 project." And Joe will say, "Oh, that's interesting. We
22 tried that about, I don't know, 20 years ago. And we did
23 it for five years and it kind of worked. And then the CPUC
24 didn't like this part about it. Or we weren't able to work
25 this part about it out. And so we just discontinued it, 15

1 years ago."

2 And when you start at a community choice energy
3 company, you don't have 22,000 Joes. PG&E has
4 institutional knowledge across a wide range of issues. And
5 I think that that's something that you lose when you start
6 with that blank sheet of paper.

7 There are upsides. I think that IOUs have to
8 serve the shareholders. And being able to pile money into
9 more services for your customers and not have to worry
10 about serving your shareholders is a benefit. And of
11 course they can buy greener, cheaper power right now.

12 But the one issue I will flag, and this is
13 something I know that you'll be thinking about, is that the
14 compensation of investor owned utilities for investments
15 they made previously in renewable energy contracts is a
16 question of fairness. They were required to enter into
17 these contracts and it's not their fault that renewable
18 energy got cheaper and we don't think that they should be
19 left holding the bag.

20 Rooftop solar, so the Silicon Valley Leadership
21 Group has been solidly in support of promoting rooftop
22 solar for years. I've been here for four years. We've
23 been solidly supportive of them in that time on net energy
24 metering, on residential rate reform discussions, saying it
25 should be a portfolio content category one resource in the

1 calculation of renewable energy credits, helping permitting
2 streamlining efforts. And quite frankly, it's a low-cost
3 way to reduce greenhouse gas energy throughout California,
4 that individual Californians, both families and businesses
5 can choose as a tangible, personal way to combat the
6 climate crises. And that should not be left out.

7 That said, I don't think that rooftop solar is
8 the exact same as direct access or retail choice and I'll
9 get into why. First, promotion of rooftop solar and
10 distributed energy resources mitigates the risk that power
11 will be in the hands of a small number of market actors, as
12 it was in the energy crisis in the early 2000's. And so
13 you want to have distributed energy out there to be able to
14 mitigate that risk.

15 Second, rooftop solar eliminates the need for
16 significant investment in transmission wires. If you've
17 got a lot of folks out there who are generating their own
18 energy on their own roof then you don't have to worry as
19 much about the transmission investments that we will need.
20 Not to say that we don't need transmission investments.

21 And third, when it is used, solar and storage, an
22 increasing number of people who are putting rooftop solar
23 and then using storage as well, that can be used to balance
24 the Grid. And it can direct clean energy, clean solar
25 electricity where and when it is needed most lowering costs

1 for utilities and ratepayers. And I will stop there and
2 look forward to your questions later.

3 MR. CAVANAGH: Thank you, Tim. Mark Byron is
4 here, presenting the views of the Office of the President
5 of the University of California. Mark?

6 MR. BYRON: Hi there, my name's Mark Byron. I'm
7 the Executive Director of Renewable Energy Programs at the
8 Office of the President of the University of California and
9 thank you for inviting me today. Before I get to my
10 comments, I'd like to give a little background on the
11 University of California. Everybody knows UC. Hopefully,
12 there's a few UC graduates here at the dais and in the
13 room. But I'll give a perspective UC from an energy view.

14 So UC is 10 campuses, five medical centers, three
15 national laboratories. We're a California institution,
16 obviously. We're committed to the carbon neutrality goal
17 of the state. UC set forth in 2013 that by 2025, we will
18 be carbon neutral in our operations and that is a big lift.
19 It's a big lift, because we are two million megawatt hours
20 energy consumption. We have 800,000 megawatt hours of self
21 generation. We consume a lot of gas, 14 million MMBTUs a
22 year.

23 We have 1.2 million megawatt hours of energy that
24 we purchase off the Grid. We have many supplies. We have
25 bundled utilities, municipals, WAPA and direct access. So

1 we see every part of the state in our procurement
2 operation.

3 We have campuses that have been direct access
4 since the beginning. We are now our own direct access
5 supplier. So my day job is running an ESP. And we are
6 registered at the CPUC as an ESP. We've had Enron, Arizona
7 Public Service Renewable, but we are now our own. We've
8 been into two agreements for long term supply. 200,000
9 megawatt hours of brand-new solar facilities in Fresno
10 County. We are the scheduling coordinator for those two
11 assets.

12 So we are a supplier and we are a customer in the
13 California market. So we experience all the wholesale and
14 retail parts of electricity business, as an institution.

15 And just as a side bar, I heard Strela say policy
16 is wonky. And Timmy said there's no perfect solutions, so
17 I'd just like to add that energy markets are brutal.
18 (Laughter.) Keep that in mind as you make your policy.

19 So the question posed to the panel was, "What do
20 we want?" And from our perspective what do we want? So
21 at the University of California, we want to achieve our
22 carbon neutrality goals and prove it can be done. We want
23 to be a good state actor. We want access to each campus,
24 so we can be our own supplier and create our own portfolio.
25 We want the ability to reach our emission goals and a

1 portfolio suitable for UC and its many stakeholders. We
2 have competing goals of carbon neutrality, program costs,
3 state mandates. And we'd like the flexibility to achieve
4 carbon neutrality and goals in a manner that can weave
5 those competing interests. We are carbon neutral focus,
6 but we like headroom above the RPS to create our own supply
7 and our own portfolio.

8 It concerns us to see layoffs at SunPower, their
9 stock price down, Calpine looking for a buyer. We'd like a
10 robust market of suppliers to create supply options and
11 solutions for us and to bring ideas to us, in addition to
12 our own ideas. We're concerns about cost transfer from
13 IOUs to other connected ratepayers, such as UC
14 stakeholders.

15 So our vision, you know, where our mission is
16 education, research and public service, so our vision is to
17 show a way and show it can be done as a large institution.
18 So we want a reliable grid. We want open access. We want
19 cost control. We want many green supply options and
20 related suppliers. And we want to be carbon neutral by
21 2025.

22 So the other part of the question that I read
23 were the steps. And I was thinking what steps, because
24 that's a big question. And maybe there's partial or full
25 direct access lifting, maybe it could be partial to related

1 entities, educational institutions. Maybe direct access
2 could be coupled with CCAs. So if you've left the utility
3 for a CCA, there's no reason why an ESP can't be part of
4 that area and then we can be a supplier. Or maybe it can
5 could be for CNI only, or industrial only and you can
6 protect the consumer, because there have been bad events
7 that happened to consumers with direct access.

8 Also, I'd like the utilities and everybody to
9 keep an eye on the reliability effects of the 50 percent
10 and beyond RPS standard. The ramping in California is
11 spectacular and ramping is when generation arrives and
12 departs. It's 10,000 megawatts I think was the ramp
13 yesterday approximately in maybe an hour or two.

14 I one time did a study of Latin American electric
15 grids. A large grid there is 800 to 1,000 megawatts and
16 we're ramping 10,000. SMUD is 3,000. The whole CAISO just
17 blows right past that, with all the generation showing up.
18 It's fantastic that we've been reliable so far. But as we
19 keep adding renewable generation, we've got to keep mindful
20 of that. I don't think outages serve anybody's policy
21 purposes.

22 And I would like to throw out as we go big, I
23 understand the rationale and the reasoning and why it
24 exists a bucket system in renewable energy procurement. I
25 truly get it: state jobs, local infrastructure, tangible

1 improvements to the California Grid. But as we go big and
2 as we think through these issues, I think we should
3 reconsider the bucket system and where generation is
4 located and what is best for California in total. I gave a
5 presentation yesterday to many campuses that receive direct
6 access service and the presentation in part was raising my
7 rates, or the rates they receive for direct access power,
8 because the duck curve has collapsed so much. And it makes
9 all the renewable energy, specifically the solar we
10 (indiscernible) twice as expensive as we modeled.

11 So it's weird that the lowering of market prices
12 raises retail rates, but that's what I mean when I'm
13 getting to energy markets are brutal. So with that, I
14 conclude my remarks and I'm glad to answer any questions
15 you have.

16 MR. CAVANAGH: Thank you, Mark.

17 We will hear next from a Nora Sheriff, who is
18 representing California Large Energy Consumers Association,
19 which all of us know as CLECA.

20 MS. SHERIFF: Thank you, Ralph. And thank you
21 Commissioners, good morning. I would like to express my
22 appreciation for having the customer panel go first. I
23 know that's not how the agenda was originally structured.
24 I think having the customer voice first when you're looking
25 at retail choice makes a lot of sense, because oftentimes

1 the customer voice can get lost. These are hard,
2 complicated questions and important issues. And I really
3 do appreciate being able to offer CLECA's voice and CLECA's
4 perspective.

5 Now for those of you who don't know CLECA is an
6 energy advocacy organization comprised of large industrial
7 customers, high load factor, high voltage for PG&E and
8 Southern California Edison service territories. Some
9 members take bundled service. Some members take direct
10 access service. Some have onsite generation. All members,
11 however, participate in demand response with some having
12 participated in demand response since the 1980s.

13 Now our vision, what do we want and what does
14 CLECA want in 2022, I think was the timeframe? Most of the
15 power plants facing once-through cooling retirement, once
16 through-cooling requirements, will have retired. It will
17 have been ten years since SONGS went offline. In about
18 another two-and-a-half years, Diablo Canyon will be
19 retiring. We'll be a lot closer to the 50 percent RPS,
20 perhaps on our way to a 100 percent RPS depending on the
21 Legislature and the goals that are set there. And 2030,
22 the target year for the climate change goals will be fast
23 approaching.

24 With that context, I expect in 2022 what CLECA
25 wants, our top three equally important priorities will be

1 about the same as they are now. And the first two are the
2 same as TURNs and that's having customers charged the
3 lowest reasonable cost for reliable electric service. And
4 having access to attractive and reasonable demand side
5 management tools. And for that, for CLECA that means
6 energy efficiency that takes into consideration the
7 individualized operations of industrial sites and demand
8 response and multiplicity of demand response options.

9 I'd like to drill down a bit into demand
10 response, because it gets a lot less attention usually than
11 energy efficiency and solar PV. And I want to clearly
12 communicate to you, the policy makers and also any members
13 of the Legislature that may be listening why demand
14 response matters and why you should care.

15 First, the demand response incentives help
16 industrial customers mitigate the impact of the high cost
17 of power here in the state on their cost of production.
18 And looking at the neighboring states' rates, looking at
19 global electricity rates in India and China, California
20 power costs are much, much higher.

21 And we want to keep industry, or we should want
22 to keep industry here in the state as opposed to leaving
23 the state to meet our ambitious climate goals to avoid
24 carbon emissions leakage. If you want to reduce emissions,
25 then don't just move them out of the state. If you

1 consider cement, steel, industrial gas, or beer, to name a
2 few key products that the CLECA members make you want those
3 produced in California, not somewhere else. They wouldn't
4 just not get made. And also maintaining manufacturing in
5 the State of California helps, Dr. Weisenmiller, with
6 keeping jobs in California. It's to just the utility
7 industry and the rooftop solar installers. Also
8 manufacturing are good jobs sources.

9 So if the big goal for the state is fewer
10 emissions, the energy policy has to consider the impact
11 that demand response can have on industrial customers. So
12 what does this mean in the context of retail choice? Well,
13 we think that there should be multiple demand response
14 options from multiple demand response providers. It should
15 include the investor owned utilities, CCAs, direct access
16 providers. Competition should be able to encourage
17 innovation and the multiplicity of options for the customer
18 to choose from.

19 And so looking at the structure of the retail
20 market, how do we ensure that these three priorities:
21 lowest cost, reliable service and robust energy efficiency
22 and DR options, are embedded? I think you have to have
23 real competition, reopened direct access. And remember
24 CLECA has both bundled members and direct access members.
25 There's got to be a way that we can figure out how to do

1 this without relieving the energy crisis, and do it fairly.

2 Competition can keep costs down. It can also go
3 hand-in-hand with reliable service if resource procurement
4 across the load serving entities is balanced to ensure
5 minimized costs, minimized reliability challenges and also
6 minimized carbon. And that reliability can turn on the
7 load serving entities model for procuring resources. You
8 can't just procure short-term resources. You can't just
9 procure solar or mostly solar. There needs to be a
10 balancing of the resource procurement. And this doesn't
11 mean don't do it. This may mean that the procurement
12 practices for the ESPs, the electric service providers, for
13 the community choice aggregators, may need to be regulated
14 a little bit more like the investor owned utilities
15 procurement practices are regulated. Obviously, this would
16 require a statutory change.

17 So the challenge will be ensuring that even
18 playing field among the load serving entities and their
19 procurement processes while ensuring reliability,
20 affordability and decarbonization. I think that the
21 progress is going to be lumpy and I think that the process
22 is going to be pretty bumpy, but that doesn't mean that we
23 can't do it. It does mean you're going to have to
24 prioritize and their reliability cannot be sacrificed.

25 As some of you may know, on Wednesday May 3rd at

1 7:00 p.m. the ISO declared a Stage 1 Emergency Event.
2 There was no flex alert. There was no warning. They went
3 straight to a Stage 1 and as I understand it, it was
4 because there were insufficient operating reserves. They
5 mis-forecasted load by about 2,000 megawatts. Some of the
6 imports didn't show up. Some of the generation they
7 dispatched didn't show up. And they had to respond and
8 they had to respond quickly.

9 This may happen more in the future as the
10 renewable output grows. And what did they do? The
11 operators called the three investor owned utilities and
12 said, "Give me your demand response. What demand response
13 do you have?" And then five minutes later they called them
14 back and said, "Okay. Give me everything you've got." And
15 they dispatched the demand response. I shouldn't use that
16 term, they didn't dispatch it. It was out of the market.
17 They took the demand response on the load side. They got
18 about 940 megawatts. That number might change as they
19 drill down further, but about 940 megawatts of emergency
20 demand response on May 3rd at 7:00 p.m. and that prevented
21 blackouts.

22 So to my knowledge most of the CLECA members were
23 part of that 940 megawatts of emergency demand response
24 that dropped the load. CLECA's aggregate annual demand is
25 450 megawatts about, depending on the economic cycles. And

1 so we think it's really important to keep that emergency
2 demand response as an option for the entire state. It's
3 critical to keep it for the customers' sake. It helps them
4 with their electric costs. It's critical to keep it for
5 avoiding emissions leakage. You keep that manufacturing in
6 the state by giving them that DR tool to manage. And it's
7 also critical for the reliability of the system grid.

8 That's on one hand.

9 On the other hand, we can't just rely on
10 emergency demand response to bale the Grid out every time.
11 There's only so much disruption an industrial customer can
12 take, because they want to focus on making their widget.

13 So in the future, I hope we don't have blackouts
14 or skyrocketing rates or increased carbon. I really do
15 hope that the structure of the retail market allows for
16 full competition, particularly for the industrial customer
17 classes. I like what my colleague from the UC system
18 suggested, reopening DA, looking at ways that we can do
19 that. I think that with real retail choice the ability to
20 choose among distributed generation, CCAs, DAs, ESPs and
21 IOUs, customers can vote with their ratepayer dollars. And
22 under each option, there should be robust DR.

23 I want to end on one note, a real concern that
24 industrial customers have about the regulatory structure
25 and the regulatory model. And that's risks around data.

1 Industrial customers operate in competitive markets. And
2 their usage data is commercially sensitive and market
3 sensitive. And particularly how much an industrial
4 customer uses on a particular site, that needs to be
5 maintained and kept as confidential and private data. It's
6 currently subject to the 1515 Rule under the CPUC
7 requirements. And I know that there's some discussion
8 around changing that, so parties can plan for their climate
9 action plans.

10 However, I've got to emphasize that confidential
11 customer usage data, particularly for industrial customers
12 in competitive markets, needs to be protected and
13 maintained. And I'll look forward to our later discussion.
14 Thank you.

15 MR. CAVANAGH: Thank you.

16 Our final panelist is Julien Gervreau who is the
17 Director of Sustainability for Jackson Family Wines.
18 Julien?

19 MR. GERVREAU: Thank you, good morning. I'm here
20 filling in for Katie Jackson today, who sends her regrets.
21 She could not make it.

22 My name is Julien Gervreau. I'm the Director of
23 Sustainability for Jackson Family Wires. We're a family-
24 owned wine company based in Santa Rosa. We have 1,500
25 employees and we currently purchase electricity from CCAs

1 in Sonoma, Mendocino and Napa Counties primarily because we
2 believe in their charter goals of providing a greener mix
3 of energy while reducing greenhouse gas emissions at a
4 competitive rate. And ultimately reinvesting those
5 ratepayer dollars back into the local economy.

6 We're also the largest generator of solar
7 electricity in the American wine industry. It pales in
8 comparison to what the UC is doing, but we have six-and-a-
9 half megawatts of onsite renewables installed across nine
10 wineries throughout PG&E service territory. And these
11 arrays were financed in large part through energy
12 efficiency savings via PG&E's Wine Industry Efficiency
13 Solutions Program, which in many ways helped tip the scales
14 for us from a financial perspective to invest in energy
15 efficiency.

16 So the types of steps that we ultimately view as
17 important to the structure of a future retail electric
18 market, our asks have been couched in my comments below
19 under each priority.

20 So for us, our first priority is for the CPUC to
21 take a consistent stance with regard to distributed
22 generation rates. Recent changes to rate schedules and
23 time of use periods have artificially devalued the
24 electricity provided by PV assets that we've installed
25 effectively dis-incentivizing us to install more solar.

1 Most of the solar we've already installed is on the A6 rate
2 schedule, which is no longer available to large commercial
3 customers. And recent changes to NEM 2.0 and the proposed
4 change to move the peak time of use period to later in the
5 day all ultimately compound to make solar less profitable
6 for us moving forward.

7 As a private company, we make our solar decisions
8 on based on 25-year cash flow projections. So changing
9 time of use periods with just a ten-year grandfather clause
10 has a negative impact on our financial calculus. And
11 ultimately if we can't predict, with some common sense,
12 what our rates are going to look like in the future it
13 makes it difficult for us to invest. All this being said,
14 we're looking at installing an additional five megawatts of
15 onsite solar over the course of the next few years, in
16 support of our own internal sustainability goals to be 50
17 percent powered by onsite renewables.

18 So our ask is really to help make this process
19 smoother by protecting the value of each kWh that we
20 generate through onsite renewables.

21 Our second priority is to really partner to
22 increase the renewables mix on the Grid while keeping
23 electric rates stable and service reliable, which is kind
24 of the holy grail that we're all here to talk about. But
25 essentially for us as a family-owned company, committed to

1 the long-term stewardship of our lands and our communities,
2 our interest is in supporting California's transition to a
3 carbon-free electric grid in the most cost effective manner
4 possible.

5 Fortunately, solar and wind power are among the
6 most inexpensive energy sources available today. So it
7 stands to reason that the CPUC should be doing everything
8 it can to support the proliferation of those generation
9 sources.

10 Looking beyond solar, onsite battery storage is
11 one of the next technology developments that we see as
12 critical to helping expedite the transition to a carbon-
13 free electric future. We've installed currently over four
14 megawatts of batteries across six wineries that we have in
15 California. And we're currently leveraging them to
16 mitigate costly demand spikes. And we also participate in
17 demand-response as well.

18 Unfortunately, the financial benefit of these
19 batteries is greatly diminished when you factor in our
20 solar arrays, because those solar arrays also eliminate
21 base load for us. So from our perspective a better model
22 would be for us to store excess solar energy that we
23 generate from our solar panels during the day in our
24 batteries. And power our wineries with that excess energy
25 at night, which is not currently feasible from a cost

1 perspective.

2 So while this may seem contradictory to our first
3 ask of protecting our solar investments, what we really
4 want is more options that ultimately enable us to explore
5 the best way to integrate solar, storage, and whatever's
6 coming next down the pike.

7 The duck curve has been referenced here a few
8 times today and it's often been used as an argument against
9 continued investment in solar. But for us we really view
10 it as a lean in opportunity for two reasons. One, as I
11 mentioned it costs less to generate solar electricity today
12 than any other energy industry. So from our standpoint the
13 CPUC should be supporting it continually. And two, battery
14 storage technology, we view it will be an important
15 component to smoothing out the duck curve. But right now,
16 as I mentioned it's just not cost effective, under the
17 current rate system.

18 So with those two realities in mind, we'd like to
19 push the CPUC to consider a couple of the following what if
20 scenarios. First, being what if the CPUC created optional
21 rates for us to experiment with so test the cost and the
22 benefit of emerging technology, like batteries to pair with
23 solar to help them pencil easier. You know, what if the
24 CPUC made electric vehicle charging free from noon to 5:00
25 p.m. and kept that decision stable for the next ten years?

1 That would see us as an organization, we would install more
2 charging stations at our offices and our wineries and a
3 field of dreams scenario, our employees would buy more
4 electric cars. And ultimately, what if the CPUC used the
5 duck curve's excess solar energy to incentivize things like
6 hydrogen generation to fuel carbon-free cars? We have all
7 this excess solar on the Grid, let's lean into it.

8 But the biggest question mark for us is we really
9 don't know how all these options will be most cost
10 effective until we try them out, until we kick the tires on
11 them, as it were. So really our second ask is for this
12 optional rate class that helps better reflect what the
13 energy generation usage curves look like at specific times
14 of day, so we can kind of help explore these opportunities.

15 Our third priority is for you all to -- and I
16 think I'm echoing a lot of my colleagues on the panel here
17 -- is to really support a level playing field for PG&E, for
18 CCAs and for ESPs to all compete.

19 And from our standpoint, we recognize the role
20 that we play, as an employer of choice in supporting our
21 local communities. We ultimately believe that every dollar
22 we invest in our employees will be amplified in
23 strengthening and building community resilience and CCAs
24 are very similar in this way. Because of their community
25 center charters CCAs provide ancillary benefits that

1 support reinvestment in the local economy and address the
2 needs of local communities that the CCA serves.

3 For example, Sonoma Clean Power recently
4 negotiated favorable pricing terms for local car
5 dealerships to get a lot of people in Sonoma County into
6 electric vehicles. I understand they're doing it again
7 later this year. And I salute those efforts, because those
8 are things that shareholder organizations don't necessarily
9 reinvest in. So we fully support a marketplace in which
10 competition is fostered and encouraged. But we ultimately
11 advocate that consideration needs to be given to any
12 unforeseen consequences, impacts, that this could have both
13 on PG&E and CCAs.

14 Some of the things that we're concerned about are
15 scenarios where if we open the market to more direct
16 access, providers they'd cherry pick the most profitable
17 commercial industrial without considering the rest of the
18 ratepayer classes. And will it ultimately lead to a
19 scenario whereby PG&E creates new costs? We all saw the
20 PAM charge that came out this month. And I think you could
21 make an argument that new players into the market create
22 questions about the value that things like that, that those
23 services provide.

24 And ultimately most importantly, how will all
25 this ultimately impact PG&E's ability to maintain reliable

1 service at all times for all customers, which is written in
2 the white paper. So we're fine without adding more players
3 in the field, as long as the playing field remains level.

4 Another thought is could you create a structure
5 whereby PG&E and CCAs are ultimately able to bid on a
6 direct access portfolio in a competitive way with the
7 direct access providers? And if you're going to allow more
8 ESPAs into the marketplace, our standpoint is you need a
9 degree of regulation in place that protects all of us
10 against the destabilization of the customer base, because
11 we've all been down that road before.

12 Thank you for your time.

13 MR. CAVANAGH: I think all of my panelists.

14 So President Picker, Chair Weisenmiller, it's
15 hard for me to imagine you won't have a word or two to say
16 in response.

17 PRESIDENT PICKER: Well, the first thing I'll
18 just observe is that there is no clear consistent voice
19 from customers as to what they want. They want it all.
20 They want it the way they want it. And they want it now.
21 (Laughter.) So I just want to go back to --

22 MR. CAVANAGH: I hope you don't think that was my
23 fault, Mr. President.

24 PRESIDENT PICKER: No, it's in the nature of
25 Californians. So Ms. Cervas and Mr. Hawiger, you didn't

1 really seem to talk much about the potential for self
2 generation, so phenomenon such as the UC or some of Mr.
3 McRae's customers who seem to be the populist voice of just
4 departing entirely and going their own way. What does that
5 do for some of the programs that you think are important,
6 particularly for the EJ community? What happens when large
7 customers or large numbers of small customers through
8 rooftop solar and through micro grids actually leave the
9 Grid? How do we actually finance those carve outs? How do
10 we actually finance the programs that low-income customers
11 depend on? Where does that come from? How do we do that?

12 MS. CERVAS: So I have a couple of ideas. With
13 respect to direct access, one of the things that we've been
14 advocating for is a lot more local distributed generation.

15 What we see, the trend has been historically --
16 is in renewable energy programs is to focus more on the
17 large scale utility scale model, which I know some of the
18 panelists focus on. For us, because we are really focused
19 on the communities that have not been able to benefit in
20 the renewable energy market, is looking at the communities
21 that are most impacted by fossil fuel and have the most
22 opportunity and the most at stake in them, so which are the
23 environmental justice communities.

24 So we've long advocated for local distributed
25 generation that is smaller scale, specifically one megawatt

1 or less. And so with the model that is larger scale that
2 might not penetrate disadvantaged communities at the local
3 level. That said, we again as I mentioned, support models
4 such as community solar or shared solar, which are a little
5 bit larger, but within disadvantaged communities.

6 To the point around financing, I mean that is a
7 huge debate conversation within the California
8 Environmental Justice Alliance. It's something that we've
9 made a priority to look at, investigate in, and then
10 support policies around looking at financing models
11 specifically for local distributed generation in
12 environmental justice communities.

13 We've looked at anything from Cap and Trade
14 funds, obviously the Greenhouse Gas Reduction Fund to the
15 EPIC funds at the California Energy Commission. And having
16 a specific percentage of those funds directed towards the
17 Spanish communities and low-income communities. It's a
18 variety of number of things.

19 So those are some things that we've looked at,
20 but it is a huge debate in our coalition.

21 MR. CAVANAGH: I think Nora had a comment.

22 MS. SHERIFF: Thank you. President Picker, I
23 would like to take a stab at offering up a response as well
24 if you're looking at the funds for the CARE, low-income
25 energy efficiency, and energy efficiency funding and

1 expressing some concern about the loss of ratepayer dollars
2 for those programs. I'd just like to note that for
3 customer generation departing loads for industrial
4 customers, which are larger installations, three megawatts,
5 five megawatts, ten megawatts, fifty megawatts, normally
6 they still pay the public purpose program charge for the
7 load that that's departed, on top of the service that
8 they're still taking.

9 So the way it's structured right now, for better
10 or worse, if a customer invests its own private capital in
11 say a bottoming cycle combined heat and power installation
12 that uses waste heat recovery to produce energy, they'll
13 not only pay for that customer generation, they'll also
14 still pay a public purpose program charge on that ten
15 megawatts, on that twenty-five megawatts. And that will go
16 to fund the low-income CARE program, low-income energy
17 efficiency and also the energy efficiency programs.

18 PRESIDENT PICKER: So you're advocating that we
19 lump onto that departing load charge, new future programs
20 for carve-outs in disadvantaged communities?

21 MS. SHERIFF: Not necessarily, I think it's
22 something that needs to be looked at, in a holistic
23 perspective, right?

24 I think the rulemaking that is hinted at, at the
25 end of the staff paper, says we're going to look at all of

1 these issues. And I think departing load charges is one of
2 the critical issues that needs to be looked at in a
3 holistic fashion.

4 PRESIDENT PICKER: Sorry, I thought I had just
5 solved your problems.

6 COMMISSIONER GUZMAN ACEVES: What about demand
7 response, how is that any different? You do want the
8 demand response costs to be covered in those shared costs.

9 MS. SHERIFF: Those are covered through either
10 the distribution rates or the generation rates, not through
11 the public purpose program charge.

12 COMMISSIONER GUZMAN ACEVES: No, but in terms of
13 what's incorporated into PCIA?

14 MS. SHERIFF: No, I don't think demand response
15 costs are recovered through the PCIA.

16 MR. CAVANAGH: Well, Marcel is about to solve
17 this problem.

18 MR. HAWIGER: Well, I think if I may just drill
19 down a little bit, I think, President Picker, you're asking
20 specifically about some of the public purpose programs.
21 And I tend to agree with Ms. Sheriff that the Public
22 Purpose Program Surcharge is designed to do that. It's a
23 non-bypass able charge.

24 And I think it's a workable solution, but it
25 creates -- definitely politically it was a huge fight,

1 especially for net energy metering customers who were
2 exempt from paying, historically from paying the public
3 purpose program. And now under NEM 2.0, they pay about
4 half of it, but they don't pay the other half. And I think
5 that is a problem and it will continue to be a fight.

6 But I think there is a workable solution to that.
7 I do think there's a separate issue rather than paying for
8 public purpose programs, the issue of maintaining
9 indifference for historical procurement costs, which is
10 what the PCIA is intended to do. It covers basically
11 procurement costs from contracts that utilities sign to
12 serve certain customers. And I think that issue is
13 obviously a huge fight.

14 In the context of CCAs, I think it will require
15 probably some changes. I think it can be solved, because
16 at least you know sort of the customers who move to the
17 CCA. They were there at some point and they went to the
18 CCA, hopefully they'll stay with the CCA.

19 I think if you have more direct access, it
20 becomes a hugely more complex equation. Because how do you
21 figure out what customers you bought for when the customer
22 might be a CCA customer this year, then move to an ESP,
23 then move back to a CCA, or they were a utility customer
24 and then CCA comes in. But then they move to an ESP
25 provider. And then just the tracking of who's customers

1 were included in load forecast in a particular year becomes
2 enormously more complicated.

3 But that's a different issue, the PCIA issue from
4 the public purpose program charge to pay for public purpose
5 programs. Though that will continue to be an issue and I
6 think it's part of the issue of net energy metering.

7 And for in terms specifically rooftop solar, TURN
8 does believe that the present system is not sustainable.
9 It's not fair to customers, because different customers get
10 different subsidies depending on how much they generate,
11 how much they consume. Because they get paid for their
12 solar exports if they're residential customers, depending
13 on where they are in the tiers.

14 Later it'll be TOU. If you're a CARE customer
15 you get to pay less, because your retail rate is less,
16 because your retail rate is less, so you get less subsidy
17 from net energy metering and ultimately it's a subsidy from
18 those who don't have solar to those who do. And I'm happy
19 to talk more about that, but I don't think it's a
20 sustainable system the way it is.

21 PRESIDENT PICKER: So --

22 COMMISSIONER PETERMAN: Well, go ahead.

23 PRESIDENT PICKER: I was going to move to a
24 different question, but if this is --

25 COMMISSIONER PETERMAN: Well, it's kind of

1 related to this question.

2 CHAIRMAN WEISENMILLER: Yeah, actually I have one
3 on this question too, so why don't you go forward, Carla?

4 COMMISSIONER PETERMAN: I think the other aspect
5 of self-generation that I'd appreciate the perspective of
6 Mr. Hawiger and Ms. Cervas on, is how do you do liability
7 and integration? So we've moved from this paradigm where
8 our generation resources also provided reliability in their
9 constant production. And so if you move to a situation
10 where you have primarily distributed generation and local
11 communities, are you envisioning then that those renewables
12 are integrated with local resources as well, such as energy
13 storage? Or are you envisioning that there's a roll for
14 utility of third-party entity or some type of market to be
15 providing broader reliability services that are not
16 localized to support that local generation?

17 PRESIDENT PICKER: And I'll have an add-on
18 question. Because I was --

19 COMMISSIONER PETERMAN: Because that's where you
20 were going right?

21 PRESIDENT PICKER: Yeah. Well, really bluntly
22 what are you doing between 9:00 a.m. and 11:00 a.m. on
23 August 21st? Particularly for those who are self-reliant,
24 self providers, Jackson Winery and PUC?

25 COMMISSIONER PETERMAN: That's the solar eclipse

1 for anyone who's not following that wonkyness.

2 MR. BYRON: So what are you doing between 9:00
3 a.m and 11:00 am.?

4 MR. BYRON: What, 9:00 a.m. to 11:00, you mean
5 during the ramping period?

6 PRESIDENT PICKER: Solar eclipse, Northern
7 California. You're going to lose 75 percent of your solar
8 capacity, Southern California, 62 percent.

9 MR. BYRON: That's right. Well, we schedule our
10 energy out of the California Independent System Operator,
11 so the Grid balances the load.

12 PRESIDENT PICKER: Ah, okay.

13 MR. BYRON: We purchase research adequacy to
14 ensure the reliability system. We purchase in excess of
15 our expected demand, based on a 15 percent reserve
16 requirement. And we also buy flexing ramp to ensure that
17 we're part of the solution.

18 PRESIDENT PICKER: You're going to have a heavy
19 morning ramp too.

20 MR. BYRON: And we're going to have a super-heavy
21 morning ramp up.

22 COMMISSIONER PETERMAN: I'll just note that I
23 think this one of the issues that's different from the
24 first time, when we thought about retail choice, which is
25 the intermittency of the generation. And what that means

1 in terms if there's a market solution for that, what is the
2 competitive market look like, to for example deliver the
3 emergency response that we talked about on May 3rd. And
4 that's what I'm trying to marry this idea of a -- and
5 really understand the vision that CEJA has in terms of
6 distributed energy and how that fits into a broader
7 reliability framework.

8 MS. CERVAS: Yeah, no I mean I think that it is a
9 mid-term to long-term model, obviously we're not going to
10 get there this year, next year, whenever. But we do
11 support -- I mean, one of the things that we're looking at
12 in a couple of the different programs and policies that
13 have been passed most recently are marrying solar and
14 storage. And so we do support storage.

15 We have looked a lot at the micro grid model.
16 But in the micro grid model, and any solar plus storage
17 model and how that concretely benefits or gets into
18 disadvantaged communities, there are a couple of micro
19 grids. For example, in L.A. where I'm based, there's --
20 but what we look at are, are those systems getting into
21 disadvantaged communities and how is it supporting both the
22 reliability and really our approach has been more to look
23 at the benefits in the system.

24 COMMISSIONER PETERMAN: And I'll just note to
25 that point, for those who aren't aware, in a recent energy

1 storage decision the Commission adopted we directed Edison
2 to convene a working group on community storage with
3 particular focus on disadvantaged communities, both pretty
4 early on in that concept I would say.

5 MR. HAWIGER: If I can chime in?

6 CHAIRMAN WEISENMILLER: No, let me start on
7 something to try to, at least -- it seemed like one of
8 these, Marcel, you were making direct access out of, "Oh,
9 my god. The industrials are going to leave."

10 And I think President Picker's premise going into
11 this was, "Look the procurement function at this point is
12 not a utility function." If UC wants to install solar
13 everywhere, that in terms of the conception impact of that
14 or energy efficiency or whatever, I mean direct access is a
15 tool for them. But it's not the only way that they can
16 substantially reduce their utility service.

17 So again that's the reality at this point, is
18 procurement options much broader than just it's either
19 utility or direct access. And so that gets to your point.
20 It's like what's the net in difference (phonetic) when they
21 leave? But again you have to be thinking about this is a
22 new world, but the other part of that new world is the
23 provider of last resort, which we haven't talked about yet.
24 But again the utilities are sort of semi-social animals
25 that have been regulated long enough. They have no problem

1 as the provider of last resort. And there are regulatory
2 mechanisms to make sure that all customers are taken care
3 of.

4 But a lot of these new entrants don't have those
5 constraints or those obligations, so how do we deal with
6 that?

7 MR. HAWIGER: Well, I understand they have
8 different options. But presumably we're talking about the
9 options they have for self generation tend to be clean,
10 renewable options, either through solar or some of the
11 other programs that have been partly subsidized by this
12 Self Generation Incentive Program or whatever.

13 Assuming we're not looking for a future where
14 lots of customers build diesel fired self generators, but
15 putting that aside I don't see that as a problem. Because
16 essentially what we're looking at is how do we plan to
17 ensure that the energy of whatever entity is purchasing in
18 the wholesale market for resale to customers that, that
19 energy is 50 percent or 60 percent and eventually 80
20 percent or more renewable and clean energy.

21 Now, if there is self generation, lots of self
22 generation, the remaining portion becomes smaller and
23 smaller. That's fine as long as we can figure out how to
24 ensure that whether it's the utilities or LSEs actually
25 construct new renewable generation that's clean that will

1 meet the net load, and I mean renewable and net of self
2 generation. And I just don't think they can do that. You
3 can do that planning function or at least right now, we
4 haven't figured out who can do that planning function if
5 you re-open retail competition. And I think it's just
6 going to be a mess.

7 CHAIRMAN WEISENMILLER: Well, but again it's any
8 number of Tim's people have just said they're going 100
9 percent renewable now. And they may choose to do it with a
10 large scale. They may deal with it onsite. But it's
11 happening really fast right now with direct access.

12 MR. HAWIGER: Then I think we have to ask what
13 does that mean when you say they're going to do 100 percent
14 renewable. It's the same question we've had with some of
15 the early CCA programs, it's the same question we had with
16 retail choice the first time. If you're not self
17 generating are you buying renewable energy credits from
18 Wyoming Wind, from Oregon Wind, from facilities that have
19 existing contracts and would generate anyway?

20 But they're very happy to do the resource
21 shuffling. They're happy to get a premium schedule. They
22 say that they're selling power to you and buy dirty system
23 power to replace the energy under the contracts they have.
24 Is that what we want? Do we want large hydro and wind from
25 the northwest that then we pay a premium for. And say we

1 get it, it's clean. But there's zero change in renewable
2 energy when you look at the integrated energy system.

3 That's the central issue is are we going to
4 really create new renewable energy across the entire west,
5 or are we just shuffling resources by allowing for
6 contracting that meets vague clean energy goals, but has
7 not enough specificity and accountability that we can
8 really say anything is changing for greenhouse gas
9 reductions in this area.

10 MR. CAVANAGH: Julien?

11 MR. GERVREAU: Yeah, I'd like to just comment on
12 that because we're -- I'll give you a real world example of
13 where we are with that exact issue.

14 We're kind of exploring how we can achieve our
15 renewable energy goals and presently they're set at 50
16 percent. But just in looking at our energy consumption, I
17 know that it would take about 15 megawatts of solar
18 generation for us to be able to offset 100 percent of our
19 energy usage. And we actually have land that is not
20 dedicated to vineyards that would actually be perfect for
21 that. And if you look at it, our challenge is how do you
22 be able to take the land that we own, the generation that
23 we need, the space that we potentially have. But then look
24 at that in a way that will work for us from a cost
25 standpoint?

1 I mean right now, the options are a feed and
2 tariff program where we don't even own the RECs so we can
3 claim to be a host of the program. And generate at
4 wholesale rates which is not going to really excite my CFO.
5 So I mean just looking at, I mean how do we all work
6 together to figure that out, because we're essentially --
7 we have the space, we have the desire, we have the will.
8 But our other option is to do some sort of a virtual PPA
9 with some wind farm somewhere in, not California. So how
10 does that --

11 PRESIDENT PICKER: Well, I'm not opposed to all
12 those things. But aren't you, in effect, still just
13 arbitraging the existing dominant utility market system?

14 MR. GERVREAU: I mean this particular area is
15 near a major city that has a ton of demand.

16 PRESIDENT PICKER: Okay. But you're still using
17 the utility infrastructure to set a market that you can
18 sell to them to resell.

19 MR. GERVREAU: Under the current system, yes.

20 RESIDENT PICKER: Okay.

21 MR. GERVREAU: Yeah.

22 MR. CAVANAGH: Mark, did you have something?

23 MR. BYRON: Yeah. There was an interesting
24 statement I heard, just to give a different perspective.
25 The duck curve has a interesting environmental impact.

1 MR. CAVANAGH: Oh, hit your microphone.

2 MR. BYRON: Oh, sorry. Is that better? Yeah, so
3 the duck curve from my perspective has a interesting
4 statement if you look at it. It kind of means the marginal
5 environmental benefit at that point in time is zero.
6 Meaning if you add another solar plant there's going to be
7 no change in the CO2 emissions, because you're decking,
8 you're basically reducing CO2.

9 So there is a big criticism buying renewable
10 energy from out-of-state and a big criticism of renewable
11 energy credits. Renewable energy credits are evidence of
12 the production that's tracked in WREGIS. It's you buy it
13 long-term or short-term, but a project, a wind project from
14 out of state in a state still consumes coal, that still
15 consumes lignite, basically has 2,200 pounds of CO2 per
16 megawatt hour marginal benefit. So it might reveal itself
17 in the form of a REC to the buyer, but that REC probably
18 had a better environmental benefit than a additional solar
19 project in California in April.

20 MR. HAWIGER: So if I may just? I think the REC
21 has value only if it would not have been produced, but for
22 your contract and that's always the central issue. Is it
23 actually additional renewable energy?

24 MR. BYRON: But you can't abandon the existing
25 fleet of renewable generation. And the way they get

1 additional revenues is through things like resource
2 adequacy for liability and RECS for a renewable attribute.

3 MR. HAWIGER: Well, why don't we just --

4 PRESIDENT PICKER: Why don't we just assume that
5 there's a disagreement about the value of the RECS in the
6 system and see if there are other questions.

7 MR. BYRON: Yes.

8 COMMISSIONER PETERMAN: I was ready to jump in
9 about that.

10 MR. HAWIGER: Could I just chime back in a little
11 bit about rooftop solar and this local reliability issue,
12 if that --

13 COMMISSIONER PETERMAN: Yeah

14 MR. HAWIGER: One thing I want to say is from the
15 big picture perspective TURN looks at net energy metering
16 and self generation, lots of these programs including CARE
17 as subsidy programs. And we try to take a sort of public
18 interest perspective. You know, CARE is a subsidy for
19 individuals, because it allows them to get affordable
20 energy. And they face huge risks of disconnection,
21 otherwise and no electricity service.

22 Net energy metering, energy efficiency, those are
23 all various subsidies that go to individual customers who
24 get individual benefits through bill reductions. We tend
25 to look at those and think, "Well, is there value to it?"

1 Is there a social value to it? Are you actually reducing
2 energy use or generating renewable energy at a price that
3 is better than having the utilities build something or buy
4 something?

5 And I think this issue that Mr. Gervreau brings
6 up about solar is just that. He would like to get better
7 subsidies for their onsite solar and then they're producing
8 clean energy. And I understand that. And they're getting
9 direct benefits from it. That's good.

10 But then my question is well, if we're going to
11 give greater subsidies through redesigning net energy
12 metering or some other program, is it really worth to us in
13 terms of achieving clean energy goals? Why should we do
14 that instead of having the utilities contract for utility
15 scale solar or even providing different incentives for
16 everyone else, under net energy metering.

17 So that's how we look at it in the big picture.
18 And I think net energy metering is a big question. But in
19 terms of the reliability issue I would just say I think
20 your original question -- I'm going to punt on the eclipse,
21 because god knows, I'm assuming we know that. You know,
22 there's enough foreknowledge and we have enough excess
23 capacity. I haven't looked at the numbers at all, but I'm
24 assuming even if we have to ramp up some of our gas-fired
25 generation for two hours or four hours in the year, so be

1 it.

2 But the local, I'm not -- then there's also the
3 big problems of solar in terms of the ramp and over
4 generation. Again, right now there's no shortage of
5 flexible capacity for several years down the line. So I'm
6 not sure whether the local reliability question was
7 something different from those system impacts. And we
8 certainly don't see any impacts right now from rooftop
9 solar on local reliability, and in terms of either voltage
10 or backflow through the substations. And that's certainly
11 an issue that I know the Commission is dealing with in the
12 distributed resources proceeding and with Grid
13 modernization. And we hope to be a part of that solution.

14 COMMISSIONER GUZMAN ACEVES: Well, can I follow
15 up on that, because I think potentially Commissioner
16 Peterman was heading towards -- we have this question
17 before us a lot lately about cleaning up the local
18 reliability. And how much of that, as you were alluding to
19 in your earlier examples of NEM -- you know, the public
20 purpose programs, NEM, DR, to a certain level those are all
21 subsidized with the entire base of the utility rate base.

22 And when we look at reliability and how we're
23 currently meeting those needs, and we're going into a place
24 where all these different providers are meeting their own
25 reliability needs to direct requirements to the ISO, what

1 role is there in a shared cost to getting to a clean RA
2 scenario? Is that possible with this future of very
3 different providers in one region? How do we do that kind
4 of planning coordination?

5 And, Nora, you kind of talked about a little bit
6 of a vision of this of how you continue to require DR. Do
7 you require it as a shared base as you would a public
8 purpose program or do you require it from each individual
9 CCA IOU? That planning looks really cumbersome.

10 MS. SHERIFF: I think it would depend on the type
11 of DR. And that's why I was alluding to meeting a
12 multiplicity of demand response options. I think there's
13 one level of the system emergency DR. And that's a model
14 that the State of California is very familiar with, has had
15 since the 1980s.

16 I think there are new innovative models coming
17 out of the market. The ISO wholesale market for proxy
18 demand response resources that could be provided by a lot
19 of different demand response providers be it a CCA
20 contracting with the third party DR, be it a third party
21 aggregator going through the investor owned utility, be it
22 an energy service provider that is also using that third-
23 party aggregator.

24 I think what we need to do is we need to be open
25 to all of these new types of demand response. And I would

1 actually take some exception to the concept that demand
2 response is subsidized, because it does through the cost
3 effectiveness test that the Commissions established. And
4 so most of the programs are cost effective. And if you
5 look at it on a portfolio basis, the programs that are more
6 cost effective bring the programs that are less cost
7 effective, up to that cost effectiveness standard.

8 COMMISSIONER GUZMAN ACEVES: Yeah. No, I agree
9 they're cost effectively, absolutely. But you're basing it
10 on the bigger -- your cost effectiveness test is of shared
11 amongst a lot of customers --

12 MS. SHERIFF: Right.

13 COMMISSIONER GUZMAN ACEVES: -- and if we're
14 going to parse those out, maybe a certain investment in
15 like a large industrial user cost effectiveness is no
16 longer there.

17 MS. SHERIFF: Well, and again that's where I was
18 thinking we would go to different strata of demand response
19 programs. What do you need for the entire system for
20 reliability might be different from what you need to
21 arbitrage on price in the day ahead market, so different
22 types of demand response programs might have different
23 funding sources.

24 MR. HAWIGER: If I may just add, at the moment
25 the reliability demand response that Ms. Sheriff is talking

1 about is funded -- if any customer can participate then
2 it's funded through distribution rates. Everybody pays for
3 it. There's no problem. So and in terms of it's a system
4 reliability issue, not so much like a local circuit
5 reliability issue at all, but I would just add that I think
6 we have some different perspective on demand response.

7 TURN has always supported some of the emergency demand
8 response. And the question is how much do we pay for it?

9 I think Ms. Sheriff is right. It's been around
10 for a long time and it's basically been at certain times of
11 economic development rates for large customers who get paid
12 a lot of money, so that they can drop load. Their load
13 drop is great. It's valuable. I like it.

14 But the question is how do we value it? How do
15 we pay for it? And we've promoted going through a more
16 competitive market for that. That is an area. Energy
17 efficiency demand response, those are areas where there's a
18 lot of actors. Where those parties can aggregate
19 customers, sign up customers, and provide demand response
20 services. But the question of why do we have an
21 interruptible rate? We have an interruptible rate, because
22 energy by itself is not that valuable if you drop it only a
23 few hours a week. So you've got to have some kind of
24 capacity payment for demand response.

25 And an interruptible rate is one way of doing it.

1 Having where the Commission has now piloting the demand
2 response auction mechanism, which is another method where
3 third parties can aggregate even interruptible customers
4 that we haven't gone there yet and bid them in to get
5 capacity payments. And bid them into wholesale market and
6 perhaps reduce costs that way.

7 CHAIRMAN WEISENMILLER: So I was going to cede my
8 next question to Ralph, seeing as he's been so patient.

9 MR. CAVANAGH: Well, I will not accept that
10 invitation if there's one other Commissioner who has a
11 question. So let me just check, yes?

12 COMMISSIONER MCALLISTER: I have a very quick
13 follow up on this demand response discussion. I mean
14 personally, I think demand response has to be a big part of
15 the solution or we're going to overinvest in other things
16 that are heavy hardware costs. You know, the costs of
17 battery storage are going to come down. But it's not low
18 yet. And demand response, all the technology is there to
19 do it. But we have this kind of fragmented marketplace.
20 We have a lot of different kinds of demand response. And
21 some of it's probably necessary from a technical
22 perspective.

23 But I guess how do we create markets for demand
24 response, so that demand response 2.0 and 3.0 aggregators,
25 not the 1.0 that is calling off a telephone and flipping

1 switches, which is necessary. How do we incorporate those
2 into the market in a way that they can actually make a go
3 of it and make some money?

4 Because I hear from these providers that they
5 have all this great technology that they're working with
6 customers behind the meter. They could provide automated
7 daily very effective demand response to the Grid, but there
8 are no signals that let them create cash flow from that.
9 So I guess my question is do you have thoughts, any of you
10 have thoughts, on how that marketplace can be specified
11 such that it is viable?

12 MR. CAVANAGH: Nora?

13 MS. SHERIFF: Thank you. I have one thought that
14 I'd like to offer. And this is something that CLECA has
15 suggested a couple of times in a couple of different
16 proceedings. And that is to try to incent load, not just
17 to drop, but also to increase.

18 I think right now the difficulty is the lack of a
19 price signal. If we could get somehow through an optional
20 dynamic rate overlay, and say just for the generation
21 component of the rate, not the wires component. But say
22 just for the generation component of the rate let those
23 customers who can increase their load, and help soak up
24 some of the excess renewable generation when wholesale
25 market prices are low or even negative, I think that would

1 be a great way to turn on that market. And allow customers
2 to really access the benefit, allow customers to lean into
3 the duck curve and help soak up some of the excess
4 renewable generation. But that's a different type of
5 demand response than we've ever had before.

6 And I know that smart people are working very
7 hard on it, at the ISO and at the Commission. But I think
8 that should be an area of real focus, demand response that
9 ramps up load, not just the traditional demand response
10 that ramps down. So that's one rate design option, I
11 think, that we could look at.

12 I think there's a lot of different technology
13 aggregators out there. And there are different ways that
14 you can try to platform that to enable equal access for all
15 the different technologies.

16 MR. CAVANAGH: Marcel?

17 MR. HAWIGER: Yeah, I would add that right now,
18 the utilities spend about roughly 100, 120 million a year
19 on demand response. About a third of that is for
20 technology incentives. For large customers to put in auto
21 demand response technologies, etcetera, so we're getting
22 some of that capacity in there. There's an inherent
23 tension. It's hard to pay a lot of money for demand
24 response right now, in an era of large amount of excess
25 capacity. So there's a certain amount of tension there

1 that will not go away, because the promise of demand
2 response is we're counting on it in our long-term planning.
3 And so presumably, 15 years down the line, 20 years down
4 the line, you'll have less generation, because you're
5 counting on demand response. And then prices will go up
6 and perhaps we'll be paying them more.

7 But I want to offer one other sort of thought. I
8 wonder if can you put my presentation back up please, I'm
9 sorry. I just wanted to show you two slides as just
10 something to think about in this area, with respect to
11 residential customers. Because there's always been a hope
12 that residential customers, especially with air
13 conditioning can provide that demand response. And so two
14 slides -- and however in its current application, Edison
15 for example is actually saying, "We're really worried about
16 using." In the future, in theory, if you rely on demand
17 response more you're going to have to call it more. You're
18 going to call it a lot more hours, because you're going to
19 actually be using it instead of peaker plants.

20 But Edison is saying right now in their Summer
21 Discount Program, which is their air conditioner cycling
22 program -- this is from their testimony and their
23 application they just filed the beginning of this year.
24 They say that they've seen attrition from residential
25 customers, because they've been calling the program rather

1 than 0 hours or 20 hours, they're calling it 30 to 35 hours
2 in 2014-2015.

3 Now, to me that's still a very low number of
4 hours. I don't know if it's really true that it's because
5 of this that customers have been dropping off or if there
6 are other reasons. But Edison seems to be saying -- and
7 Edison's program gets dispatched for two or four hours and
8 most of the customers have signed up for 100 percent
9 cycling, which seems a little extreme to me. I've never
10 really supported the 100 percent cycling, but they pay them
11 more so they sign up more and now they're losing them. But
12 their notion seems to be that we need to call customers for
13 four hours at 100 percent or there's no value.

14 Now, I'm on the Ohm Connect Program. Ohm Connect
15 is one of the third parties that is aggregating residential
16 and non-residential load and getting contracts through the
17 DR, distributed resources auction mechanism process. I get
18 messages twice a week, pretty much at least, that it's an
19 ohm hour tonight, since February.

20 They seem to have a very different model. Now
21 it's all one hour and it's happens all the time. I don't
22 know, which one is right? Is Edison right in terms of the
23 value and how often you should call customers? Or is Ohm
24 Connect right that you can call them a lot, but it's only
25 for one hour. So that's something that I think hopefully

1 the Commission will be reviewing and Energy Commission will
2 be analyzing some of those data. There's going to be lots
3 of data that will be coming from the DRM Program from the
4 third parties about their bids and their dispatching the
5 market and I think that should be --

6 CHAIRMAN WEISENMILLER: Okay, why don't you wrap
7 up? Go, Ralph.

8 MR. CAVANAGH: Yes, so Chair Weisenmiller,
9 President Picker, we've reached the end of the panel. And
10 I believe the schedule now calls for a break until 11:00.

11 I will just point out my personal gratification
12 as the moderator of this panel, that although none of the
13 panelists was prompted in any sense obviously the aura of
14 the Byron Sher Auditorium caused all of them to put
15 emphasis on the environmental performance in general and
16 energy efficiency in particular. I salute them for doing
17 so.

18 And we look forward to the remainder of the
19 panel.

20 PRESIDENT PICKER: Thank you all. And we're
21 going to take a 15 minute break and then start promptly at
22 11:00. (Applause.)

23 (Off the record at 10:46 a.m.)

24 (On the record at 11:08 a.m.)

25 MS. TIERNEY: I'm going to take advantage of this

1 moment when people are taking their desks. I'm Sue
2 Tierney, from Analysis Group and I am so privileged to have
3 a chance to spend this day and learn from what's going on
4 in California. This is a wonderful panel on customer
5 choice and direct access and community aggregation from the
6 supplier point of view.

7 And we have four people, who come from different
8 perspectives in the industry. And we're going to take
9 them, in using Ralph's great suggestion, we're going to
10 take them in order here. The first speaker is Geof
11 Syphers, who is the Chief Executive Officer of Sonoma Clean
12 Energy.

13 MR. SYPHERS: Good morning, and I want to thank
14 the two Commissions and also the morning panel for teeing
15 things up so well. I really appreciate you giving this
16 topic the attention it deserves. I think the rapid growth
17 of community choice is clearly an opportunity to make
18 improvements to California's energy system. It obviously
19 is the shakeup in a way that is one of the reasons why
20 we're here.

21 And I think as many as have hinted at all
22 morning, and in prior conversations people have outright
23 said here, it may be time for the investor owned utilities
24 to begin a gradual and graceful exit from selling retail
25 electric generation. I think there's been a mismatch since

1 decoupling. I think having monopolies in markets that have
2 a significant commodity component has really not served
3 ratepayers well. And so I think we have this opportunity
4 now to think about the bigger picture, about what our
5 future looks like.

6 I want to thank PG&E too for starting a dialogue
7 with Sonoma Clean Power on fundamental market questions.
8 And I expect that we will be able to put forward a distinct
9 proposal on exit fees that's different from the PAM, as the
10 utilities noted in the recent application.

11 Community choice programs access the full breadth
12 of energy providers and have significantly stepped up
13 competition in California. And we actually don't mind that
14 a handful of electric suppliers have grumbled about us. It
15 just means that their margins are getting smaller and the
16 ratepayers are benefiting. And so as I think most of you,
17 we've got well over a billion dollars of construction going
18 on in California with community choice programs now. It's
19 probably nearing about two billion at this point, because
20 of all the new projects that have been going on. Enough
21 that some staff at the ISO have raised concerns that we may
22 be building renewables too fast. So we have some
23 fascinating questions ahead of us about what to do about
24 that. And really where are we now?

25 You know, as we bring competition, we're

1 protecting the public against direct access cherry picking
2 of large commercial customers, we do ensure that all
3 residential and particularly low-income residential have
4 access to the benefits of a competitive market. And that's
5 an important distinction in community choice.

6 We all recognize that California's greenhouse gas
7 goals are no longer primarily dependent on building new
8 renewable sources. And that's a new era. President
9 Picker, you've pointed this out, I think consistently at
10 every presentation I've ever seen you talk at.

11 The new paradigm of fuel shifting, load
12 management, demand response, storage, electrification of
13 transportation, it all recognizes that turning down and
14 turning off fossil sources is the thing that matters, the
15 subtraction-ality of fossil. Addition-ality of renewables
16 is no longer the point. It's still a tool that we have.
17 And I'm not saying we don't want to build renewables. But
18 it's a tool. It's not the goal. And that really calls for
19 a close look, all of those different kinds of activities,
20 at who can deliver the results.

21 So the current paradigm assumes that it's easier
22 to command the big three investor utilities to build
23 infrastructure and implement customer programs, but I would
24 say that's worth reconsidering. Investor owned utilities
25 weighted average cost of capital is a full percentage point

1 higher than public agencies and public utilities.

2 Investor owned utilities have shareholders, who
3 are conflicted about measures that reduce capital
4 investment, for example, by targeting low cost places for
5 electric vehicle charging. And two out of three of the big
6 utilities are directly conflicted about reducing gas sales.
7 And so we need market actors that can step in and fill some
8 of those voids.

9 California really needs community choices
10 programs to run pilots. We can do so very quickly. And
11 one of the things that we're starting to do is create
12 demand response master aggregation agreements in our clean
13 grid standards that allow us to have any number of demand
14 response providers underneath them. And what that does is
15 it protects the customer against poaching and hanging onto
16 customers that don't want to be in programs or want to make
17 switches.

18 Right now, one of the big problems in demand
19 response is some companies have hung on to customers, made
20 it difficult for them to leave the program. And so the
21 public is benefiting by having that kind of oversight.

22 Sonoma Clean Power has got an electric vehicle
23 bulk discount program, as was mentioned. Lancaster Choice
24 Energy has just bought 85 electric buses. These kinds of
25 things are happening, because community choice is

1 responsive to local needs, like MCE's LIFT program, the
2 Low-income Family and Tenants Program. And it's really
3 accessible public oversight that we're really looking for
4 in one of those areas where community choice can help.

5 So how to get the bigger opportunity for
6 community choice I would argue is solving the exit fees.
7 So one of the key topics in front of us is getting the exit
8 fees right. And I think we all can concur that there's
9 some problems with how they're done now.

10 There are four key principles I want to offer now
11 on exit fees. And the first is transparency. Whatever we
12 do, we need to make sure that all the existing contracts
13 that are going to feed into these fees and all the
14 portfolio information about them is auditable by
15 individuals that aren't directly in the market. And that
16 means staff at community choice programs that sign non-
17 disclosures and don't do trading. It needs to be
18 auditable.

19 The second is there is a duty to mitigate costs.
20 What's been put forward so far to the CPUC on the PAM
21 proposal, the Portfolio Allocation Method, implies
22 essentially there's not duty to minimize costs feeding into
23 the fee. And that doesn't make sense. In any sort of
24 breakup the judge would order that both parties have a
25 responsibility. And in this case that responsibility of

1 mitigating costs is clear. There's a need for certainty
2 and in fact that's a need for all parties: ratepayers, the
3 IOUs, the community choice programs. And that can't be
4 achieved with a floating year-by-year process such as the
5 current PCIA, or the proposed PAM. We really need
6 increased certainty, increased ability to forecast, we want
7 to minimize the risk of rate shock.

8 And then finally and maybe most importantly we
9 have to stop double procurement. This is -- is there a
10 slide that you've got up? So I want to point out in the
11 middle of this slide the PCIA was double procurement. The
12 dollars on the left are showing dollars per megawatt hour,
13 over the next several years. And there's a couple of
14 scenarios there.

15 This is just the current PCIA. This is the way
16 things are now. When an investor owned utility hangs on to
17 all the contracts that they no longer need, because a CCA
18 is formed and removed some of the customers, then the
19 electric market becomes doubly exposed to market risk.
20 Because you have two complete entities with two complete
21 portfolios of energy. And in that dashed line, if you
22 exercise all the RPS contract extension options, you can
23 see that the fee is higher, over time. If you don't
24 exercise it, it drops off sooner.

25 If you go to single procurement, that bottom

1 line, where the utilities in 2014 would have taken up to 12
2 months to sell based on the forward price curves at that
3 time, all of the contracts for Sonoma Clean Power in our
4 case, the fee actually would have been massively lower.
5 That represents hundreds of millions of dollars over time,
6 the difference between those two lines.

7 And that was our expectation. When we formed,
8 the expectation was the utilities would dispose of their
9 long contracts. We would be a potential buyer of those
10 contracts, but the market would as well and our customers
11 would cover the difference there. What's disturbing is the
12 proposal that's before the Commission now is called PAM and
13 it's that top line. And that's net of assignment of RECS.

14 And so the real number is actually close to \$60
15 per megawatt hour for 2017 and that's a disturbing kind of
16 number, because every single one of those lines represents
17 indifference. We're not arguing about indifference. We're
18 arguing about behavior. What is the responsibility of each
19 party to minimize costs, to take actions to protect
20 ratepayers.

21 So I think if a utility chooses to double procure
22 generation resources, by holding onto contracts it doesn't
23 need, then the costs and risks of that obviously need to be
24 borne by the utility. And maybe by its shareholders,
25 because that doesn't appear to follow policy at this point.

1 And community choice programs do have a legal obligation to
2 buy for our customers.

3 There's too much energy procured in California.
4 And as more CCAs emerge, if this practice continues we're
5 going to have even more and more energy procured. And I
6 think the argument for this, at least what I heard
7 informally, is that the utilities need to be there in case
8 the CCA fails. And I would argue that's just a flat wrong
9 assumption. We don't do that for any other aspect of the
10 electricity market and the power sources that community
11 choice programs have don't disappear if the CCA fails.
12 They continue to produce. Their owners actually continue
13 to sell into the market.

14 So it's my belief that competition is best served
15 when a responsible public agency oversees the bidding and
16 the provision of electricity by a broadly diverse market of
17 electric suppliers. And that's exactly what community
18 choice does. So I look forward to resolving the exit fee
19 issues, so we can unlock the potential of CCA further.
20 Thank you.

21 MS. TIERNEY: You set a high bar, Geof. You got
22 in on the wire. That was great.

23 And Ann Hoskins is the Chief Policy Officer of
24 SunRun.

25 MS. HOSKINS: Thank you, Sue, and thank you very

1 much President Picker and Chair Weisenmiller and all the
2 Commissioners. It's a real pleasure to be here. I just
3 want to touch on a couple of quick points and then hope we
4 can get into some discussion.

5 One question really is why am I on this panel?
6 SunRun asked ourselves that, because we're not a direct
7 access provider. And we're really different than a CCA.
8 Our customers are generators. And they're consumers. And
9 in our view, they're providing really significant services
10 to the Grid. And there's opportunities. We're so excited
11 because we're on the cusp now of them being able to provide
12 much greater opportunities to some of the challenges that
13 the state is facing.

14 President Picker, you asked a really interesting
15 question about the two-hour solar eclipse. And the first
16 thing that came to my mind is, "Wow, it's really too bad
17 that solar plus storage is really just rolling out now."
18 Because our solar plus storage, our BrightBox offering, if
19 that were in place across the state in a much broader way,
20 people would be able to charge the night before and would
21 be able to cover that two-hour period. We have that
22 technology.

23 And the message I'd most like to leave with you
24 today is that we're still going through a lot of regulatory
25 transformation with distributed solar. There were some

1 comments earlier that I'll address about that, but I don't
2 think this is the time to add another level of regulatory
3 uncertainty on distributed solar. Particularly as we're
4 working to try to combine it with storage and become an
5 offerer of grid services.

6 Right now, as you are well aware, we're right in
7 the middle of really implementing NEM 2.0. It put into
8 place a fairly complicated system, where our customers are
9 now slowly over -- as different utility rate cases are
10 being completed -- are facing different types of time of
11 use rates. And we have a really important obligation to
12 make sure that our customers understand that. That our
13 sales people understand it and that we're able to provide a
14 product that will provide value to customers.

15 And so our understanding going into this, is we
16 have a little bit more time before we're going to think
17 about the next level of reform on that. And I would just
18 ask you to think about that as I understand you're trying
19 to look at the big picture here. And at one level that's
20 really important. But at the same time, I think we heard
21 from the representative from Jackson Winery, just how
22 important it is to have some certainty. And it's certainly
23 one of the key principles of regulation right, is to try to
24 have some level of certainty for customers and also for
25 providers.

1 So that's one of the messages I just wanted to
2 share with you is that we do have some concern about having
3 another proceeding. We obviously are involved in the rate
4 cases that are setting the TOU rates. We're involved in
5 the distribution planning proceedings, which are critically
6 important I think for understanding where our services are
7 being provided. As well as where there's the greatest
8 benefit of distributed generation. And I think adding
9 another one on top of it for us may be hard for us to
10 participate in the productive way that we would otherwise
11 want to.

12 A couple of things I just want to touch on,
13 almost in response or just to, I guess step back. Because
14 I take it as a given that distributed solar is really
15 consistent of the policies of California. And just as a
16 step back I myself just out here in September. I served on
17 the Maryland Public Service Commission and we always looked
18 to California as a real leader. And California is the
19 leader and in fact so much so, that that's how the
20 distributed solar industry grew.

21 We have over, I think about half, close to at
22 least half of our customers are in California. And so this
23 is an incredibly important state in setting solar policy
24 and in setting policies that supports a reduction of
25 greenhouse gases. And we view our customers as on the

1 front lines of that. Our customers tend to be very mission
2 driven, as do our employees. And we want to continue to
3 help support that and to work with the Commission and other
4 stakeholders to try to do it as efficiently and as
5 effectively as possible.

6 And as I mentioned, the really exciting
7 development is now we're starting to have the opportunity
8 to do solar plus storage. For us, it started in Hawaii and
9 we've sold over 1,000 storage units. And now we're
10 offering, in California, we've applied under the SGIP
11 Program, so we're participating in that. We're trying to
12 participate in demand response. We see ourselves as this
13 technology rolls out as being part of the solution for that
14 more reliable grid to be able to eventually hopefully bid
15 into CAISO. So we're trying to participate there as well.

16 That this is something now that it's not just the
17 issue of our customers' self generating, which we think is
18 valuable, because they're not polluting and their reducing
19 load. But also offering something back to the Grid.

20 And one of the issues that is a concern to us is
21 that while we fully understand the need for grid
22 modernization -- I certainly do having been a formal
23 regulator in the importance of reliability. We do have a
24 concern of some of the proposals that utilities are putting
25 forth right now, of such great magnitude, billions of

1 dollars for grid modernization when we feel like, "Wait a
2 second. We have this technology and we think with this
3 technology we will be able to be part of that solution."

4 And there's a really interesting study that
5 Berkeley Labs, LBNL, put out in January, and if you haven't
6 seen it I hope you will look at it, which tries to put this
7 in context. Because believe me I love California, because
8 California likes solar and we know we're welcome here.
9 There are some states where it's much more -- where we'd
10 have a more difficult time.

11 And I think the issue here though is when we go
12 out to some of these other states and we hear about oh,
13 there's all these subsidies that are thrown around or cross
14 utilization. LBNL puts it in context, even if you had 10
15 percent penetration of distributed solar, it is miniscule
16 the impact on the rates as what we are going to be facing
17 with the huge grid modernization proposals that are coming
18 out of across the country.

19 And so what I think is we have an opportunity
20 right now with this technology as long as the Commission
21 gives us a little more runway, as was initially planned I
22 think with NEM 2.0, to continue to have solar be
23 accessible, expand accessibility to more folks, and also be
24 there as the anchor to support grid services.

25 And finally, I just wanted to touch on one of the

1 issues that the Environmental Justice representative
2 raised, because I think that's also really critical. And
3 it's something that I personally, and the company is very
4 committed to try to find a way to expand access to all
5 renewables but certainly to distributed energy.

6 And we had been working, recently entered an
7 arrangement with GRID Alternatives trying to make use of
8 some of the SASH funds that the California has put forward.
9 Trying to find ways that we can work with other
10 organizations both developing affordable, distributed
11 solar. Also in hiring from more diverse communities
12 through groups like the Greenling Institute trying to find
13 ways that we really can expand access.

14 And one of the things I would ask you think about
15 as we consider additional potential charges that could come
16 out of these proceedings, is that those charges make it
17 less accessible.

18 And I think that somebody mentioned earlier Mr.
19 Sherman Upercomm, (phonetic) who I think was one of my
20 teachers back in college. And you know, I mean think about
21 the economics of this, you know when we keep putting all
22 these assessments on the user, on the use, it does affect
23 behavior. And it affects the economics of how this works.
24 And that is really the challenge of making this accessible.
25 And I think the opportunity to have funds like SASH like

1 some of the other incentives, figuring out ways to help us,
2 so that we can raise the capital to provide leases on more
3 affordably with groups like GRID Alternatives, we have to
4 keep in mind that this needs to have a value proposition
5 for the customer.

6 So that I just want to again thank you for your
7 time. I really want to look forward to talking with you.
8 As I said, I'm not sure that distributed solar really
9 belongs here, but I fully appreciate the opportunity to
10 speak with you today. Thanks.

11 MS. TIERNEY: Thank you, Anne.

12 Our next speaker is Ron Perry, from Commercial
13 Energy, where he is the CEO.

14 MR. PERRY: Thank you, President Picker and
15 Commissioners for allowing employee-owned Commercial Energy
16 to represent direct access providers in the state. As an
17 active participant in natural gas and power markets in
18 California for the last decade, and celebrating our 20th
19 anniversary this month, we have three goals today.

20 First, describe the unique competitive advantages
21 of direct access providers versus compared to utilities and
22 CCAs. Second, apply the lessons learned from natural gas
23 direct access over the last dozen years in California to
24 the power market. And third, suggest regulatory and
25 legislative changes to help decarbonize, diversify and

1 directly serve customers.

2 First, what are the unique advantages of ESPs?
3 Well, ESPs are at the heart of entrepreneurship. We exist
4 to identify inefficiencies in the market and develop
5 products or services to fulfill that unmet need or lower
6 the cost of a known one. My team has a relentless focus on
7 bringing innovation and market transparency to over 3,000
8 current clients in California.

9 Here's how a direct access supplier works.
10 Today, think of us not as energy supplier companies, but
11 service companies, managing supply, demand and delivery
12 costs of a business. At commercial, we see our role as
13 educators first and solution sales second. We teach our
14 clients what causes volatility in the markets, educate them
15 on the long-term cost drivers and how wholesale prices,
16 compare to the utility tariff.

17 To execute our sales, we have to find each and
18 every customer. We don't get an opt-out option. This is a
19 meticulous, costly process. We analyze usage at a 15-
20 minute level with our insight tools. That's why we love
21 time of use pricing. It brings the same price signals to
22 customers that we have seen in buying wholesale power since
23 1998.

24 Our energy strategy can be as simple as a supply
25 contract for a couple of years with a hedging increment to

1 it, right? But we earn loyalty by showing our customers
2 how we perform to meet their goals.

3 We apply our CE 360 view of supply, demand and
4 delivery to cost to identify next solutions. Our workforce
5 development employs local contractors to execute behind the
6 meter projects, which deliver decarbonization. From
7 battery storage and solar roofs we've done HVAC and
8 hundreds of lighting retrofits to fueling stations and
9 onsite co-generation projects. At its best, this is an
10 intimate relationship with the client, not transactional.

11 We must offer this full range of services,
12 because we're in a brutally competitive market. To earn an
13 electricity customer, we typically split the available
14 gross profit from the wholesale market with the client.
15 This means that a DA-served business can see all in savings
16 of 10 percent, currently, below the utility costs including
17 the PCIA. Compared to the 1 percent savings of CCAs the
18 competitive market puts much more of the savings in the
19 client's pocketbook.

20 The utility model is more of a command and
21 control vision of a planned economy. Quoting from your
22 comments at the last en banc, centralized planning is
23 critical to ensure that GHG reduction strategies are
24 harmonized and resource investments are made efficiently.
25 But this, pardon the expression, Soviet style central

1 planning must be balanced by the Commissions' goals for
2 diversification and innovation.

3 I'll borrow a line from Amory Lovins when he was
4 once told that his thoughts were "outside the box." He
5 said, "There is no box."

6 The problem is the utility box is enormous. And
7 the utilities seem to agree. At the last en banc they
8 asked this Commission to consider pausing, "all procurement
9 mandates not tied to reliability until the Commission can
10 ensure that bundled customers are financially indifferent
11 to the departing load, because the joint utilities
12 portfolios are well positioned to achieve their 50 percent
13 standard. And a temporary suspension will not interfere
14 with this progress."

15 These assets distort the market in the long run
16 as seen in the debate over the PAM charges. If these
17 centrally-driven investments were still efficient, the PCIA
18 would be negligible. Prudent portfolio management is about
19 diversification. Just as you would not invest all your
20 money in bonds at a low interest rate, you diversify with
21 stocks, real estate, cash to protect your downside.

22 The utilities' LTTP acts like bonds, so when the
23 market moves they get devalued. To the extent that DAs and
24 CCAs are allowed to be in this marketplace in the short
25 term, instead of being compelled to build long term, we

1 provide the space in the marketplace for innovation and
2 proper market signals.

3 On the other hand, CCA providers, they claim to
4 be closer to their members by virtue of their local Board
5 of Directors. But those members are cities whose first
6 duty is to their own citizens, not the collective of the
7 CCA. These cities can return the utility service on one
8 year's notice and the customers can return under the same
9 rules as an ESP any time they want. So there's no
10 guarantee of continued loyalty to help fund their long-term
11 investment plans. They are succeeding today because they
12 have one competitor, a regulated utility that is priced
13 well above the current market.

14 Because the market yields a 30 percent gross
15 margin, to the CCA and the ESP, making guarantee savings of
16 1 to 2 percent of the posted price and keep the difference
17 of 10 to 20 percent to fund their coffers. Because ESPs
18 function in a more competitive market we cannot keep that
19 kind of gross margin. We have to return it to our
20 customers. But we do agree with Don Weiss of Marin Clean,
21 (phonetic) at the last en banc and Geof, choice is good.

22 So, what lessons did we learn from natural gas?
23 Unlike electricity all natural gas consumers in California
24 have the choice of supplier and have had that right since
25 before the energy crisis. As a result, the CTA market

1 share in PG&E's core supply peaked at about 50 percent of
2 small and medium businesses and 25 percent of total core
3 supply. We think that's an upper bound of the potential
4 market penetration in a fully open direct access market
5 once you have accurate indifference calculations.

6 What works in natural gas has been this: one,
7 transparent price comparisons to the utility. Two, gas
8 storage assets are owned by independent energy producers
9 most effectively, not utilities. I can point at Aliso
10 Canyon and McDonald Island to prove that. Three, third-
11 party owned generation is essential. We have not needed
12 any utility-owned natural gas production to serve the core
13 in the past decade. It's all imported, 90 percent. And
14 finally four, transparent pass-through of stranded costs
15 works in gas, as it has on our interstate gas transmission
16 and storage.

17 These assets are similar to the capacity and
18 supply costs embedded in the PCIA. But unlike the PCIA
19 assets, CTAs get the option to use the assets we are paying
20 for. We do not get that option under the current formulas.
21 Applied to electricity, these assets would count towards
22 our procurement and our RA responsibilities and be assigned
23 to us to meet our load obligations.

24 Finally, what are our recommended regulatory and
25 legislative changes? At the last month I've had Mike Day

1 of Goodin MacBride review the current legislation for CCAs.
2 We believe you do not need new legislation to allow direct
3 access to serve business customers immediately.

4 We have the brief here. The legislation enabling
5 CCAs specifically permitted direct access with two specific
6 restrictions. First, we can only sell to businesses inside
7 a new CCA territory, not outside it. So the joint
8 utilities can rest assured ESPs won't be everywhere, just
9 in the footprint of the CCAs that are running today.

10 Second, the ESPs have to sell to the CCA, who then sells to
11 the business customer, at the contract price that was
12 agreed to. This will involve a process of scheduling and
13 balancing between active ESPs, their clients and the
14 relevant CCAs. That process will require written
15 procedures to ensure fairness between all parties.

16 We're happy to work cooperatively with the CCAs
17 to implement the statutory requirement. The CPUC should be
18 the arbiter if this cannot be done amicably before the end
19 of this year.

20 With direct access available inside CCA areas,
21 the urgency to get legislative change to expand or
22 eliminate the cap is diminished. If the political will
23 exists today, we could take direct access further, once we
24 agree on the indifference methodology. And we would
25 support graduated increases to the cap, over a ten-year

1 period.

2 Finally, we must increase transparency for the
3 consumer. The joint utilities actually noted that that
4 portfolio transparency is important for comparisons between
5 CCAs higher renewable options and joint utility's green
6 tariff program.

7 The CPUC's recently completed design thinking
8 study highlighted that customers prefer a limited selection
9 of options that provide them with choice and the ability to
10 choose. But if customers can't see the future price, they
11 can't make an informed choice.

12 We recommend that the utilities and the CCAs show
13 their average forward price and the imbedded volatility of
14 that price over a five-year time horizon. This allows
15 customers to make five-year business decisions, rather than
16 the critiqued one to two year that direct access has
17 historically been. It's because we can only see one to two
18 years.

19 Finally, the same process should be used to
20 forecast in different costs of both utilities.

21 I'm good, all right?

22 MS. TIERNEY: (Indiscernible) go.

23 MR. PERRY: In summary, and I'm right there. I
24 get to breath now. In summary, we recommend the CPUC
25 accept the joint utilities' offer to suspend further LTPP.

1 By the end of the year, The CPUC should enforce, if
2 necessary, the current law and allow DAs to sell through
3 CCAs. And we should have transparency of stranded costs,
4 transparency of supply portfolio costs going forward.

5 Thank you very much for your time and the
6 opportunity to be here.

7 MS. TIERNEY: Thank you, Ron.

8 We have another Jeff on the panel today, Jeff
9 Cramer, who is the Executive Director of the Coalition for
10 Community Solar Access.

11 MR. CRAMER: Great, thank you very much. And
12 thanks to both Commissions for having us here and letting
13 us share our perspective.

14 (Brief pause to set up talk.)

15 Okay. So I'm here to offer a perspective on how
16 community solar is growing throughout the country. CCSA is
17 a national trade association for the community solar
18 sector. And we represent over 30 businesses, professional
19 services, solar providers, customers in the community solar
20 space. Our mission is simple. And it's to expand access
21 to solar to all customers. Any customer with a bill should
22 have access to solar, so I'll continue banging the drum to
23 expand choice for customers in California as well.

24 We are not active currently in California as
25 community solar as I'll discuss, in other states doesn't

1 really exist or isn't moving or active here. But I may
2 have some recommendations that could be helpful to you,
3 that could work within existing statute and possibly some
4 recommendations that would require changes to statutes.

5 So just to start I'll say what probably everyone
6 knows and that is that customers want solar. I think
7 that's one of the reasons we've seen a lot of discussion
8 here today on the expansion of solar. It's because
9 customers want it. And a number of studies in the last
10 couple of years have proven that customers across customer
11 types from corporate customers, small commercial customers,
12 residential customers, want access to solar.

13 Unfortunately, not all customers have access to
14 it. According to our estimates, which work with a number
15 of studies in this space, show that roughly 85 percent of
16 customers today do not have access to solar. This is a
17 GTM, Greentech Media graphic, that demonstrates a
18 perspective for 120 million U.S. households in the country.
19 And as you can see, as you go down the curve here, there
20 are a number of limiting factors that don't allow all
21 customers to have access to solar.

22 Well, the 85 percent number is probably not
23 correct for California. We would estimate that at least
24 half, the majority of customers in California, don't have
25 access to solar. And as we heard in earlier presentations

1 about 6 percent, I understand of all distributed
2 generation, is owned and operated by low to moderate-income
3 communities here in California.

4 Community solar is growing across the country.
5 As you can see from this graph, the number of projects
6 being developed in the third-party led are growing rapidly.
7 This year, next year and beyond, most of that growth is
8 happening in the northeast, Massachusetts, New York.

9 Thank you former Commissioner Hoskins for opening
10 up the market in Maryland. I'll talk a little bit more
11 that. As well as in Colorado, Minnesota and some other
12 emerging markets.

13 Just to give you a quick overview of how these
14 programs are working in Massachusetts, we have about 60
15 megawatts of operational community solar. That's likely to
16 grow to about 200 megawatts in early 2018. That program is
17 driven by virtual net metering. And that's actually moving
18 to a declining block incentive program, starting at the end
19 of this year.

20 New York, that market has just opened. They have
21 taken a value stack approach, which creates a credit that
22 resembles retail rate. A market transition credit is also
23 in a declining block program where it offers proxy value
24 for distribution system benefits and environmental benefits
25 to create positive economics for project development there.

1 In Maryland, we'll likely see up to about a 200,
2 192 megawatt pilot program in 2019. That's a program that
3 was designed to reach about 1.5 percent of 2015 peak load.
4 The one lesson learned, I think, from Maryland, that could
5 be interesting for California is -- and obviously, I'd love
6 your take further -- but there was a policy goal to expand
7 access.

8 And there could be significant debate around how
9 do we assign a value to these community solar projects?
10 And they decided that's a discussion worth having, but
11 first our goal is to expand that access. So we know what
12 works and compensation at the full retail rate, at least to
13 move the market much like onsite has received for gigawatts
14 of on-site solar, here in California, has received retail
15 compensation. And that will drive the market, that will
16 create standard contracts, expand access, right? So that's
17 one method of phased approach to deploying megawatts into
18 the ground, right? And expanding access through community
19 solar.

20 Illinois, actually yesterday there was a big
21 meeting in Illinois to discuss implementation of their
22 program, which was based on 2016 legislation. They also
23 have a credit, that's based on a value stack for the energy
24 credit. A DG rebate and then an adjustable block program.
25 We're expecting about 200 to 300 megawatts by 2020, in

1 Illinois.

2 In Minnesota, we are expecting about up to 400
3 megawatts by the end of this year. The compensation for a
4 generation there is based on the retail rate. And the
5 second phase of the program is moving towards a value of
6 solar tariff.

7 Colorado was largely the first market in the
8 country to expand access to community solar. It also works
9 in a retail rate environment, although the credits are
10 calculated user-by-user. There's also a 5 percent low
11 income carve-out. Many lessons learned in how to deploy
12 solar to low-to-moderate income communities have been
13 established in Colorado. They started with a project-by-
14 project carve-out and now have moved to a standalone
15 program that has seen some successes.

16 And then lastly, there are voluntary projects. I
17 believe a little bit over 100 megawatts in the country
18 where utilities are deploying community solar projects on
19 their own in 25 states across the country, some of which
20 have very high subscription rates, some of which have lower
21 subscription rates. Typically, the ones with higher
22 subscription rates offer an economic benefit to the
23 customer.

24 Finally, there are a number of markets across the
25 country that are opening, and I've listed them there and

1 they're in the implementation phase.

2 CCSA operates, based on a set of core principles
3 that we believe all programs should be designed around.

4 In addition to those core principles, we've put
5 out a policy decision matrix for Commissions, Legislatures
6 around the country to show how to best design programs that
7 actually expand access to customers. This is just a brief
8 example of how we created the matrix, asking key questions
9 they have to think about. And then offering
10 recommendations.

11 Obviously, I'm not going to go through all of
12 these here, but these offer a good insight into how you can
13 design one mechanism of a program that will affect another.
14 Whereas in California perhaps you want larger projects, I'm
15 just speaking off the cuff. And then you can have a lower
16 credit, or vice versa in some markets. So this is an
17 example of all the standard features we think are key to
18 designing a successful community solar program.

19 In California, I think a lot of these facts are
20 quite obvious. In your white paper you noted that 85
21 percent of customers may go out, be purchasing generation
22 from outside their IOUs in the 2020s. And we believe
23 community solar should be one of those options. As it
24 currently isn't now, and there are a number of benefits
25 that fit with California's energy policy goals. It's

1 clean, greenhouse gas reduction. It's local. It enhances
2 the distribution system, especially when paired with
3 storage. It involves customer financing of greenhouse
4 goals. It's scalable. Obviously increases access and has
5 co-benefits like job creation, community development. And
6 it's also flexible. It can work across models from IOUs,
7 third parties, to even CCAs.

8 Today, in California the ECR program --
9 unfortunately the economics don't really work for community
10 solar at this point, especially when coupled with
11 administrative requirements like 60-day customer
12 acquisition of at least, I believe, it's one-sixth of the
13 total project size, the securities laws, the preapproval of
14 marketing materials and unsubscribed energy treatment.

15 So as we go forward in California -- this is my
16 last slide -- I'll say that we have some basic
17 recommendations. And that is you need to start with clear
18 policy guidance. If the policy guidance is we want to
19 expand access to solar to everyone who has an electric bill
20 there needs to be a program that can insure that megawatts
21 are driven into the ground. And perhaps that's done
22 through a phased program, right? Or perhaps it's done by
23 changing the existing program at a larger scale. There
24 needs to be a dedicated program to reach LMI customers.

25 And most importantly, you just need to make sure

1 that these clear policy goals then translate into an
2 economic value proposition that works for customers, access
3 to all consumer classes. And direct ties to specific
4 projects that include competition, consumer protection, and
5 community engagement. That's all I have.

6 MS. TIERNEY: Thank you.

7 Mr. President, Mr. Chairman, Commissioners, you
8 heard from four very different market segments. And I'd
9 like to give you guys the opportunity to start because
10 we're all very interested in what's on your mind.

11 PRESIDENT PICKER: We'll, I'm going to call on
12 Commissioner Randolph, who really get a chance to ask her
13 questions in the last session, but she says that her
14 question is equally relevant here.

15 COMMISSIONER RANDOLPH: Exactly.

16 So in both panels there's been discussion about
17 sending market signals through rate design. And so one of
18 the practical questions that I have in this space is as you
19 have more providers then you end up with even more entities
20 setting rates. And so how do we address rate design and
21 sending the right signals and not having -- you will have
22 solar customers that are CCA customers, or IOU customers.
23 And customers in the same territory are going to have
24 different rates.

25 And when you're talking about trying to come up

1 with some of the creative rate designs that Nora talked
2 about, and the gentleman from Jackson Family Wineries
3 talked about, how are you encouraging the development of
4 those in a consistent way?

5 MS. TIERNEY: Geof?

6 MR. SYPHERS: I'll start and I'm sure there's
7 others who will jump in. One thing to note is that as a
8 practical matter, community choice programs don't currently
9 have the option to have different rate structures. We
10 legally do, but as a practical matter, the billing systems
11 of the utilities won't provide us the data to do billing
12 for 60 days if we want to have a different rate structure,
13 different hours or time of use periods or that sort of
14 thing. So that's a functional problem right now.

15 So as a practical matter all of our rates have
16 the same design as the investor owned utilities. They may
17 have different values for the generation charge and they
18 do. So that's one thing to note.

19 And the other is I would encourage the Commission
20 given the comments, and I think it's correct, that
21 regulatory process lags real market movement. And the
22 realities of the evening spike and the duck curve aren't
23 really reflected in current time of use rates yet. I would
24 encourage the Commission to think about creating pilot
25 rates that smaller implementation can test out while the

1 Commission is taking the time to the general three-year
2 cycles and get the updates to time of use rates.

3 I think this is something we've heard interest
4 from direct access, we've heard interest from CCAs. I
5 think the solar community will be interested, particularly
6 if they're optional. I think optional rates are going to
7 be very popular with customers as well. And I think that
8 could do things to resolve, for example, the mid-day
9 negative price spike. We're trying to put electric car
10 charging in downtown location, but we can't yet, because
11 nobody wants to actually charge their car when delivery
12 rates are high. Even if our generation rate was zero, we
13 would be charging far more than the actual cost of
14 electricity, during much of the year, because we see so
15 much negative pricing in the middle of the day.

16 What if we could encourage electrification of
17 transportation by having a pilot that had essentially no or
18 very little even delivery charge in the middle of the day.
19 And we actually ran that for a number of years and had a
20 commitment to that. We could try that at a small scale,
21 like at a CCA and then scale it up to the state if it
22 works.

23 And so that concept, that's just an example. But
24 as a concept, I think the idea of having pilots that can
25 test out good ideas quickly --

1 PRESIDENT PICKER: Just I'm going to interject a
2 point of information. AB 327 actually limits the range of
3 pilots that the PUC can allow the utilities to default
4 people to. And so while the utilities will be proposing,
5 and we will probably be deciding a number of default tests,
6 we cannot deem or require anything beyond simple time of
7 use. So time variant programs could possibly be approached
8 by opt-in programs and particularly through those default
9 programs, because then the utilities have the option to
10 offer people true choice.

11 But I will say it's not even just regulatory
12 drag, it's the challenge of multiple decision making
13 processes that are much slower than the pace of change.

14 MR. SYPHERS: Yeah, and voluntary is good with
15 me.

16 MS. HOSKINS: I'll just add that another one of
17 the many benefits distributed solar is going to bring to
18 California is that we are testing a lot of this out, right?
19 I mean, where our customers are going through it right now.

20 And I think that one of the themes I tried to
21 share earlier was that we do need to always the balance the
22 complexity of the rate design with the simplicity, so that
23 we can make sure customers understand the value
24 propositions that they're having. But at the same time, I
25 think that's one of the benefits of having competitive

1 markets whether it's in energy or in telecom, is that part
2 of our job is to figure out how to communicate with our
3 customers and to spend the time with the customers and help
4 them understand the value proposition. But I would say
5 that there's opportunity and I would say that the solar
6 industry would be very happy to try to share the lessons
7 learned in a way, right? As you're looking towards the
8 time when you'll be facing this into a much broad range of
9 customers of how it's worked and where there may have been
10 more confusion or the like.

11 But so far we think it is working. We think it
12 is valuable in terms of having the ability to give a price
13 signal to move the resource to one that's more valuable.
14 So I'm sure people were a little scared about it a few
15 years back before I was here and discussed it, but I can
16 tell you that we're embracing it. And are happy to work
17 with the Commission as we start get lessons and feedback
18 from all of our customers and sales people.

19 PRESIDENT PICKER: And so the real impact the
20 time of use rate for solar self generation is actually to
21 move to more generation to the west side of the west-facing
22 roofs.

23 COMMISSIONER PETERMAN: May I ask a follow up
24 question? So two questions, and Mr. Perry, I'd like you to
25 respond to both.

1 So the first relates to transportation
2 electrification. The investor owned utilities and the CCAs
3 have both expressed a willingness, and an interest in
4 supporting transportation electrification through both
5 charging and some support for vehicles. So I wondered if
6 you could share what you see as the ESP role in that space.

7 And then second, I'm broadly interested in your
8 thoughts about the relationship between ESPs and CCAs.
9 I've heard you articulate both a cooperative model where
10 you're the supplier to the CCA. And then I can envision a
11 competitive model where you're both targeting the same
12 customers.

13 And I'd like Mr. Syphers to also respond to that
14 second question.

15 MR. PERRY: Thank you, first on VTG, on Vehicle
16 To Grid, that's one of those ways where I believe direct
17 access really can bring a solution to the marketplace.
18 Because of our tighter relationship with business clients,
19 I can go to a building owner, commercial office space, now
20 and say, "Let's put in plugs."

21 We started our business in Montana. You know
22 what's standard in Montana? You plug your car in at night,
23 in the winter, to keep the engine warm. Everyone has a
24 plug. We don't do that in California, because we don't
25 need to, but it's not that cost prohibitive. And if we had

1 the ability, maybe we'd have a way to pull energy into
2 those cars at noon, as Jeff was talking about, as well as a
3 pilot program.

4 The difference is with a DA provider, at least in
5 our business, we don't look at anything as a pilot. We
6 don't roll something out to the market place until it's
7 completed. And so I think we can touch the customer
8 quicker. He can help his employees easier. And I think
9 that gets us a little bit tighter.

10 I don't have any specific recommendations on it,
11 per se. Obviously battery storage fits in with this very
12 well. And now you're talking about a customer with battery
13 storage and he can dump load into that and pull load down.
14 And part of that goes to the -- you have a proceeding right
15 now, that was filed up at Lourie (phonetic) two weeks ago,
16 that talked about the idea that you get wholesale input if
17 you pull power at the peak hours, or excuse me, the excess
18 generation hours. And there is no transmission or TND
19 costs to bring it in. That's an interesting idea. It's
20 tricky, right? The metering part of that gets a little
21 odd.

22 So I'd like to have a deeper answer. I think
23 Commissioner Wellinghoff will talk to this deeply this
24 afternoon.

25 On the second question of competition versus

1 cooperation with the CCAs, let's take the word target out
2 of customers. And yes, we're a competitor. We have to be.
3 That's the only reason we survive for 20 years was we
4 compete for customers by adding value, doing more than just
5 a commodity price savings versus anybody, our competitors
6 or the utility, right? So on that level, we need to show
7 up and see if we can serve a customer better.

8 I believe that while CCAs as startups have done
9 pretty well to get going at the end of the day, they are
10 startup businesses that use public capital in some cases to
11 get initial funding and get going. And that's capital's in
12 the form of mayors and cities and so forth. Private
13 companies, publicly traded companies, we have to put actual
14 capital in and go to market. And so you have to have a
15 fully built business plan and that makes us maybe a little
16 more, I don't want to say disciplined, but we have to be
17 tougher.

18 And so that'll be interesting, but I do believe
19 that that'll be good for the client. If the client values
20 community choice more than a hedged price that maximizes
21 his savings, or that like from us he can get a time of use
22 price based on wholesale market prices. We've done that
23 since 1998. We've sold power on the hourly and balance
24 market pricing to clients, including hospitals, right? And
25 it's worked wonderfully well.

1 If other side, on the cooperation side, is really
2 one of no different than the utilities have to cooperate
3 with us for scheduling and balancing and billing services,
4 right? There are administerial things that we have to do
5 together. We have to be treated fair when we go through
6 that process. And we have to walk through that.

7 MR. SYPHERS: Well, thank you. I want to draw a
8 distinction in my comments, which were critical about DA
9 between existing direct access and new direct access. And
10 I see a clear distinction there.

11 I think my concern is about the expansion new
12 direct access, because the impact on ratepayers, in a sense
13 taking away larger, more lucrative customers, which we
14 don't like to admit. But the reality is large industrial
15 and commercial customers pay more per unit, in effect of
16 the real costs, than residential and low income.

17 And so I think one of the things to point out is
18 direct access definitely does business in CCA territory
19 now. They're going to continue doing business. We buy
20 from many of the same providers who serve direct access.
21 In fact, I think we have nine of them now in our portfolio.
22 And one of the key important things to note is that our
23 regions have broadly elected to have policies that govern
24 greenhouse gas, renewables, local investment, programs,
25 special programs for low-income folks, ratepayer

1 protections that aren't stipulated by the state.

2 And those do cost money. Those are things that
3 we have decided to invest in. We've decided to buy much
4 more long-term contracts than is required even under SB
5 350. We've hedged out with a massive amount of baseload
6 renewables, because we feel like that's going to be a huge
7 defense against the duck curve. And none of that's
8 required, but all of it has a cost. And yet we felt that
9 that was an investment that was in the social benefit of
10 the State of California, and particularly our region to
11 make.

12 So the hard part is if we invite in a competitor
13 that doesn't follow the public policies that we've adopted,
14 or doesn't have to, it's not a criticism. It's just an
15 acknowledgement that that is a very unequal type of
16 competition. And so my fear is, is that leads to costs
17 going up for low-income folks in small business.

18 And I think that's a hard problem to solve,
19 because having another exit fee that flows to CCAs is not
20 something I would really recommend at this point. We have
21 a complicated enough system as it is. So I think that's
22 where I would leave it.

23 COMMISSIONER PETERMAN: Thank you. And I'll just
24 add the reason I wanted to ask that question, I think a
25 challenge for us is distinguishing between the implications

1 for different types of service. And there are some
2 differences between ESPs and CCAs and distributed solar, so
3 I'm trying to get my head around what rules apply to
4 everyone and what would be distinct. So thank you for
5 that.

6 CHAIRMAN WEISENMILLER: Yes, I had a follow up
7 just on the question, taking Carla's to the next step.
8 Which was how similar are the -- obviously we're in the
9 process of coming up with the IRP process for the driving
10 utility investments. What's your process at the local
11 level for deciding between renewables, energy efficiency,
12 electrification of transportation, community solar or
13 whatever? I mean again, how similar of those or dissimilar
14 to where the PUC is going?

15 MR. SYPHERS: So we have a distinct process. We
16 do our own load forecast, using our own methodology. We
17 take very seriously that the market has been flipped upside
18 down as we look out the next ten years. And as we look out
19 the next ten years, it's no longer a dispatch, supply and
20 forecast load. Now, it's really heading in the reverse
21 direction where you're forecasting supply and dispatching
22 load. And we've built our own models and tools to do that.
23 So we actually do our Monte Carlo simulations and we figure
24 out where we need to be. And we go to the market.

25 One thing that isn't widely known is CCAs have

1 evolved just in the last three years where we were getting
2 one to six bids on a typical solicitation. Now we're
3 getting 20 to 40. That's a robust market. We're actually
4 getting really good kinds of diverse offers, but those
5 decisions are made within the context.

6 And this is an important point. The CPUC has
7 full jurisdiction to determine whether or not we've met the
8 state mandates for renewable energy, the storage mandate
9 for the length of contracts under Senate Bill 350. What
10 the CPUC doesn't have with CCAs is the ability to tell us
11 how to meet the mandate. That's under the jurisdiction of
12 the local governing board.

13 So I want to draw that distinction, because
14 there's some question about whether or not the CPUC
15 actually has the ability to enforce state law. And it's my
16 interpretation that you absolutely do. That the CPUC can
17 absolutely sanction a CCA if you have violated the RPS or
18 don't have enough resource adequacy or those sorts of
19 things. So I think that distinction is important.

20 It's not about whether or not we meet those
21 standards. It's about how. And so the IRP process is
22 locally driven at this point. We do submit IRP to the
23 CPUC, but at this point they certify rather than approve.

24 CHAIRMAN WEISENMILLER: But how GHG-centric is
25 your process?

1 MR. SYPHERS: In fact, it's primary, so RPS is
2 tertiary in fact. Fuel shifting is secondary. So first,
3 its greenhouse gas reductions; second, it's fuel shifting;
4 and third it's RPS. Because we see that as a tool not a
5 primary goal, so it is the central element.

6 CHAIRMAN WEISENMILLER: How much steel in the
7 ground is coming out of your process?

8 MR. SYPHERS: How much what?

9 CHAIRMAN WEISENMILLER: How much steel in the
10 ground?

11 MR. SYPHERS: So we have right now about \$600
12 million in construction going on now, through our agency.
13 And that coincides with a little over \$1 billion of
14 contracts. So and that's significant, compared to our
15 territory. And in fact most of the new contracts that are
16 getting signed, as I think you can appreciate, are being
17 signed by community choice programs in California, not by
18 IOUs, because of the forward look where they're over-
19 procured so heavily.

20 PRESIDENT PICKER: Yeah, they did a good job.

21 CHAIRMAN WEISENMILLER: Well, we helped them get
22 there. How much have you --

23 MR. SYPHERS: Maybe too much good a job.

24 CHAIRMAN WEISENMILLER: Have you looked at the
25 CSAs, community solar?

1 MR. SYPHERS: Yes, so we've done a lot of
2 research over the last six years on community solar. We've
3 been working really hard to make the RES-BCT work for
4 community choice, which is a type of municipal community
5 solar. Currently, that's kind of a mess. It's not
6 available to community choice programs.

7 There are other tools that we've looked at.
8 We've done a lot of research. Our local water agency
9 actually did a year-long study. We currently offer a 100
10 percent locally produce inside our territory renewable
11 product. It's called Evergreen. And it's renewable day
12 and night and it has all of its RA from renewable sources.
13 And that's unusual, but that model is out there now. And
14 so that's one form of community energy. It's not just
15 solar. In fact, it's geothermal today, but we're adding
16 solar to it. And those contracts have been signed.

17 So there is good tools out there for innovating,
18 and CCAs are taking advantage of that.

19 COMMISSIONER GUZMAN ACEVES: So I just came back
20 from two weeks of a proceeding in the Central Valley with
21 the communities in Merced and Madera primarily, Tulare as
22 well. And this was a proceeding dealing with communities
23 going without natural gas. A lot of them are using propane
24 to heat and cool and all their other cooking needs.

25 And I just can't help but see a parallel with

1 Geof, some of what you see with direct access coming into
2 CCAs. And the kind of more macro level that I see of CCAs
3 into the IOU territories. There's a parallel there for me.

4 And part of it is this question of your
5 obligation. You know, Commissioner Peterman was asking
6 your obligation electric vehicles, but what's your
7 obligation on equity at a statewide level? And I've asked
8 this in our previous en banc, I know.

9 But this is -- there is an obligation for your
10 CCA customers and what is the obligation statewide to
11 procure efficiently and renewably for poor customers? What
12 is your obligation to those communities that we just
13 visited where we're considering investing to get them more
14 reliable energy, affordable energy. How do your customers
15 contribute to that?

16 MR. SYPHERS: I think there's two answers. One
17 is we have a lot of poor customers in our own territories.
18 And Lancaster and Apple Valley and Placer County and those
19 regions are good examples of that. Lancaster has 46
20 percent, I believe, customers that qualify for the discount
21 and they're serving those customers. And those models are
22 now being taken out.

23 And the second part is the CalCCA trade
24 association, which is a member organization of all the
25 operating programs, is going out to the state and offering

1 the lessons learned about how to do this and bring the
2 benefits to other regions. And so that's something that's
3 available to all of those regions.

4 So Salinas is working on, with Monterey for
5 example, on their program. And they have some important
6 areas down there that we need to be helpful to. But if
7 Fresno were knocking at our door, or if we went to them, we
8 absolutely want to help them take advantage of these
9 benefits.

10 COMMISSIONER GUZMAN ACEVES: Okay, just so I'm
11 clear, so your answer is reflecting that there's no kind of
12 pooling or shared responsibility across the board? You're
13 saying everyone should regionalize and is there no shared
14 responsibility across the territories?

15 MR. SYPHERS: So we have, through transmission
16 delivery rates, we have a massive amount of capacity in
17 California providing resources to the entire IOU
18 territories. And so that's something that exists now and
19 that doesn't go away. With community choice programs, all
20 of our customers still pay for all of those resources
21 still, the so-called CAM charge and those kinds of things.
22 And those don't go away. So that's really part of the
23 equation still.

24 The legacy hydro assets of organizations like
25 PG&E is an open question. How do those continue to benefit

1 all customers in California, because they're such long
2 lived projects. And I think that's something I don't have
3 an answer to. But I would invite a good discussion on,
4 because we want to make sure that everyone continues to
5 benefit from those.

6 And I think my deeper question is what better
7 organization than local public agencies is there to
8 represent low-income folks? And so I would invite a
9 coordinated effort, as you're suggesting, with those
10 regions to have that conversation.

11 PRESIDENT PICKER: So I'm going to try to insert
12 one last question before we break for lunch. And then turn
13 it back to Sue Tierney in case she has any questions. But
14 -- oh, I'm sorry, go for it.

15 COMMISSIONER DOUGLAS: Should I go ahead?

16 PRESIDENT PICKER: Yeah.

17 COMMISSIONER DOUGLAS: I just had a quick
18 question on community solar. You know, given your interest
19 in California and California policies and markets obviously
20 for the community solar model, how do you see community
21 solar working with community choice aggregation, working
22 with utilities, you know, what do you see as the initial
23 key market for it?

24 MR. CRAMER: Sure, I think there's probably not
25 one answer to that question. There are a number of ways

1 you can do it, it really depends on where you want to focus
2 first.

3 I mean CCAs has Jeff noted there are ways to
4 provide 100 percent renewable options, but then you get to
5 the question of a direct connection to a direct project and
6 a direct bill of credit for that project. Within GTSR
7 there's a program for the IOUs to offer it, but that
8 program based on its design doesn't really work at this
9 point.

10 Then you go to ECR and you say well, how can we
11 fix that program? And there are certainly some changes to
12 the administrative requirements that could work. There's
13 an open debate. I'm not going to stake a flag on how the
14 PCIA should be treated, but there is certainly an argument
15 to say that it could be changed and that could be fair to
16 all ratepayers. And that could expand access.

17 But I think where I'd go back to is in my
18 presentation, noting that if there is a policy goal to
19 expand access in the short term whether you want to call it
20 a pilot or a phased approach, you might almost call it a
21 value of death (phonetic) between no projects on the ground
22 to getting projects on the ground. There are 10-20 large
23 community solar providers building projects across the
24 country right now, but they're not active here, because the
25 program doesn't work. So perhaps changing with an ECR

1 could be the first step, some of the administrative
2 requirements and planning with the competition rate.

3 PRESIDENT PICKER: So this is sort of the meta
4 question for me. But the previous panel, Mr. Byron asked
5 or stated that markets are brutal. And so here we have the
6 gantlet thrown down by new direct access to the CCAs and
7 them some arguments that they may need to have some
8 protection.

9 This seems to me to be back where we started, not
10 in 2000-2001, but where we started in the 1890s when the
11 rhetoric around transportation markets, particularly the
12 railroads, was around calamitous competition or ruinous
13 competition. And in order to have universal access and
14 reliable service, they created the Public Utilities
15 Commission to protect franchises for specific railroads in
16 exchange for providing that reliable, affordable and
17 universal service. So I think that goes to Commissioner
18 Guzman Aceves's question about universal service.

19 And it just looks like to me there's an enormous
20 amount of potential competition and particularly where
21 there is true customer choice, where people can make up
22 their own minds about and become self generators, who's
23 safe? And in that which contracts are we going to protect?

24 We've had a call here for forcing investor owned
25 utilities to divest themselves of their contracts, because

1 they're so oversupplying in California. But it looks to me
2 like that persists in other arrangements as well. If
3 rooftop solar continues to be successful, what does it mean
4 that those customers are departing from the CCAs? If
5 direct access customers continue to depart from the CCAs
6 are they safe, so are your contracts safe? Shall we
7 protect your contracts over the regulated utilities?

8 And I have no idea what the answer to this is,
9 but that's the meta question. So if you have any
10 observations that don't ruin my lunch, please quickly given
11 them to us.

12 MR. PERRY: The interesting question about that
13 is you actually already have that obligation.

14 PRESIDENT PICKER: Yeah, we do.

15 MR. PERRY: Today, under the CCA licensing rules
16 if they come to you with stranded costs, their own PCIA
17 next year, which I believe Sonoma doesn't have any today,
18 correct? There are no exit fees imposed except \$25 and \$5,
19 right?

20 MR. SYPHERS: Yes. Yeah, we don't have exit
21 fees.

22 MR. PERRY: Okay. Because you have an embedded
23 resources that are out of the money, so when they do
24 they'll come to this Commission and ask you to approve an
25 exit fee.

1 MR. SYPHERS: We actually have significant out
2 of market contracts now.

3 MR. PERRY: Right, and so you're going to be
4 asked to do that. And the problem is you didn't approve
5 them to build it.

6 PRESIDENT PICKER: Okay.

7 MR. PERRY: Unlike the utilities where they had
8 to go through an LTPP planning process, and RFP process
9 that was approved by this Commission, the CCAs can go forth
10 and build anything they want to. And then come to you for
11 a post-approval consent to pass those costs on to consumers
12 who got things in the mail that said, "Do you want to opt
13 out?" And they were bound to a 20 year contractual
14 obligation. That's unique to me.

15 PRESIDENT PICKER: Well, let me build on that. I
16 mean that would take it to 2000 where we have a turbulent
17 market immerging here, it's unpredictable. And they were
18 already seeing contract failures or at least failures of
19 generators in this market, because the utilities don't own
20 it. What happens when nobody's contract means anything
21 anymore here in California? Can we get the investment from
22 third parties and from the independent power producers that
23 we need to actually continue to keep our system working?

24 MR. PERRY: So that's why, in my conversation, we
25 put this notion of a five-year forward look. I can't build

1 one year assets, economically. But I can build five-year
2 storage assets economically. Give me a look to that far
3 out, I'll put money in the ground. CCAs make an assumption
4 they're going to be around in 20 years, that these rolling
5 contracts will continue to persist. But contracts make the
6 difference and real contracts get funding, right?

7 Today I can't do it, because I don't know what
8 the utility rules are going to look like, and the rates are
9 going to look like, and the comparables are going to look
10 like.

11 PRESIDENT PICKER: But that's not regulatory
12 drag. That's an artifact of what it takes to invest in
13 this long lived infrastructure in terms of gaining return.

14 MR. PERRY: Except that the regulatory drag is I
15 can't see that price today. I get a one-year look and then
16 next year's PCIA pops up and next year's supply portfolio
17 kind shows its head.

18 MR. SYPHERS: So I'd counter that the evidence so
19 far in the last few years has shown that CCAs can and do
20 build resources as quickly as we need to. And the
21 producers are getting the financing. That the banks are
22 taking out those loans. And that system is working.

23 I think you're raising an important question,
24 though. I don't want to dismiss the question, because the
25 reality is, is when you have an opt-out market that was

1 thought of as competitive, but isn't because the IOU cannot
2 compete, their shareholders cannot win and they cannot
3 lose, so they don't care. And because of that, there is an
4 imbalance of power. And so the CCA is in a more fragile
5 state than it should be, because all it takes is one bad
6 year in the next 20 years and you have a problem. And so
7 that is a problem of market design.

8 But evidence so far shows that that's not an
9 issue, at least with the construction of assets. But I
10 lived through the energy crisis too and I do want to build
11 a stronger system, so I'm with you on that.

12 PRESIDENT PICKER: Our RECs worked great right up
13 until 2000.

14 MR. SYPHERS: Right, exactly.

15 PRESIDENT PICKER: So I've ruined my lunch. I'm
16 sorry. (Laughter.)

17 MS. TIERNEY: I was going to ask if anyone else
18 here --

19 (Audio cuts out.)

20 MR. CHASET: For those on WebEx we will be
21 reconvening at 1:30. Thank you.

22 (Off the record at 12:18 p.m.)

23 (On the record at 1:34 p.m.)

24 PRESIDENT PICKER: Hi. As everybody sits down,
25 I'm just going to say a few words about the facility that

1 we're meeting in. This is a building was actually built by
2 the City of Sacramento on the City's old parking lot on
3 behalf of the State of California as the CalEPA building.
4 Mayor Joe Serna, Jr. fought long and hard with the mayors
5 of 12 other adjoining communities to actually win the bid
6 on this project over Greenfield projects throughout the
7 region. And essentially, the Wilson Administration chose
8 this, because of the access to mass transit. And it was a
9 successful argument about concentration of office and
10 housing as a means of overcoming both transportation
11 congestion and air quality.

12 So I think it was a very interesting point in
13 Sacramento's history. Probably the only part of the issue
14 that Mayor Serna did not win is that he favored having
15 cotton woods instead of the coastal redwoods that you see
16 planted in the courtyard out front. They're non-native
17 species. They don't thrive well in the heat, but the
18 landscape architects won out. So again, thanks to Joe
19 Serna for his hard work to get this Class A building, one
20 of the fist of the league buildings in Sacramento and
21 downtown.

22 So with that, I'm going to turn the agenda over
23 to Mr. Orans for this next panel.

24 MR. ORANS: Thank you. I follow everybody else
25 in agreeing that this is a very important topic to have.

1 We've kind of been for 15 years using the same model that
2 we've used to fix the energy crisis. We're seeing now
3 competition not only at the wholesale level, but
4 competition for the first time at the distribution level.
5 And we've cracked open the door through various proceedings
6 and technologies, so we have both of them moving at the
7 same time.

8 So the difference really between this proceeding
9 that you would have, and the one that we all had to even
10 prior to the crisis, is if you were going to provide open
11 access, more retail access, I think you're going to have to
12 consider both the distribution level and the transmission
13 level. What the comings and goings rules are for all of
14 those and how that would work.

15 I have a panel here of three utility executives
16 who have thought long and hard about the issues for the
17 utility, what it looks like in various cases and I've asked
18 each of them to take a different part of the problem. I've
19 asked Dan Skopec to basically look at what the lift is for
20 the State of California, more broadly on the policy side.
21 That is what are the policy drivers that any of these
22 models need to be able to accomplish.

23 And then I've asked Caroline Choi to basically
24 look at just some of the characteristics of some of the
25 other models from other jurisdictions.

1 And then finally, kind of in the third position
2 I've asked Steve Malnight to say, and if we were looking at
3 any of those models given the lift that Dan lays out, what
4 would the score card look like for them?

5 And not rating them, but what are the things that
6 each of them needs to be able to do. And so hopefully,
7 then we've got distinct presentations. I've asked them to
8 go for about ten minutes each, so we should have more than
9 half the time left for good active lively discussion.

10 Now, I'd like to turn it over to Dan Skopec.

11 MR. SKOPEC: Thank you, Ren. And I share your
12 appreciation for the convening of this en banc,
13 Commissioners. It certainly is a very important topic.

14 Before I talk about the lift, I do want to have a
15 little bit of an historic perspective. And I think we all
16 know the tremendous leadership of the state of California
17 has portrayed in energy and environmental policy over the
18 decades. I don't need to go through that leadership to a
19 great extent, but I do want to point out one particular
20 element of that.

21 And that is what the California electric sector
22 has accomplished since 2006, since we passed AB 32. And
23 just as a reminder AB 32 set a goal of reaching 1990 levels
24 of greenhouse gas emissions by 2020. And I remember that
25 moment and I remember a lot of people saying, "We'll never

1 get there." Well, here we are in 2017 and we're almost at
2 that 2020 point. What is the electric sector accomplished
3 on that path?

4 And in 2014, you may be surprised to know, the
5 electric sector was actually 20 percent below 1990 levels
6 of greenhouse gas emissions, three years ago. By 2020, we
7 estimate that we will be somewhere between 30 and 40
8 percent below 1990 levels of greenhouse gas emissions. And
9 just as a reminder, the SB 32 target is that we will be at
10 40 percent below 1990 levels by 2030. So the electric
11 sector could be ten years ahead of where it needs to be.

12 Now, that's not to say that we're going to slow
13 down. Certainly, if you listen to the discussion today, we
14 know that there's a lot more for us to do. But it is
15 important to remember that accomplishment as we talk about
16 potentially restructuring this sector. So as Ren said,
17 what is the lift? What are we going to need to do to meet
18 those 2030 goals?

19 Let's start with renewables. Today, we have
20 about 26,000 megawatts of installed capacity renewables,
21 statewide. That's about a 27 percent RPS. SDG&E, by the
22 way has a 43 percent RPS. I'm sure you've never heard us
23 mention that before, but I just want to make that point.
24 By 2020 to get to a 33 percent RPS we're going to need
25 about 31,000 megawatts installed capacity renewables. And

1 to meet the 50 percent RPS we're going to need 47,000
2 megawatts of renewables. So that incremental 21,000
3 megawatts comes at a cost, we estimate, of about \$40
4 billion. That's just the generation component, not
5 transmission. I didn't calculate the transmission as it's
6 unclear how much of that will be needed.

7 The CAISO, of course, has done a great job of
8 educating all of us about the duck curve and the potential
9 for over-generation of renewables during certain periods of
10 time. So a lot of people say, "Well, let's make sure that
11 we have adequate energy storage to accommodate and to
12 integrate those renewables." And the State Legislature and
13 the PUC and the CEC have done a great job of pushing out
14 energy storage programs. We've been fortunate to be a
15 leader in that space and others have been as well.

16 But I can't sit here and tell you how much energy
17 storage we're going to need by 2030. I don't know if
18 anyone really knows the number. But I will tell you that
19 if you're just talking about just lithium ion batteries,
20 every 1,000 megawatts is about \$2.5 billion. So do we need
21 5,000 megawatts of batteries by 2030? Do we need 10,000?
22 10,000 megawatts is another \$25 billion, so that's on top
23 of the 40 billion for the renewables. Because you know
24 that the batteries aren't producing new electrons. They're
25 allowing us to use the electrons at a time when our load

1 demands it.

2 Okay, so now let's talk about transportation. We
3 all know that transportation is the major source of
4 greenhouse gas emissions in this state. We know we're
5 going to need to reduce our reliance on petroleum and to
6 reduce greenhouse gas emissions in this sector.

7 So I'm going to use San Diego base numbers, but
8 we can extrapolate statewide. Today, we have about 23-
9 24,000 electric vehicles in San Diego. And the Governor
10 has set a goal in an executive order, by 2025 he wanted to
11 see 150,000 electric vehicles in San Diego, 1.5 million
12 statewide. But to meet the 2030 goals we're going to need
13 1.5 million electric vehicles in San Diego alone. We're
14 going to need 15 million or more statewide. That's a 60
15 fold increase.

16 And then, of course you're going to need the
17 charging infrastructure that goes along with that.

18 So clearly, it's a big lift. It's a lot of
19 money. It's a lot of investment. And the policies that
20 are in place today are driving that, whether we have new
21 policies or not. So as we are talking about restructuring
22 this sector we have to keep in mind our past success and
23 how far we have to go.

24 Now, on the earlier panels, a really great
25 discussion that took place in some of the earlier panels

1 and there was a lot of talk about wholesale deregulation.
2 And I want you to know SDG&E is open to this discussion.
3 We're open to different procurement models and we're open
4 to potentially a future where we exit procurement. We're
5 happy to have that conversation, but we think that if we're
6 going to go down that path, four things need to happen
7 before we go there.

8 First, we have to address legacy costs. And some
9 people think well this is just the California IOUs
10 complaining about their long-term contracts. That's not
11 the case. Anytime anywhere across the world we've ever
12 deregulated an incumbent industry: telecom, water,
13 transportation, energy, the first thing you have to do when
14 you decide to deregulate is address legacy costs. So we
15 have to do that. We can talk a little bit more. I think
16 Steve will talk a little bit more about how to do that.

17 The second is you have to figure out who does the
18 new build. Who does the planning and who does the new
19 build? I talked about all the infrastructure that needs to
20 happen. You heard earlier that there's not a lot of
21 procurement going on. That's right. That's a question,
22 who is going to be the one building this infrastructure,
23 going forward and do they have the capacity to finance it?

24 The third is what are the procurement models that
25 are going to be employed? One thing that we know about

1 Californians is we love to pass new policy. Every year
2 there's a couple of new bills telling how we should procure
3 clean energy technology. And a lot of people talk about
4 the RPS. Yes, the RPS is a mandate, but it's a mandate
5 that has a market mechanism within it. But we have a whole
6 lot of other policies underneath the RPS that are causing
7 us to procure renewables. We've got the RAM. We've got
8 the ReMAT. We've got the BioRAM. We've got the Self
9 Generation Incentive Program. And so as you start to layer
10 on more and more of those mandates, you get much less
11 efficient procurement.

12 And so I commend the Commission for its efforts
13 on the Integrated Resource Plan. They're trying to address
14 that issue, as we speak. But going forward in the future,
15 it's going to be essential that we focus on the goal. As
16 Chairman Weisenmiller said the goal is to reduce greenhouse
17 gas emissions. And our procurement policy should be geared
18 towards that.

19 And the last is rate reform. I think you all
20 know what I probably will say about rate reform. But
21 actually I'd really like to just point to the PUC Staff
22 White Paper, which I think made this point really well.
23 And I'm paraphrasing obviously, but we live in a world
24 where we're asking our load serving entities whether it's
25 the utilities or someone else, to provide all kinds of

1 services, right? But we're only charging them for the
2 electrons. We charge them in a volumetric rate, cents per
3 kilowatt hour. We can't continue to do that, because yes,
4 for many of our customers, we are providing electrons.
5 Other customers we aren't.

6 But we're also providing transmission services,
7 distribution services, customer services. We're providing
8 resource adequacy. We're providing safety. We're
9 providing reliability. We're providing other public
10 purpose programs.

11 And so we have to find a rate structure that
12 allows people to pay for the services that they use and get
13 compensated for the services that they provide. Today's
14 rate structure doesn't do that. There's lots of ways that
15 we can talk about to do that, but I think rate reform needs
16 to happen as we move to this transition. So we're open, as
17 I said SDG&E is open to different procurement models, but
18 we have to address those four things. Thanks.

19 MR. ORANS: Thank you, Dan.

20 One just quick summary of the lift, Dan was
21 teasing me that I speak pathways and he doesn't speak it.
22 So I did a little exercise of adding up all the money in
23 the electric sector versus all the fuel. And I think it's
24 useful to think about the whole picture here, is there are
25 various cases as you guys know, the scenarios are various

1 cases. But there's about \$40 billion to \$50 billion per
2 year of revenue requirement and fuel in the power sector.
3 And those are included, if we evolve any of those models
4 we'll have \$40 billion to \$50 billion.

5 The good news is we're basically investing, and
6 that could like it's going up with various investments in
7 the Grid, various investments in batteries, etcetera. But
8 they largely are offset by fuel costs. There's \$100
9 billion, so double that amount in other fuel purchases in
10 the economy.

11 So if you look broadly at the width that Dan
12 calls it, it's really how do we get the investments to be
13 able to mitigate the \$100 billion? And I'm not counting
14 the GHG emissions, but the \$100 billion in fuel. The
15 pathways analysis is it's not a huge net. Worst case,
16 maybe it's \$10 billion more if you net the fuel against the
17 capital on the electric side.

18 But that is really the challenge. How do we get
19 people to invest and net out the other fuel costs?

20 PRESIDENT PICKER: You're including
21 transportation fuels in that?

22 MR. ORANS: Yes. I'm including all the
23 transportation fuels in.

24 With that I would like to introduce Caroline
25 Choi. She is a Senior VP of Regulatory Affairs at Edison.

1 And prior to that she worked at Progress Energy. And she's
2 going to tee up a discussion broadly of other models that
3 should be considered in thinking about this restructuring.

4 MS. CHOI: Thanks, Ren.

5 Good afternoon and thanks for the opportunity to
6 speak. I think this is a really important forum, as others
7 have said. And thinking about future frameworks and
8 certainly thinking about the essential nature of the
9 product that we deliver and how important it is to quality
10 of life. And as Dan just talked about, just thinking about
11 electricity now being allowed to (indecipherable) even
12 further as we go into the transportation sectors.

13 And then the customer impact. This has come up
14 already earlier today, but not just in terms of the total
15 impact the societal customer impact. But how do we relay
16 the benefits and the costs associated with these different
17 changes to the "What's in it for me?" to the individual
18 customer. Because that's how they think about these
19 things.

20 And also, just the value of the Electrical Grid.
21 I mean it is one -- I think we've heard how it's an
22 engineering marvel, but it does touch so many homes and
23 businesses. So how do we leverage the value of that,
24 leverage the infrastructure that's in place today?

25 And then, of course, here in California the

1 leadership that we've shown in energy and environmental
2 policy. Our goal, as Chairman Weisenmiller said, to
3 decarbonize the California economy and improve air quality.
4 And to do that in a way that others could follow, setting
5 that path and demonstrating that it can be done.

6 So right now I'm going to talk about a few
7 examples of states and other places that have taken on this
8 challenge or what we might learn from those. So we've
9 heard a lot, of course, about Hawaii. And it's a high cost
10 state. But it has a number of customers who adopted
11 distributed energy resources.

12 And so in that space, they've had because of the
13 rapid adoption, real challenges in integrating those
14 resources and operating the Grid reliably. I don't know
15 that it's necessarily a retail choice example for
16 California, but it's certainly I think one where we see --
17 and certainly from Southern California Edison's
18 perspective, the need to be ready. The Grid to be ready
19 for that rapid adoption of distributed energy resources as
20 customers take on these technologies whether they're
21 rooftop solar or electric vehicles or more storage.

22 New York, we've certainly heard a lot about the
23 New York REV. In New York, it's the -- has full retail
24 choice. The state through NYSERDA is the one that's
25 responsible for the procurement of both the renewables and

1 energy efficiency. To date, the agency hasn't fulfilled
2 what the expectations are in hitting the goals for the
3 state. And the Governor has, I think you're aware, put out
4 a clean energy standard proposal. And the New York Public
5 Service Commission is grappling with how best to implement
6 that.

7 Do they maintain the responsibility with NYSERDA?
8 Is it something where they should ask the utilities to take
9 on that responsibility, contract for those resources, sell
10 the RECs back to LSEs? So I think in New York, they're
11 also grappling with this procurement responsibility. And
12 where it'll actually land going forward as they move
13 forward trying to implement their clean energy efforts.

14 Texas is certainly a model. And Ren, I know your
15 paper talks about Texas as maybe the model for the skinny
16 utility, where the utility is essentially the wires
17 company and there is full retail competition, which in a
18 market, you are grappling with the implications of those
19 market prices that arise in such a situation. And the
20 challenges there I think that we see are around the
21 planning, right? So if you have full retail competition
22 there have been situations that have arisen in Texas around
23 the integration of those renewables, how you integrate all
24 the western Texas wind into the markets.

25 We were talking earlier at lunch about just the

1 price rate designs that people are offering, free nights
2 and weekends of electricity and things like that. So
3 planning around the system and particularly in Texas, not
4 having a very aggressive renewable portfolio standard, or a
5 greenhouse gas goal. So how California, if they adopted
6 such a mechanism would adapt that system to the goals the
7 state has, I think is something that we'd have to grapple
8 with.

9 So here in California, of course we have I think
10 what we might consider a hybrid structure where you have
11 limited direct access. You have open customer community
12 choice aggregation. And then a generous net energy
13 metering program that has combined providing some modest
14 growing retail choices for customers. And balanced with
15 California's leading in energy policy space, in renewables,
16 in storage, in energy efficiency, in electrification. And
17 so this is a consideration I think as the state considers
18 future models. Because as California goes, so does the
19 rest of the country, albeit at their own pace. And
20 sometimes with their own tweaks, based on their local
21 conditions.

22 So I think the bulk of California's energy policy
23 as we've seen in the past have really relied upon the
24 investor owned utilities to help implement that, to help
25 implement that social policy. So they think about the

1 future. How do we do that going forward as we introduce
2 more competition, more retail choice?

3 Certainly the role of the distribution utility is
4 evolving, because of the technology that's been coming
5 along and adopted by our customers. The declining cost of
6 PV systems and energy storage has already been noted
7 earlier. And we see the financing innovation that's also
8 made this technology more available to customers, so we
9 know that additional innovative technologies are coming.

10 The utilities have the challenge of integrating
11 all these resources into the Grid to plan for those
12 resources. As well as planning for the use of those
13 resources as Grid services, while maintaining the
14 reliability and safety of the Grid. Maybe even enhancing
15 the reliability and safety of the Grid with these
16 resources.

17 So as Dan mentioned we do believe that the
18 Commission has to deal effectively with the transition to
19 any new structure, including addressing the existing costs
20 and cost allocation. As an example, many of you know that
21 L.A. County has recently voted to move forward with
22 community choice aggregation. Should the county and all
23 the cities depart SCE's service for procurement, the
24 current cost mechanism would have approximately \$250
25 million uncollected from the departing load and landing on

1 the remaining bundled customers for the utility. That's
2 based on today's prices. So we do believe that this needs
3 to be addressed. And it's not tenable as we look forward
4 to more CCA formation and departing load.

5 And the proposal, and I know Steve's going to
6 talk about this more, we believe it is a transparent one
7 that we've proposed where the PAM addresses the procurement
8 issues and the cost allocation and the value of those
9 resources that have been procured already.

10 So just in closing I would say, as we move
11 towards a new future state, we have to manage the present
12 and deal with the costs that are existing today. So
13 thanks.

14 MR. ORANS: Thank you, Caroline.

15 With that, I'd like to introduce Steve Malnight,
16 who's the Executive VP of Strategy at PG&E. And he's going
17 to focus on what the score card on what any of these models
18 needs to be able to do.

19 MR. MALNIGHT: Thank you, Ren. And thank you
20 President Picker, chair Weisenmiller, Commissioners. I
21 appreciate you all making the time for this day, setting
22 aside your time in your busy schedule to talk about what I
23 think we all agree is a critical issue for California going
24 forward.

25 I think my two colleagues here set this up very

1 well on the lift that we have in front of us to maintain
2 and achieve the really aggressive goals that the state has
3 laid out. And some of the options that are available to us
4 as we think about different ways to go forward.

5 As I think about Ren's question, the key thing
6 that I sort of believe is we need to start talking about
7 what do we do to get from here to there? What do we do to
8 get and then make sure we're making the right choices as a
9 state, in understanding the options in front of us and
10 picking the one that's right for us? So that's kind of how
11 I'm going to address this conversation. What do I think we
12 need to do in order to really address these questions and
13 come to the best conclusion for California.

14 Because I think we should all acknowledge while
15 we can look out across the world and see models, different
16 models that work, that is absolutely true. There are many
17 models that we could choose. Our objective really is to
18 choose the one that's right for California given our unique
19 goals, our unique objectives, and the customers that we
20 serve here.

21 So first and foremost, I do think and I agree
22 with Dan and Caroline, but also with Mr. Syphers from
23 Sonoma Clean Power who came up earlier, and acknowledge
24 that one of the things we have to first address if we want
25 to move forward is the question of PCIA, exit fees, however

1 you want to talk about it. It's fundamentally this
2 question of how do we deal with the past decisions that
3 have gotten us to this incredibly successful place.

4 The fact is I think Dan starting us off
5 appropriately, recognizing that California is not today the
6 example of a failed model. California is an incredible
7 success story of a transformation in our energy sector to a
8 clean energy economy. And we're looking to move that
9 forward. So recognizing that success, how do we deal with
10 transition from where we are today to where we need to go?

11 I think all parties acknowledge the PCIA is in
12 need of reform. It is a mechanism that really was created
13 when CCAs and competition was a glint in our eye. Was an
14 idea that was beginning as opposed to what it is today,
15 which is a segment that is a substantial provider of energy
16 services to California. In PG&E's territory, by the end of
17 this year, we'll have about 20 percent of the load served
18 by CCAs in direct access. I think that as we've seen, many
19 are coming up with innovative options and creative
20 approaches for customers.

21 The challenge is that that outdated mechanism
22 does leave costs behind, because it relies on outdated
23 benchmarks that don't accurately value the portfolio that
24 the PG&E has procured. So what's the impact of that? By
25 the end of the year we're estimating it will be about \$180

1 million that's left behind for the customers who are still
2 bundled customers. But what we're also observing is that
3 the growth is happening much faster than many of us
4 expected. And by 2020, just a few short years away, we're
5 already projecting about half of the load for PG&E will be
6 served by DA or CCA providers.

7 By that time if left unchecked, we start to see a
8 cost shift of a half a billion dollars. And I know,
9 compared to the numbers that Dan mentioned earlier, that
10 doesn't necessarily sound like a lot. But to put it in
11 context, for a customer in Bakersfield, a community that's
12 not necessarily pursuing community choice aggregation and
13 have other issues that they're focused on, the customers
14 who are left behind who may be high users in a hot summer -
15 - that's \$100 to \$150 a year of an impact on their bill.
16 And that's a meaningful impact that we all need to address.

17 So how the utilities have proposed to address
18 that is through the Portfolio Allocation Mechanism, which
19 we've put before the CPUC, and we urge you to begin the
20 process of deliberating on. The PAM, as we've called it,
21 is a mechanism that addresses many of the concerns that
22 parties have raised. It's a transparent mechanism that's
23 clear, and importantly it addresses what I think Mr.
24 Syphers earlier today mentioned or talked about, as a
25 double procurement problem. Let me just clarify what I

1 think that actually is and just put it into context here.

2 The double procurement really results from the
3 fact that when PG&E initially was procuring resources, say
4 in 2008, to achieve the state's aggressive RPS goals, we
5 were forecasting that we needed to serve the majority of
6 the customers across PG&E service territory. And we were
7 signing long term contracts in order to drive significant
8 investment in the state and achieve our goals.

9 That procurement happened. It happened in our
10 long-term contracts between two counterparties. And it was
11 vitally important, because that contract was what attracted
12 that capital. As the Sonoma Clean Power or other CCAs were
13 formed, they started with the premise that they needed to
14 procure from zero and re-procure a new portfolio. That was
15 where the double procurement effectively happened when it
16 was procured again.

17 Now, we really have to recognize that the current
18 model doesn't envision the utilities or others handing over
19 contract to a CCA that's formed that requires consent by a
20 counterparty who may not like the creditworthiness of that
21 CCA. It doesn't also envision that PG&E would enter into a
22 brand new contract with a CCA to take that load. There's
23 not that mechanism in place. The utilities are not
24 designed to be market makers. We're designed to procure
25 energy for our customers.

1 So that PAM resolves that problem by transferring
2 to the CCAs the benefits associated with that portfolio,
3 including the renewable energy credits and the resource
4 adequacy value. So that when a CCA begins, they don't have
5 to start from zero. They receive the benefits of the
6 portfolio that's already been procured.

7 So I think there are many issues that will need
8 to be discussed as a part of the PAM application. We would
9 urge -- I think all the utilities would urge the Commission
10 to take up that process and begin to resolve that issue.
11 Because under any scenario that we really envision for the
12 future, as Dan said, it has to start by dealing with the
13 legacy costs.

14 So once we take that on, I think it's important
15 for us to consider what comes next. What are the questions
16 that we need to resolve in a rulemaking or another forum
17 that the Commission may launch?

18 I want to suggest that it starts with a really
19 important question that we all have to deal with, which is
20 what is the primary priority that we have for our energy
21 system here in California? And it requires us to really
22 make some clear choices.

23 Now I could say things. For example, are we
24 focused on the lowest possible price for customers? Are we
25 focused on focused on the highest certainty of reliability

1 or are we focused on ensuring that we achieve our clean
2 energy goals? Now, of course the natural first reaction
3 for all of us is to day we want all of that. And I agree.
4 We wouldn't do one at the absence of the others.

5 But we have to recognize the inherent tension
6 that may exist between those choices. So just as an
7 example, if our focus is on the lowest possible price -- I
8 think Caroline mentioned the Texas model -- we can look to
9 that model and see that in many cases full retail open
10 competition is delivered. Great pricing innovation to
11 customers is delivered, very low costs, very low prices.
12 But what are the downsides to a model like that?

13 Well, a model like that will also procure the
14 lowest price resources in the market. It will not
15 necessarily go and seek to procure higher cost, renewable
16 energy, more innovative technologies, because its goal is
17 around lowest possible price.

18 How does it deliver reliability? Well, as
19 Caroline, I think mentioned earlier, when there are
20 shortages in the market it attracts capital by allowing
21 market prices to go very high. So that people can choose
22 to look at that market, make their own assessment about the
23 market conditions in the future and make investments based
24 on the opportunity to capture high costs.

25 I think we as a state have to decide what's most

1 important for us, between those three, and which we're
2 going to emphasize. When we do, I think we're going to
3 have to ask ourselves questions like, "Who is going to plan
4 and procure the resources in the future?" In any scenario,
5 what investment requires, the investment of a magnitude the
6 Dan mentioned, what it requires is the ability for
7 investors to look at our market. And see, with some degree
8 of certainty, what they can expect to receive in turn.

9 It will require either investors to make capital
10 investment decisions on their own and extract some kind of
11 return for that over time. Or to sell a contract to a
12 creditworthy country party, like of the utilities, to
13 ensure that they have confidence in their ability to get
14 that return on their investment. Those are the kinds of
15 things that we have to consider, who's going to procure?
16 And how do we ensure that certainty or at least that
17 visibility into the future is there, so that people will
18 make those investments.

19 Importantly, I also want to mention we have to
20 ask ourselves the question, who's going to serve the
21 customers who may not want to make a switch, who may not be
22 as engaged in energy? Or perhaps most importantly, who the
23 market might not want to serve. As we said before, there
24 are many customers who in California across all of the
25 utility service territories, who struggle every day to pay

1 their bills. They may not be viewed as the best credit
2 risk for a company to provide. But it's vitally important.
3 It's one of our societal roles to ensure that we are there
4 as the provider of last resort to serve all customers. And
5 that role is an incredibly important societal role that we
6 can't get wrong as we consider a structure for the future.

7 A few things important to consider, in many other
8 markets when you look out and ask how is the POLR provider
9 solved, it's important to remember the POLR provider in
10 most places, does not procure long-term contracts. They
11 are buying only the energy, usually in the short term, for
12 the customers who are left behind. So the POLR is not the
13 provider you count on to make the long-term investments.

14 And also, in most jurisdictions, the cost that
15 the POLR provider charges customers is higher than anyone
16 else in the marketplace. We have to decide how we want to
17 set that structure up, so that in California we achieve our
18 societal goals.

19 Finally, I think it's important that we talk
20 about pricing in a different way. Dan mentioned this, and
21 it is a critical issue. So traditionally we have talked a
22 lot about pricing. I've stood in front of you many times
23 and talked about different types of rate reform or NEM
24 reform. I would just highlight this. I think our
25 conversation has by and large been on things like time of

1 use rates, as a better proxy for market costs or should we
2 have a fixed charge? I think it's time for us to recognize
3 we're going to have to move beyond that in a market
4 structure going forward.

5 We have to have a different kind of conversation.
6 A conversation about what are the products, the real
7 products that customers receive from the Grid or from their
8 energy supplier, and how should each of those products best
9 be priced? Here's my example.

10 If we have a customer who has solar on the roof
11 top and a battery in their garage and an electric vehicle
12 in their garage, they may very well be a self generator.
13 They may actually meet all of their normal energy needs.
14 They may not count on the Grid for anything, but they
15 probably are not cutting that wire. Why not? Because the
16 Grid is always there to provide their resource even during
17 our solar eclipse or during the periods of sustained storms
18 or if their equipment fails, the Grid is there for them.
19 What's the product that the Grid provides at that time?
20 It's not really kilowatt hours. It starts to look more
21 like an insurance product. "I'm here to serve you when you
22 need it most and when you can't predict when you're going
23 to need it." And I think it's important to recognize that
24 if the Grid is an insurance policy, you don't pay for an
25 insurance policy when you need it. You pay for it ahead of

1 that time, because that's what the value is. It gives you
2 certainty to know it's always there.

3 So that conversation around pricing, around
4 procurement models and who's going deliver. And how we
5 serve the customers who are most in need of service, I
6 think those are vitally important questions for us to take
7 the time to get right. And the thing I would just, in
8 closing, urge you to think about is how we make sure that
9 we not only get these questions right, but deal with them
10 quickly. Because in the absence of us addressing them, the
11 market continues to move forward and the questions are
12 actually being answered for us.

13 So we have to create the space for all of us to
14 have the time to resolve these questions in the best
15 interests of California to make sure we get it right for
16 our customers. And PG&E for one is certainly happy and
17 looking forward for engaging in that conversation.

18 MR. ORANS: Thank you, Steve. With that I'd like
19 to turn it over to the Commissioners to ask questions.

20 CHAIRMAN WEISENMILLER: Let me just start with a
21 couple of foundation ones and then give probably the more
22 interesting one. The first one is just the proverbial,
23 have you guys procured anything that was not at the PUC's
24 approval, direction and approval?

25 MR. SKOPEC: Not that I can think of.

1 CHAIRMAN WEISENMILLER: Neither could I.

2 MR. SKOPEC: No, that I can think of

3 (indiscernible) count on.

4 CHAIRMAN WEISENMILLER: Okay. Do you profit at
5 all from procurement?

6 MR. MALNIGHT: No, we do not.

7 MS. CHOI: No, we do not.

8 CHAIRMAN WEISENMILLER: Okay. Do you, in turn
9 with decoupling, do you have any incentives not to pursue
10 energy efficiency?

11 MR. MALNIGHT: No.

12 MS. CHOI: No.

13 MR. MALNIGHT: As a matter of fact we have
14 incentives to pursue it.

15 MS. CHOI: Right, exactly.

16 CHAIRMAN WEISENMILLER: Right, I mean obviously
17 as we get into that, I'm sure Ralph will hit on the point
18 of making sure we're providing the proper incentives to the
19 entities getting into this business.

20 There seems to be a drift where you're moving
21 more to become a wireless company. Now how does that work
22 if we're back to the POLR, Provider Of Last Resort. Can
23 that work or how does that work? Is that something you're
24 prepared to do, what would it take? Or do we have to find
25 somebody who's going to step forward as a Provider Of Last

1 Resort?

2 MR. MALNIGHT: Well, I'll start off and then I
3 think these folks can take it over.

4 I don't think the current market structure works
5 for a POLR provider, because again we're really looking to
6 the utilities. We're putting mandates towards the
7 utilities to procure resources long term, to accomplish our
8 goals. These are above-market resources, resources that by
9 definition require a mandate to enforce the procurement,
10 because they're not always the most cost effective resource
11 that's available today.

12 When you do those kind of contracts, you really
13 need a sense of how much load am I going to serve? And as
14 a POLR provider, you recognize that there's great
15 uncertainty in my load service. I'm just kind of at the
16 whim of a customer who may choose to come back. You're
17 buying shorter term and the existing structure clearly
18 doesn't work in that model. It can work. And I think the
19 utilities certainly would say that's an important role that
20 we would be willing to take on. But we need a model where
21 the cost allocation mechanisms are right. And where we
22 have built a broad base model for all entities that serve
23 load to make sure that our mandates are applied equally
24 across the board.

25 MS. CHOI: So I would agree with what Steve said.

1 And I also think it's just moving to a wires only, because
2 I don't think with California policy particularly with its
3 clean energy goals, that the utility can just step away and
4 just be a platform for the delivery of products to
5 customers. So I think we do need to change the model and
6 particularly in how the costs are allocated and how
7 procurement is done. But I don't know that I would agree
8 that utilities are moving just to a wires only model.

9 CHAIRMAN WEISENMILLER: Well, at this point,
10 collectively you're running like, say a billion dollar
11 energy efficiency program. Again, looking into the future,
12 who does that? Do you continue to do it? What happens
13 there?

14 MR. SKOPEC: That's a very good question. I
15 mean, I think those are the kind of questions that we have
16 to ask. Who runs energy efficiency? Who runs demand
17 response? I think Commissioner Peterman asked who's going
18 to build electric vehicle charging? I think all those
19 questions kind of flow from the big questions that we
20 talked about today. Are we going to start this
21 restructuring process and who's going to be doing the
22 planning? Who's going to be doing the POLR?

23 So as Steve said, there's lots of models where
24 these things can happen across the country. We have a
25 heavy utility-administered energy efficiency program. Of

1 course, you know that much of that money is parceled out to
2 third parties to manage those programs already. And you
3 could have energy efficiency markets. I think that some
4 jurisdictions do that. And you'd have to evaluate how
5 effective those are, relative to the ones that we have in
6 place today.

7 MR. MALNIGHT: I would only add I think that in a
8 world where the utility is not serving the energy load for
9 our customer, we will not really be the most likely place
10 to serve an energy efficiency programs.

11 You really need to be able to work with customers
12 on how they utilize energy and provide them the right
13 resources to use it in smarter ways. That's a natural
14 reaction for the entities that serve loads. So frankly, I
15 think it becomes a significant question how we would run a
16 central energy efficiency program when we have a
17 significant dispersion in who serves the load.

18 CHAIRMAN WEISENMILLER: Well, the same question
19 on low-income. You guys have CARE programs. You have like
20 \$300 million of low-income programs. What happens with
21 that?

22 MS. CHOI: Well, CARE is funded through the
23 distribution charge. So all customers still benefit from
24 the CARE program, because that's the way it's funded. So
25 the utility could continue to operate that program, but

1 there are a lot of questions that I think come up as you
2 think about how you want to assign responsibility for
3 different portions of the service. Or if you want to
4 assign responsibility for procurement separately than
5 efficiency.

6 I do think it also ties to what are you trying to
7 achieve, what Steve teed up earlier. So is it about
8 achieving the clean energy goals of the state? Is it about
9 doing it at the lowest cost? And what is the priority,
10 because I think depending on how you answer those questions
11 will dictate how you then develop the programs and the
12 model that you want to go forward with, the framework.

13 CHAIRMAN WEISENMILLER: All right, the last one
14 is this. Obviously all of you are starting now major
15 charging programs and again in this new model, is that you?
16 Is that the CCAs? I mean who? Will you do charging on
17 everything but the CCAs? I mean how does it work?

18 MR. MALNIGHT: I think electrical vehicle
19 charging is one of those distributed resources that
20 actually has the opportunity to look like a lot of
21 different things. It can look like Grid benefit. It can
22 look like ability to help meet wholesale market needs. So
23 I think we have to think about all of those DER programs:
24 electric vehicles, distributed storage, distributed
25 generation.

1 If we're really trying to say how do we create a
2 program where all of those multiple value streams could be
3 captured from those resources? In a world where the
4 utilities are the substantial load serving entity,
5 plan/own/operate the Grid, it's pretty clear that there's a
6 strong incentive for the utility to help drive all of those
7 value streams. If the utility doesn't have access to all
8 those value streams, I think it gets much more complicated.

9 COMMISSIONER GUZMAN ACEVES: Okay. Well, one
10 proposal you guys have kind of put out there in terms of
11 how we manage this transition that seems to look
12 inevitable, are there different ways that you thought about
13 how to manage that, what pace or what structure should be
14 specific? And I'm sorry to not know if you've included
15 something explicit in your PAM proposal.

16 MR. SKOPEC: Well, I think regardless of the path
17 that we take on wholesale deregulation -- I think you heard
18 Steve say this -- we have to address the costs that have
19 already been put into place, because we're having de facto
20 wholesale deregulation happen with CCAs. With direct
21 access, despite maybe what we heard in the second panel
22 it's going take an act of Legislature to open up direct
23 access and expand it in the IOU territories. But we're
24 having CCA departure as we speak.

25 And so in our mind, the first thing you have to

1 do, is settle that legacy cost issue. I think all the
2 other questions probably could use a lot more thought. And
3 a lot more discussion whether that's OIR or what it may be.
4 But regardless of the path you take I think you've got to
5 address the cost shift that's happening vis-a-vis the PCIA
6 today.

7 MR. MALNIGHT: Okay. And if I could just add to
8 that? I mean, I want to make sure we understand also why
9 that's so, so critical.

10 I think we heard today communities are trying to
11 make decisions about whether or not the communities should
12 go community choice aggregation. Customers are trying to
13 make decisions today about, "Should I take advantage of
14 solar?" And I think we have to recognize right now they're
15 making those decisions in the absence of solid information
16 about the real economics of that decision and the real
17 long-term economics.

18 So to provide certainty to those communities, to
19 provide certainty to customers who are looking to take
20 advantage of solar or other things, I think it's important
21 that there be a strong signal sent that there's a sense
22 urgency to tackle this issue. And come up with an
23 appropriate response, so that we can kind of get on with
24 the business of making the decisions that are in front of
25 us today.

1 As Dan said, once you solve that, I think there
2 is time to resolve the big questions that are going to
3 require some substantial work from all of us.

4 COMMISSIONER PETERMAN: Just one point of
5 information on that, just so everyone's on the same page,
6 because a couple of folks have referenced the PAM proposal.
7 I just wanted everyone to know that the utilities filed an
8 application a few weeks ago with a proposal here related to
9 PCIA.

10 That application is assigned to me. We are
11 treating it with the utmost urgency. If anyone wants to
12 follow that proceeding I'm just going to read out the
13 application number now. It's A-17-04018. Thank you.

14 COMMISSIONER RANDOLPH: I wanted to ask a
15 question shifting from past costs to future planning
16 issues. In the CC, Jeff mentioned when we were talking
17 about procurement going forward, that the CCAs have RPS
18 requirements and RA requirements. And they view that as
19 sort of adequate to kind of carry that planning load in
20 terms in terms of trying to meet our goals and deal with
21 costs and reliability.

22 Do you think that those are adequate regulatory
23 mechanisms for long term planning? And I'm going to ask
24 the next panel the same question too, so those of you on
25 that next panel think about it as well.

1 MR. SKOPEC: I'm glad you asked that, because it
2 was interesting when I listened to that answer knowing that
3 in the IRP proceeding, which I know you're the assigned
4 Commissioner of, the CCAs fill that proceeding with
5 comments that the Commission doesn't have the authority to
6 instruct them to do X, Y, or Z. So that's a real conflict.

7 Is it going to be more complicated for the State
8 of California to manage dozens and dozens of load serving
9 NGs, IRPs? Of course it will be. But before you even talk
10 about complicated, you have to talk about do you have the
11 authority. It's clear you have the authority over the
12 IOUs, as it relates to the long-term procurement plan. And
13 you have that same authority as it relates to the language
14 in SB 350 that calls on the Commission and utilities to
15 create these integrated resource plans. But it's not clear
16 as it relates to CCAs.

17 And despite what I heard today, I know what I
18 read in the comments and they are pushing back very hard on
19 that.

20 MS. CHOI: And I guess I would just add that the
21 IRPs are really intended to help see whether the state is
22 going to achieve its goals, right? And so it's not just
23 the authority of having them do it, but it's the quality of
24 those plans, right? Because if they're not really detailed
25 enough or having the right -- they're all using different

1 baselines or different scenarios, I think it's really much
2 harder for the state than to understand whether or not it's
3 on track to achieve these really ambitious goals for the
4 state.

5 MR. MALNIGHT: And I guess the one thing I would
6 add is that I think that a key question for me is, if we
7 step back and say if the state's trying to make sure we're
8 accomplishing our goals, our environmental goals, in the
9 best way possible we can have a structure where they're
10 planned. Where there are many, many smaller plans that
11 sort of come together and we assert that they meet the
12 goal.

13 The question also is just are we achieving the
14 best state outcomes by optimizing across multiple small
15 plans or with a larger plan? I think that really is the
16 role of the CPUC through the IRP proceeding, is to look
17 holistically and say are we accomplishing the best outcomes
18 for the state holistically? And I think that is where some
19 of that tension is going to come in, in that proceeding.

20 MR. SKOPEC: If I could just make a quick
21 analogy, Commissioner Randolph? You know, if you think
22 about the water industry in California and its sort of
23 inverse related to the energy industry in terms of the
24 makeup of investor owned utilities versus municipal. About
25 80 percent of water utilities in California are municipal

1 and maybe 20 percent are investor owned. I think there's
2 something like 7,000 municipal water agencies, about 400
3 and some are urban water agencies.

4 When we were in a drought, you know it was clear
5 that we were going to have to do a number of things to
6 protect our water sources and to conserve energy. And
7 there was no doubt about that, but the jurisdictional
8 authority to do that was challenging. The Governor had to
9 issue three or four emergency orders. And the Water Board
10 had to write emergency regulations that pushed forward the
11 Governor's 25 percent reduction goal.

12 The Water Board did have fine authority to do
13 that. I don't know if they ended up fining anyone, but it
14 was a very messy process. I'm not sure how adequate it
15 was. Thank goodness we had a wonderful winter this year.
16 I don't know how much longer that process could have taken
17 place. But I think if I were sitting in the Governor's
18 seat and I looked at that process of how am I going to get
19 these water agencies to conserve versus how am I going to
20 get the energy industry to meet its greenhouse gas goals,
21 it's a no brainer what kind of structure I'd want to have.

22 PRESIDENT PICKER: Commissioner McAllister?

23 COMMISSIONER MCALLISTER: So thanks for your
24 comments. I guess I'm going to ask a question on energy
25 efficiency and then maybe a question about rates. So

1 you've laid out this potential scenario where we unbundle
2 services. And if it is a skinny utility and different
3 services are provided by different types of services
4 providers, so let's just think about building on Chair
5 Weisenmiller's question about the billion dollars in energy
6 efficiency.

7 If we do think that third parties are kind of the
8 solution for that how do we make sure -- and you can think
9 about other parts of it, DER or whatever, you can think
10 about different kinds of service, even ancillary service
11 providers. How do we ensure that those service providers
12 get the data they need to develop products and get to
13 customers with offerings that those customers actually want
14 to buy?

15 MS. CHOI: So, I don't know that it's all third-
16 party provided, but I can give an example. For instance,
17 the Preferred Resources Pilot (phonetic) that we have
18 underway right now. And we identify the need and then we
19 put out an RFO that's back, so there is an identified need
20 in a specific location. It's up to that third-party
21 provider when they're putting the bids in, in terms of
22 getting those customers to sign on to provide those
23 services over this many days or this many hours of the day
24 when it's called upon.

25 So I think it's providing a certainty of a

1 contract and then seeing the performance, but I think
2 that's what we're talking about when we think about third-
3 party providers for energy efficiency. Are they
4 aggregating these services and providing them back to the
5 utility as a Grid service to maintain reliability of the
6 system? Versus the customer-funded programs that the
7 utilities provide, so right now there's two. We've got
8 customer-funded programs and we've got third-party
9 providers.

10 And we want to make sure that for instance in the
11 PRP we were trying to make sure that we didn't have overlap
12 of those things, because we also contract for services
13 within the customer programs. We didn't want to inundate
14 customers with offerings from various parties all working
15 on behalf of Edison.

16 COMMISSIONER MCALLISTER: So but presumably you
17 facilitate getting customer-level data, so that they can
18 determine what the needs for that customer might be and
19 what the impacts of different measures they want to go at.
20 So that they can target the best opportunities, right? So
21 that's what I'm asking, really.

22 MS. CHOI: It depends on the -- yeah. So in the
23 PRP area we do tell them the types of customers that are in
24 that area, so they know the kind of programs that might
25 work best. So in a specific area it might be more

1 commercial and business customers rather than a residential
2 customer area, and so what are the kind of programs that
3 best appeal to commercial customers.

4 COMMISSIONER MCALLISTER: Okay. So I guess I'm
5 thinking of analogies like the Energy Trust of Oregon or
6 entities like that, that actually do almost act like a
7 utility with respect to some of these demand side programs.
8 And facilitating them in sort of an objective sort of
9 third-party way in a consistent manner, so I just want to
10 put that example out there.

11 So I also want to ask about rates. So there's
12 been a lot of suggestion that we need to deal with rates,
13 but not a lot of drilling in I guess. And my impression is
14 that -- well, I guess I'm wondering what your thoughts
15 about how that process -- I don't (indiscernible) asking
16 this, because I'm not in the other Commission. So sort of
17 upper level kind of thoughts about how we can get there in
18 a consistent manner with individual rate cases that often
19 end in settlement discussions, and therefore don't
20 establish precedent. How can we think through that in a
21 consistent way such that each one builds on the last, and
22 we get where we want to go in sort of a straighter line?

23 MR. MALNIGHT: I think it's important to first
24 acknowledge you mentioned some rate cases. I think we need
25 to also think about the rate-making model at the Commission

1 today. I mean, the individual rate cases really set our
2 revenue requirements. They don't do rate design and rate
3 implementation.

4 In rate design we have typically done through
5 OIRs or other structures recently with the residential
6 rates OIR. And I do think as we go forward in this model
7 and consider new models of competitive options, of
8 competitive providers, it's the right forum for us to ask
9 ourselves the critical question of how do we envision
10 customers paying for the products they're going to receive
11 from the grade or from competitive options, right?

12 If, for example, we decide to pursue a more
13 competitive path and open market, an open customer choice
14 market, we have to recognize we really won't have much
15 control of a rate design. By definition, those markets
16 innovate rate design on their own. As Caroline said, you
17 go to Texas and you may get a free nights and weekends
18 rate. You may get free energy during certain time periods
19 of the day, because that's the competitive market
20 innovating to win a customer over.

21 I think as a Commission and as an industry, we
22 have to ask ourselves what's right for California? And the
23 right place for us to do that is to deliberately ask
24 ourselves what is the products that are served today by the
25 Grid that we think should be competitively offered. And

1 people should compete against the utility to offer those
2 kinds of services.

3 What are the products that really only the Grid's
4 going to provide. And I think as Chair Weisenmiller said
5 earlier today, we don't necessarily want to see two wires
6 running down the street competing against each other. So
7 those kinds of products, we should make sure we're pricing
8 in such a way that you get the people who provide, who
9 invest that capital are going to get an appropriate and
10 customers get the right kinds of pricing signals and we
11 move forward.

12 So in my mind, there's plenty of space for us to
13 deliberate on those critical questions as a part of a
14 proceeding where we consider holistically, what's the right
15 market design we'd want to pursue.

16 PRESIDENT PICKER: So I'm going to ask kind of a
17 different kind of a question about the competition. And
18 there's a couple of different models that discuss how
19 California gets to its 2030 GHG reduction goal. I think
20 we've heard the word, pathways. Pathways suggests that we
21 need to actually see the electric industry displace about
22 20 percent of the use of natural gas in order to actually
23 get to our greenhouse gas goal.

24 So there's two corollaries. One is that you
25 can't get to our 2030 GHG goal by going to 100 percent

1 renewables in the electricity supply alone. That actually
2 comes down at some point to how we use the clean
3 electricity we're generating rather than what proportion of
4 the portfolio or our electric generation comes from
5 renewables. It's far more important as to how we use it.

6 But there are a couple of utilities, investor
7 owned utilities that are joint electric and gas utilities.
8 And is there an inherent conflict in them trying to pursue
9 that goal of factually displacing natural gas with the
10 clean electricity?

11 MR. SKOPEC: I don't think so. You know, I think
12 that what we've seen on the electric sector and the
13 statistics I mentioned earlier about the tremendous
14 progress this sector's made has been about an effort to
15 decarbonize the wires, right? Decarbonize electricity
16 decarbonized and then as you often say expand the
17 utilization of electricity into other sectors, so that you
18 start to decarbonize other elements of the California
19 economy.

20 The same thing can be done on the gas side. If
21 we had a concerted effort to decarbonizes our natural gas
22 sources, you can achieve that. Now, the pathways work --
23 you cited what may happen to the use of natural gas.
24 That's under one scenario. There is a scenario where you
25 decarbonizes natural gas and you could start to see other

1 uses. That's one of the reasons why we're so supportive of
2 the IRP process, because we want to see these different
3 technologies and these different utilizations of
4 technologies compete against each other to show what is the
5 most cost-effective way to reduce greenhouse gas emissions?
6 I know some people up on the dais are skeptical about
7 renewable natural gas. This may not be the place to argue
8 about that today, but let's let those technologies compete.
9 Let's see if they can win.

10 PRESIDENT PICKER: Well, I mean I guess my
11 question is do they compete well in a combined utility?
12 I'm just asking that.

13 MR. SKOPEC: I get to wear two hats as you know,
14 and the wisdom of our management was that we needed to have
15 separate management for the gas company versus SDG&E partly
16 for that reason, because they knew that they were dealing
17 with different commodities, different service territories.
18 And so I get to see that competition daily and I think they
19 do. We have conflicts from time to time, but I think that
20 -- I know that the gas companies are working very to try to
21 reduce the greenhouse gas emissions from its fuel.

22 And you know the results of SDG&E as it relates
23 to renewables, so I think they do compete well. It doesn't
24 mean, one that they're going to be equally successful. And
25 I don't think we know that today. The only thing we're

1 asking is don't send one of them on an off ramp today,
2 because that could be the winning solution ten year from
3 now, fifteen years from now, twenty years from now.

4 PRESIDENT PICKER: So somewhat in the same vein,
5 but not quite with the same issue, but the Legislature sort
6 of recognized the pathway model requires that clean
7 electricity has to displace the use of petroleum fuels and
8 transportation. And they did that in part, and correctly
9 by directing us to require the utilities to expend dollars
10 on the electrification structure for transportation.

11 And I'm struggling, again how do we then capture
12 that investment that the electric utilities are making that
13 reduce the amount of greenhouse gas emissions from the
14 petroleum industry and attribute it to them. And then what
15 does this do to our high-level metrics for energy
16 efficiency when we're actually requiring the utilities to
17 use more electricity, but to reduce greenhouse gas
18 emissions?

19 So how do we begin to get out the overall
20 frameworks that we use for declaring success on these high
21 level and very central policy goals here in the state?

22 MS. CHOI: I think we have to look at things
23 differently as you just indicated. And certainly, for
24 instance if the utility -- if you think about the utility
25 helping to move a vehicle from gasoline to electricity.

1 And think of it as an energy efficiency program, right? So
2 what is the energy efficiency improvement that you're
3 getting from shifting from gasoline to electricity, and
4 measuring that efficiency improvement? Then it can work
5 just like other energy efficiency programs that the
6 Commission has authorized. It's just like a refrigerator
7 getting more efficient or an appliance being more
8 efficient. You've taken something, in this case a car, and
9 made it more efficient by shifting it to electricity.

10 In terms of how you measure that, you can measure
11 then the greenhouse gas impact. And we can reflect that in
12 our innovative resource plans that we file at the
13 Commission.

14 And I certainly think as we think about how it
15 fits in, in the overall say Cap and Trade Program, we were
16 certainly talking to Air Resources Board about the
17 allocation of allowances that would reflect the
18 electrification of the transportation sector and the
19 benefit that it provides.

20 MR. MALNIGHT: Yeah, I would only add I mean I
21 agree. It requires different thinking, but it's not an
22 unsolvable problem. I think it requires a high degree of
23 collaboration between carbon regulation in the state and
24 our IRP process. But I actually feel like the IRP process
25 really is set up to address that kind of a question. What

1 are the goals and objectives that we want to holistically
2 deliver across the energy system?

3 Electrification can be a good one and we can deal
4 with that in the whole process of the IRP to assess the
5 impact that the electric sector on the state's carbon
6 emissions. I think that's a right kind of forum. We need
7 to make sure that forum is looking holistically at all of
8 the impacts across the state.

9 PRESIDENT PICKER: I'm sorry, I moved on real
10 quickly. I didn't let you have a chance to address my
11 first question about this issue of a moral hazard between
12 the electric and a gas commodity.

13 MR. MALNIGHT: Yeah, I mean I agree with Dan. I
14 don't think that that is inherently a conflict today,
15 because frankly there are many questions about exactly how
16 we're going to achieve the carbon reduction goals going
17 forward. And what the best paths are.

18 I think it's clear that natural gas has to
19 deliver solutions to help achieve carbon reductions, to
20 move forward. But it's also going to be a system that's
21 needed and required in the state for many years to come, in
22 order to help enable that transition. So I don't think
23 there's an inherent conflict.

24 I will say PG&E is a little different. We have
25 the management of both commodities within one utility, but

1 we look at each commodity independently. And ask ourselves
2 the critical question of how are we going to -- what are
3 our business strategies to align to achieve the state's
4 carbon goals over time? We recognize the issues that the
5 gas business needs to continue to deliver. And as Dan
6 said, I think there are solutions that are in front of us
7 and we need to continue to talk about them as we go
8 forward. But I don't think there's an inherent conflict,
9 because they're both together.

10 PRESIDENT PICKER: So, you know, having laid out
11 this significant challenge of clean electricity displacing
12 market share for a large industry, the gas industry. And
13 then another much larger industry, the petroleum, both of
14 which have fairly strong imperatives to maintain their
15 market share, do you think there's a scalability to
16 actually withstand the pushback? You know, internally and
17 externally, if in fact there is a issue where one half of
18 the combined utility believes that the right answer is
19 clean electricity. And the other is gas, how do you deal
20 with that?

21 But for all three of you, how do you see this
22 coming competition with the petroleum industry for share of
23 transportation fueling?

24 MR. SKOPEC: Well, let me take the second
25 question first. I mean, I think all three of us have

1 stepped up and said we're willing to do our part to help
2 electrify the transportation sector. Now, the pace of that
3 is the question and we've got proceedings before the Public
4 Utilities Commission that are going to help determine that
5 pace.

6 We know that the state wants to move in this
7 direction, the state's going to have to do a lot of work on
8 the automobile side to get people in those cars. We stand
9 here ready and willing to provide the charging necessary to
10 charge those cars. I don't know that we see it as it's our
11 job to slay the oil industry. It's our job to provide the
12 infrastructure that our customers want and need.

13 PRESIDENT PICKER: Does he speak for you?

14 MS. CHOI: Well, I mean I agree with what Dan
15 said. I do think it isn't our job to slay the petroleum
16 industry, but I also think we have a goal here in the state
17 that we are strongly in support of. And to achieve that
18 goal is going to take greater electrification. And that
19 electrification needs infrastructure to ensure that it's
20 there for the customers as they adopt those technologies.

21 Anyways, we are certainly not conflicted. We
22 believe that electrification has a great future here in the
23 state. There's a lot of opportunity in the transportation
24 sector, not just in the light-duty vehicle space, but
25 across the board. And we are seeing these developments

1 happen with large OEMs, your traditional OEMs, equipment
2 manufacturers, in this space. And so we're very optimistic
3 about what the chances are.

4 And I think the market then will show that if you
5 have affordable electricity rates, that you can fuel your
6 vehicle at a lower cost than it costs for your petroleum
7 product, we're going to come out a winner.

8 MR. MALNIGHT: Yeah, I think I'm just going to
9 continue to emphasize what these guys have said. I think
10 that all the utilities are clearly committed to the vital
11 need to help electrify the transportation sector in order
12 to achieve the state's greenhouse gas goals.

13 We all see that as a clear opportunity to use a
14 very clean system today with a robust network that's
15 already built and available, but just needs that last piece
16 to enable charging. We stand ready to do that. I agree, I
17 like the way Dan articulated this. I mean, it's not -- we
18 don't approach this from the standpoint of saying we're
19 trying to displace the entire petroleum industry.

20 I think our point is we're trying to make sure
21 that this system stands ready to deliver what customers
22 need and want. And we see a clear imperative from the
23 state and from customers frankly, to move more to clean
24 vehicles.

25 MS. CHOI: I would just add though, that

1 certainly one of the things that's been a barrier to
2 adoption of vehicles is awareness of vehicles. And so we
3 believe that part of the role of the utility is to help
4 with improving that awareness of vehicles without the range
5 of these vehicles. And then having the availability of the
6 charging, so that the range anxiety that we hear so much
7 about is also reduced. And so people get into these
8 vehicles.

9 COMMISSIONER PETERMAN: So let me ask a related
10 question that really gets to IOU ownership of assets as we
11 move forward. So we started the discussion talking about
12 end level setting the point that the IOUs are not generally
13 owning generation and not earning a return on it. That
14 being said, the IOUs have elected to -- and been supportive
15 of over the last couple of years -- ownership of some of
16 the new emerging technology assets such as electric vehicle
17 charging and energy storage.

18 And so I'd appreciate hearing from you, how
19 you're thinking about this question about which assets the
20 utility will own, include a prior (phonetic) rate base,
21 because you also have at times elected different models.
22 And Ms. Choi talked about going forward, the end game is
23 unlikely a wires only company given some of the broader
24 state goals. But I wanted to delve into that a bit more in
25 terms of, if not just a wires only company then what other

1 assets would you like to be owning at the end of the day?

2 MR. SKOPEC: Well, to touch on your first
3 question how do we think about it, we start with the
4 premise we're here to serve all customers. We're also here
5 to implement public policy, and so to the extent that
6 public policy wants to see more electric vehicles, they
7 need to see the charging, we want to be able to provide
8 that. We think that with our service territory, with our
9 engineering capability, with our rate structure we can
10 provide that as good as anyone.

11 Certainly, there comes a point where competition
12 should and can be introduced. On the wholesale generation
13 side, that competition took place after decades and decades
14 of utilities building generation. And then technological
15 innovations coming along that allowed third parties to
16 build that generation more competitively than utilities,
17 quite frankly. And so it took a long period of time to get
18 to that point where we could do wholesale generation
19 competition adequately. I think with brand-new markets
20 that's a lot harder.

21 And I think the PUC tried it with electric
22 vehicle charging. They tried a model where the utilities
23 didn't have a role and third parties stood before you many
24 times and said, "We're ready and willing to do that." And
25 unfortunately, all but maybe one or two of those companies

1 are bankrupt now.

2 So if we need to get this started, and we want to
3 make sure that it's ubiquitous and we want to make sure
4 that it's in disadvantaged communities then you're going to
5 need the provider that serves all customers to do it.
6 That's us. At some point in the future that could change
7 and you could say, "You know what? We don't think that we
8 need the utility in that business. We want you to sell off
9 those assets." Just like you did -- not you, but the
10 Legislature did in the late 1990s with our generation.

11 Batteries is another example, there's a lot of
12 different ways to deploy batteries. You know, you hear a
13 lot about solar in storage, batteries in a garage,
14 batteries behind the meter. And that's one deployment of
15 batteries. We're deploying batteries in our distribution
16 system and our transmission system that benefits all
17 customers.

18 Is one model better than the other? Not
19 necessarily, both are necessary. So I think in the early
20 days it helps to have the large capital and the large
21 infrastructure to invest in those technologies and have
22 them spread out to all customers. But when the
23 technologies get to a certain maturity, I think you can
24 start to open up to competition.

25 MR. MALNIGHT: Yeah, I agree with Dan. I think

1 our objective is to own assets when the utility is the
2 right owner of the assets, when we felt that the utility is
3 the right owner of the assets.

4 And I think that is probably different over time,
5 as technologies emerge, as markets evolve and markets
6 emerge. And Dan said, generation's a great example. Over
7 the long time horizon of where utilities were the obvious
8 owner to where maybe we're not anymore. And I think you
9 see how the market has evolved there. I think if we're
10 wildly successful in batteries and other kinds of new
11 technology, you probably will see a similar evolution.

12 But I do think it's important to go where Dan
13 was, right? We own the assets that drive benefits to all
14 of our customers and to the system. And when the utility
15 is best positioned to own those assets I think it makes the
16 most sense. I expect we will have many conversations with
17 the Commission over time about when is that really the most
18 appropriate for the utility? And the answer will change
19 with time.

20 One thing to note though, and I think you
21 mentioned that the utilities aren't involved in the
22 generation side. But one of the benefits of having a large
23 asset base and a large balance sheet is that we are
24 involved. We don't make money on it, but we're the
25 counterparty to a contract. And when a counterparty is

1 thinking about investing billions of dollars over many
2 years, they really are counting on a creditworthy
3 counterpart they can count on to deliver those returns over
4 time.

5 And I think that's a vital role that the
6 utilities play. It doesn't mean we have to play it, but
7 you have to have that kind of credit quality to drive that
8 capital.

9 COMMISSIONER PETERMAN: Thank you, good point.

10 MS. CHOI: I guess I would just add that I think
11 we've talked about the fact that it may not just be a wires
12 company, but maybe still remain in a procurement role and
13 that sort of thing. But also with respect to utility owned
14 assets again I agree with Dan and Steve that it is where it
15 makes sense and that can shift over time.

16 Certainly, as we think about the future and the
17 planning and operation of the distribution grid,
18 particularly as you have distribution markets that may
19 evolve and come into place, that the role of the
20 distribution system operator then changes. And to maintain
21 the reliability of distribution grid it may be that there
22 are times when it is necessary or useful for the utility to
23 own some of those assets in order to maintain the
24 reliability of the grid and power quality.

25 COMMISSIONER RANDOLPH: So this discussion is

1 kind of wires plus, right? It's like you're providing this
2 distribution and you're owning some assets. And to Steve's
3 point about what is the compensation model for that, can
4 you guys talk a little bit more about some of the ideas
5 that if we assume there's an interest in moving away from
6 volume-metric rates and dealing with sort of how the
7 compensation would go forward? I'm curious.

8 MR. MALNIGHT: Yeah, I think a couple of things I
9 would just say. First, we have to draw a distinction
10 between rate design and compensation models. Because our
11 compensation model is really cost of service rate making
12 and return on a rate base. That's what determines the
13 amount of profit effectively the utility should earn for
14 its investment. Rate design really is a question of how we
15 best allocate that to customers. How we allocate the
16 appropriate pricing signals, cost signals to customers, so
17 those two can be somewhat different.

18 I think the key question for us today is the
19 utilities' compensation model, the utilities' business
20 model is fundamentally premised on the idea that we make
21 money when we invest capital. We build assets. As Dan
22 mentioned, there's a substantial need to drive capital
23 investment in the state over time. That may be a model
24 that serves us well over time, it may be that at some point
25 we say we need to revisit whether we want to encourage the

1 utilities just to only earn when they invest capital. I'd
2 say there's many different models for that.

3 Frankly, we made that change in the procurement
4 system where we effectively took away the compensation
5 model for utilities to do procurement, but kept the
6 utilities in that business. We could actually have the
7 utilities not make compensation just on an assets, but be
8 compensated based on making the best choices for how to run
9 the distribution system, the outcomes of the distribution
10 system, the reliability and the safety of the distribution
11 system. There's lots of ways we can do that through
12 performance-based ratemaking or other things.

13 I think it all starts as I said from before with
14 clear goals and objectives for what we want the electric
15 system to do and then you want to incent all the players to
16 take the right actions to deliver on those goals.

17 COMMISSIONER RANDOLPH: Thank you.

18 PRESIDENT PICKER: I want to go back to this
19 question of the ability to stand behind fairly hefty
20 expenditures and credit worthiness. Are you suggesting
21 that we ought to stress test all of the different LOCs to
22 see whether they actually will be able to achieve the goals
23 that we have for them within their areas of interest and
24 service?

25 MR. MALNIGHT: I wasn't necessarily suggesting we

1 needed a stress test. I think the market stress tests us
2 all every day. You know, the market is usually dependent
3 on two counter-parties coming together and agreeing on
4 terms, right? So if entities are willing to invest on
5 contracts then that's a good signal from the marketplace
6 about the creditworthiness of that company.

7 PRESIDENT PICKER: No, but there is this implied
8 issue of scaling that it requires. That there's some level
9 of scale that's going to be required to meet the challenges
10 of the future and do we want to allow people to enter into
11 the pool to actually supply that investment and those
12 services when they may be more risky than others? So do we
13 want to actually try to set some level of creditworthiness,
14 so that we don't all of a sudden have failures and the
15 Legislature has to really suddenly back track and start to
16 send things back to an earlier stage?

17 MR. SKOPEC: It's a good question and I'm really
18 glad you're asking that question now, because you're right.
19 Once you kind of open this up it's really hard to put it
20 back. We've done that once before and it was messy and it
21 resulted in a lot of costs.

22 PRESIDENT PICKER: I don't think we're opening it
23 up, it's open. It's going there.

24 MR. SKOPEC: Okay. I'm not going to tell you
25 what the best way to stress test it is, but I just want to

1 share an experience to give you a sense of the importance
2 of this. So sometimes I get the pleasure of talking to our
3 investors. And in every single case where I've met with
4 our investors AB 57 comes up whether it's we talk about it
5 or we talk about it. Now, how many people remember AB 57?
6 Maybe not a lot. AB 57 was a law that came out of the
7 energy crisis that gave the market assurance that when the
8 utilities entered into long-term contracts and the PUC
9 approved them, that they would get rate recovery.

10 So of all the things that our investors want to
11 hear about, and they want to hear about a lot of things
12 that we're doing, they always want to know that you're
13 going to get that recovery. And by the way, they mention
14 AB 57 when they talk about the strength of the California
15 regulatory environment. So no one walks around anymore
16 talking about AB 57, but our investors do.

17 And this goes to the point that you're making,
18 Chairman Picker, how are you going to ensure that the
19 investors have the same confidence in all these new players
20 that they have in us, that you granted us by implementing
21 that law?

22 MR. MALNIGHT: Yeah, I think Dan that's a great
23 point. I think it's important as we go through this to
24 just make sure that we're considering the unintended
25 consequences with different alternatives that we may see.

1 You know, as I mentioned before much of the regulatory
2 construct and design around community choice aggregators as
3 an example, I feel is really designed when they were a
4 relatively small portion of load.

5 As we ask ourselves do we have all the right
6 structures in place if community choice aggregators or
7 direct access providers are providing up to 80 percent of
8 the load? Are we confident that there is the sufficient
9 structures in place to attract the capital that we need to
10 make those investments? I think those are things we have
11 to study as we consider this alternative. I'm not sure I'd
12 have a suggestion today for the magic test that we should
13 apply, but they should certainly be considered.

14 CHAIRMAN WEISENMILLER: Oh yeah, well just
15 following up on that point for a second. You know, Marcel
16 showed the chart of the ESPs vaporizing back during the
17 crisis. And a lot of those folks got into this business
18 when there was excess supply in the late 90s. And suddenly
19 when we got to a crisis, I mean god bless PG&E went into
20 bankruptcy and Edison was certainly on the edge of
21 bankruptcy. So the fact the ESPs, which were going to be
22 capitalized shell companies going like that, like a
23 snowflake in Sacramento in August, is not a big surprise.

24 But this is an easy time to be in a the power
25 business, but it is a pretty brutal business that can flip

1 on people. So again, how do we prepare ourselves for that
2 type of contingency?

3 COMMISSIONER PETERMAN: I don't have an answer.
4 (Laughter.) I do have another question, but does anyone
5 else have an answer?

6 MR. MALNIGHT: I don't have the answer either
7 except to just say I think it's the right question to ask
8 and it's the right question to make sure we have a strong
9 answer on before we go too much further.

10 PRESIDENT PICKER: Oh, you weren't suggesting
11 that, but I got there somehow. I don't know.

12 COMMISSIONER PETERMAN: So my question is, it
13 sounds like you're in general agreement and other parties
14 as well, that the first or one of the first things that we
15 have to address is exit fees. What's the second from your
16 perspective?

17 MR. SKOPEC: Well, I don't know if it's just the
18 second. I mean, there's the second and the third and the
19 fourth. I mean, so I do think that you have to make clear
20 the planning part as we talked about. You know, who does
21 the new build, who's going to have that responsibility?
22 And I think that has to go in conjunction with, as I talked
23 about earlier the procurement models, which you're doing
24 right now with the IRP. But we'd have to again address
25 this question, do you have the authority over all of these

1 potentially new entities.

2 So I think that the planning and the procurement
3 process, and the authority for that procurement process
4 probably has to be addressed together soon after you figure
5 out the exit fees.

6 MR. MALNIGHT: I guess I would just suggest, I
7 think the next order of business as I sort of mention in my
8 remarks I believe, is we have to get very clear on our
9 priorities and what we want to accomplish, what we're
10 willing to trade, and what we're not. And what we're
11 willing to make sure that as a state we're going to stay
12 strongly committed to. Because no matter what answer we
13 have or no matter what answer we decide to pursue, that
14 commitment is what's vital. That commitment is what
15 provides market actors some sense of predictability on the
16 marketplace.

17 So for example, in a Texas kind of model there's
18 a strong commitment to let the markets resolve capacity
19 needs for the future. The markets will provide the types
20 of resources that are going to get billed. If you're not
21 committed to that and you come in later and say, "I'm going
22 to now apply a mandate, because I'm not really comfortable
23 with high market prices driving capacity editions," you
24 kind of undermine the whole model. So I think it's
25 important upfront that we know what we're committed to and

1 what we're going to stick to throughout.

2 And then from there you go to planning models,
3 pricing models, and I think we can all come to a conclusion
4 about what's right for California.

5 COMMISSIONER MCALLISTER: I want to get back to
6 Commissioner Peterman's question about what you anticipate
7 might go into the rate base. So I think there's a wide
8 variety of ways we're going to get to our reliability goals
9 and our carbon goals. Some of them cost more than others
10 and I guess I'm wondering, at this juncture what do you --
11 do you think there is an undue incentive to invest in
12 hardware that builds the rate base versus looking for other
13 kinds of solutions to this? You make money on the rate
14 base, so do you --

15 MR. MALNIGHT: Yeah.

16 COMMISSIONER MCALLISTER: -- so these
17 investments, are you going to tend towards bringing a big
18 storage, a big charging, all that kind of stuff versus
19 looking for portfolio, some of which is more on the
20 procurement side versus the rate base?

21 MR. MALNIGHT: So I would just say I think
22 there's counter, as a utility there's always countervailing
23 forces that balance the incentives we currently have to
24 invest in rate base. And one of the primary ones I would
25 acknowledge is affordability for our customers.

1 So at the end of the day all the revenue that's
2 collected, goes out to our customers in the form of a bill
3 that has a PG&E logo on top. And as a company our
4 objective is to drive long-term sustainability for the
5 business and to grow going forward. So affordability is
6 always an effective counterbalance. We already have an
7 incentive today if we're considering an investment decision
8 to look at all the sources that could meet that need
9 including ones that wouldn't be a utility owned asset.

10 We've actually run pilots already in our system
11 looking at deploying our existing energy efficiency
12 programs and demand response programs to potentially offset
13 the need to invest capital and substation capacity. Those
14 things are there, because the opportunities to invest, you
15 know, it really just shifts us to a different place to
16 invest those assets. It allows us to deliver more benefit
17 to customers for the same price. It doesn't necessarily
18 mean our business is suddenly not an attractive place for
19 us to invest.

20 So I think those counterbalancing forces are here
21 today and at the same time we're regulated by the
22 California Public Utilities Commission, that continually
23 looks at the decisions, the investment decisions we're
24 making. And can provide that kind of oversight. I don't
25 think that tension that you mentioned at all inhibits our

1 ability to do innovative and new things.

2 MS. CHOI: Yeah, I would agree with that. And
3 certainly, in our latest GRC that's before the Commission
4 today we actually proposed a deferral project, so where we
5 could see the testing the idea of utilizing distributed
6 energy resources to defer traditional utility investment.
7 I would say we're in the early days of knowing whether they
8 can be utilized for a grid asset. And what we do have is
9 knowledge of how utility assets perform, the transformers
10 and wires that we've relied upon for the last 130 years.

11 And so one of the things we talked about in our
12 distribution resources plan in using distributed energy
13 resources as a grid asset, is that availability. The
14 dependability and the durability of those resources on the
15 Grid, so we're not going to do a 20-year pilot. We're
16 going to start moving forward and utilizing those resources
17 where we see an opportunity and at a cost that helps
18 benefit the overall customer.

19 PRESIDENT PICKER: So, we're at our deadline
20 here. Is there anything you'd like to say, Mr. Orans?

21 MR. ORANS: I'd like to respond just a little bit
22 more to Commissioner Peterman's question, because I was
23 taking notes during this whole thing. I think I
24 summarized, I tried to make a list, anybody correct me if
25 you think this is wrong.

1 I think there were four -- and I don't know if
2 this is the order, but this is the way I wrote them down --
3 so rather than just call it exit fee, I think it's kind of
4 a coming and going rule. And the coming and going rule is
5 really critical for two things: financing and planning. If
6 you don't have the coming and going rule neither side can
7 figure out the financing or the planning and none of that
8 stuff will get done.

9 And I think this provider of last resource also
10 was a big discussion. So those are two, I don't know what
11 ones are first.

12 And then the third one, I think and I'm going to
13 call these two together, they might two separate: rate
14 design/functional unbundling. They're functional
15 unbundling of cost in the monopoly services, so that we
16 know which ones are variable and which ones are fixed,
17 which ones are non-bypassable charges. I think that's teed
18 up really nicely in the staff whitepaper.

19 But those three or those four, Commissioner
20 Peterman, I thought were all mentioned in the utility
21 presentation.

22 PRESIDENT PICKER: Okay. Thank you.

23 And we're going to take another 15-minute break.
24 We're in the end stretch here, so I hope we'll see you all
25 back.

1 (Off the record at 3:02 p.m.)

2 (On the record at 3:21 p.m.)

3 PRESIDENT PICKER: Ken and folks are having a lot
4 of productive discussions in the hallways and the
5 alleyways, but we need to keep on schedule here. You know,
6 the beer starts to flow right at 5:00 o'clock.

7 Mike? Mike Day? Mike Day, take your seat and
8 take a couple of people with you.

9 CHAIRMAN WEISENMILLER: Come on, either sit down
10 or get out of the room, but we're going to roll.

11 PRESIDENT PICKER: Okay. So I'm going to turn it
12 over to Jan Smutney-Jones who is going to lead this next
13 panel of illustrious speakers, some of whom we've already
14 heard from. But who will actually be telling us what they
15 really think.

16 MR. SMUTNEY-JONES: You may not want -- thank you
17 very much, I'm Jan Smutney-Jones. And I'm with the
18 apparently the Legacy Cost Association based on previous
19 conversations. But I wanted just to (mic cuts out) --
20 California's current regulatory framework, I think portions
21 of which developed under circumstances that no longer
22 persist, it is ill-suited to govern today's electrical
23 services industry. And the Commission went on to say the
24 state's current regulatory approach is incompatible with
25 industry structure likely to emerge in the ensuing decades.

1 Now, these words of wisdom were uttered in April
2 of 1993 in the so-called Yellow Book that led to the
3 original restructuring. Now, I think it's important to
4 remember that, because there is a pretty long history here
5 to be remembered. I sort of feel like I'm Rip Van Winkle.
6 I fell asleep listening to conversation about choice is
7 good, embedded costs need to be recovered, and who pays for
8 a future investment in the Grid. I wake up 25 years later
9 and these same issues are back with us, so I think that
10 there are some things here that are not new at all.

11 And there are some issues that are actually much
12 more complicated. We do have technology. We do have
13 innovation. There are more players now talking with
14 respect to this customer choice market than there were back
15 in the mid-90s. But I think when we started out this
16 morning, Commissioner Weisenmiller indicated that the
17 primary responsibility for the Commissions here, both of
18 you, are reliability for all customers and access to
19 electrical services at affordable costs.

20 And that was followed by President Picker, that
21 the problem we have right now is there does not appear to
22 be any coherent plan in terms of how we pay for those costs
23 going forward and frankly how we continue to pay for the
24 costs we have in place. We are sort victims of our own
25 success. I don't think anybody -- I started doing solar

1 work back in literally 1980. I don't think anybody foresaw
2 at that time we would have 10,000 megawatts of utility-
3 scale solar and another 5,000 on the roof. And we have a
4 wind resource that is currently providing about one-third
5 of the RPS required.

6 So this has been a great success, but those are
7 embedded costs and most of those secured under contract.
8 And I'm sure you'll be shocked to know that we expect that
9 those contracts will be honored, so when we get into a
10 discussion that somehow these may be threatened by a new,
11 more robust model we get a little concerned.

12 You know, going forward we have a similar
13 problem. In order to meet -- we have all these resources,
14 but we have an afternoon ramp that's currently met with gas
15 resources, frankly. That's most of what we use for the
16 ramp. That's about 120,000 GWh a year, sixth largest
17 economy, accounts for about 1 percent of the criteria
18 pollutants. So it is a relatively clean system, and again
19 it was built to provide reliable service, clean service to
20 the people of California.

21 So going forward, what does that look like?
22 Those gas plants are eventually going to start coming off,
23 offline. We've obviously got the once-through cooling
24 plants, but what does the market structure look like that's
25 going to be able to roll in DER storage to provide those

1 reliable services? And most importantly, what is that
2 actually going to look like? Who is ultimately going to be
3 accountable for making sure that everybody's got sufficient
4 resources to keep the lights on?

5 And so these are all big issues. The simple fact
6 of the matter is there's a lot of talk about innovation
7 here driving this issue and that may be true. That may be
8 a big part of it, but I also think it's rate making,
9 frankly. That's what drove NEM. That's what's driving in
10 large part community choice. So I think all of this again,
11 is bringing forward a number of issues that we had a
12 struggle with 25 years ago. There's lessons to be learned
13 there.

14 I'm going to let the rest of the panel talk, and
15 I may have a couple of closing comments just in terms of
16 trying to pull some of that together. But at any rate,
17 we've got a great panel here of people who are seasoned
18 experts at this. I've just asked each one of them, when
19 they speak, to introduce themselves because I think there's
20 some people who are probably listening to this on the Web
21 who won't necessarily recognize their voice.

22 So with that, I'm going to start with Sue
23 Tierney.

24 MS. TIERNEY: Good afternoon, as I mentioned
25 earlier I'm Sue Tierney from Analysis Group. I was a

1 Commissioner in Massachusetts at the time restructuring was
2 being anticipated. I was at the Energy Office, before that
3 involved with long-term plans and was at the Department of
4 Energy. So for about half of my career I have been in
5 state and federal government and have now been a consultant
6 for many years working on a number of the issues that you
7 are pondering. Pondering and being hit with a fire hose to
8 deal with.

9 So I want to make five points. The first one,
10 thankfully has already been made by many people today and
11 that is that this is truly déjà vu. The combination of
12 high prices and technological change really enabled people
13 to start leaving the system effectively, 20-25 years ago.
14 And those were large industrial customers. It's some of
15 the same kind of things that you have been talking about.
16 So there was motive and opportunity for introducing the
17 concept of choice.

18 Number two, what happened at that eve in which
19 technology and economics were pushing for change? Of
20 course, we know at the wholesale market level there had
21 been a number of things going on to open up transmission
22 access on utility systems on a nondiscriminatory basis.
23 There was early RTO formation in a number of parts of the
24 country. There was generation competition. There was the
25 unbundling of rates that we've just heard about today. And

1 at the retail level, 14 jurisdictions, 13 states and the
2 District of Columbia now have retail access.

3 Many, many more have of course the kind of retail
4 choices that we've been talking about today associated with
5 being able to opt out on different technologies and have
6 some other thing besides a utility's plug providing juice
7 to a customer. But these 14 jurisdictions are principally
8 wires companies, wires only companies, although that's not
9 the only way that they've been restructured. And some of
10 them have wires and generation service. Each part of the
11 country that has opened up for retail choice addresses
12 resource adequacy in a little bit different way. And very
13 different than California, in fact.

14 And so these many designs, I am going to draw
15 from those many designs of introducing choice and
16 competition to tell you a couple of things that I think
17 went well, and things that I think less well across the
18 other states that have been doing it. I'm not going to
19 tell you about California, you know that way better than I
20 do.

21 So what worked pretty well eventually? POLR
22 service, pretty much everybody has been able to get access
23 to electricity. The lights have stayed on except in
24 California during your famous period of time. One of the
25 things that worked well was addressing legacy costs. Of

1 course, we used to call them stranded costs, but things are
2 different here. And so having that be done and addressed
3 and people could move on beyond that was a very effective
4 thing. Those are collected through nondeposit by
5 (indiscernible) bulk charges and they had to deal with a
6 lot of very tricky cost allocation questions. You know
7 those very well.

8 It's also worked well, there has been
9 nondiscriminatory access to the wires for the most part.
10 Lots of investment early on, especially in electricity
11 generation infrastructure. People have had the ability to
12 switch and now about three-quarters of the load that is
13 eligible to switch has switched at some point and time over
14 this period. Lots of competitive suppliers and finally,
15 the last thing I'll mention is that in the states with
16 retail choice, security constrained economic dispatch has
17 been a real jewel in making sure that there is a liquid
18 market.

19 So what hasn't worked quite so well? The states
20 that did a package that was trying to deal with the
21 different elements at once, I think had a better chance
22 than the bolt-on strategy, who said bolting things on to
23 existing structures and evolving piece meal. Early on
24 public education about customer options was not that great
25 across the states. Texas is the one that I think really

1 did a good job on customer education, because everybody had
2 to choose a supplier rather than stay with the incumbent.

3 Third, lining price signals between the
4 wholesale. What we know about pricing and the wholesale
5 level and then what customers see in their bills, that has
6 not worked that well in very many places. And so there's a
7 big gap still today between the signals and incentives that
8 are being sent by retail rates.

9 There has not been a great development of
10 products in wholesale markets associated with CO2 and
11 people are struggling with that now. I think that there
12 has been political fatigue every time -- or let's see --
13 fatigue with the choices made about the design of the
14 market structure whenever price volatility has hit. And
15 there's always a finger pointed that that was caused by
16 competition, except in Texas of course, to a lesser degree.

17 Finally, the last thing I'd say on what worked
18 less well as an observation is that the states that started
19 on the competition horse, including retail choice, I think
20 said they wanted to live with market outcomes. And now,
21 fast forward to this time today, they're not so excited
22 with what the market rendered. And that's because of a
23 number of the things that I said.

24 And so let me just say looking ahead, I'm going
25 to just tell you just a minute about Massachusetts.

1 Massachusetts was a state that went a wires only, the
2 divestiture of all generation, set up a regional six-state
3 RTO market. And there was a very strong commitment to
4 relying on markets for a variety of things: reliability,
5 generation mix, etcetera.

6 There is not impatience in Massachusetts or the
7 other New England states with what the markets have
8 wrought. The markets have wrought natural gas generation
9 and renewables driven through short-term REC agreements and
10 Massachusetts is making its way on satisfying its RPS
11 requirements. But there is a real concern that they're not
12 moving fast enough given the long-term greenhouse gas
13 emission goals. So they, like you, in that state have an
14 80 percent reduction target by 2050.

15 You're probably even beyond that, but they're not
16 seeing how they're going to get there without long-term
17 contracts. And what do you know, they're going to the
18 utilities mandatory long-term contracting by the electric
19 utilities for offshore wind, for hydroelectric power from
20 Canada. There will be above-market costs. They will be
21 put on non-bypassable charges. So generation is coming on
22 to the wires charges as a deliberate matter of policy
23 choice. And they will be facing all of the things that
24 you're facing and they'll probably be watching you, because
25 you're starting almost at the other end of that. You have

1 long-term contracting procurement and now they're starting
2 that after having ridden the full retail access wires only
3 choices.

4 Let me stop there and I'm really looking forward
5 to answering any questions.

6 MR. SMUTNEY-JONES: Ren?

7 MR. ORANS: Sorry, my name is Ren Orans and I'm
8 Managing Partner of E3. I have three points and a couple
9 of slides. And these three points are all wrapped around
10 three years ago my oldest son, after graduating from
11 college he came to my wife and I and he said, "I'm going to
12 an Ashram in India. And he's been there for three years
13 and we've been kind of studying some of the stuff he's been
14 looking at. And it's given me a little bit different,
15 longer-term perspective on California energy policy.

16 So the first thing I want to emphasize is this a
17 righteous pathway. So it is something worth doing and I've
18 been in Hawaii, I've been in New York, I've in the UK, I've
19 been in Germany. And a lot of the stuff we are doing is
20 new and innovative and creative and so we need to hold on,
21 when you think about the restructuring make sure all those
22 things you can kind of hold on and keep it together.

23 The second thing is it's hard. And if our key
24 goal is demonstrate then it has to be hard. And so make
25 sure when we put together, as Sue said, this new model --

1 and I do think we need a new model -- that it still
2 demonstrates leadership. But it's also perhaps more
3 applicable to other jurisdictions than only California, so
4 it's more spreadable and more transparent.

5 The third one, I think is it's got to be more
6 middle path from command and control and market. So it's
7 going to have some of those. It's going to be, I don't
8 know -- I think it was Caroline who said we have a hybrid
9 market, we're going to end up with a hybrid market. She
10 outlined some of the two bookends, but I think somewhere in
11 the middle is a mix of things that California could go
12 forward with.

13 And I have a couple of slides that I thought -- I
14 don't need to go through these, because I think the Utility
15 did a nice job at covering these. These were -- if Utility
16 didn't answer these questions, I was going to fill in some
17 of the details I thought behind them. But they've covered
18 the majority of what I think are the challenges here on the
19 scorecard. And I've talked a little bit to Nick Chaset
20 about this. I think thinking about that OIR as a roadmap
21 is a useful concept rather than -- and I think it was you
22 Commissioner Peterman who said, "What's first, what's
23 second and what's third?" And maybe even what are the
24 triggering events that push you from one to the next. And
25 we're already at -- and President Picker, you said we're

1 already at a bunch of those things already, so we have to
2 deal with them. Some of them are legacy. Some of them are
3 right in front of you. What's three years? What's five
4 years and what's after?

5 And I think using the pathway data to look at
6 that and ask ourselves how are they going to get done is a
7 nice way to frame all of that. So that's one concept.

8 The other one is -- and I don't want to go
9 through all this -- but we've spending a lot of time in New
10 York trying to figure out really what Audrey was on to
11 initially in REV. And I think she had a number of really
12 strong points. And the first one is, and all I did in this
13 one -- and this applies to California, it applies to
14 Hawaii, it applies to New York, it applies to the UK. So
15 all places that are aggressive energy policy and doing lots
16 of stuff and by the way, the UK has more DER than we do.
17 They have more distributed solar that the national Grid
18 can't see than we do, which was just -- you know, it's
19 unbelievable.

20 So if you look at this, just on the bottom of the
21 thing is a DER market. And we're going to have a growing
22 rich DER market. Whether we like it or not it's technology
23 driven. It's customer choice driven. It's going to get
24 bigger. So anything you build next will have to basically
25 deal with a growing rich DER market. That's a good thing,

1 but it's going to have to accommodate it. And that DER
2 market, some folks in there are going to want to be able to
3 go directly to the wholesale market. Some DERs will want
4 to go through the utility. Some will want to go through
5 third-party aggregators and they can be direct access or
6 CCAs etcetera.

7 In all of these pathways, the only thing I wanted
8 to make about this diagram is the existing BAU model
9 structure now is extremely complex already. So the issues
10 the utility brought up, I don't want people to view that as
11 bare requirements for any new model, but you already have
12 them in the existing model. You have to rebuild your
13 existing model anyway and all those criteria that Steve
14 brought up at the end, they have re-rebuild into the
15 existing model. And so we're kind of at that phase of
16 rebuild your whole car from the beginning or buy a new car
17 anyway. And start with the existing model, because it has
18 some really good things in it and build on top of it. Not
19 bolt on as Sue said, but a holistic model that works for
20 all of these cases.

21 MR. SMUTNEY-JONES: Jon?

22 MR. WELLINGHOFF: Thank you. Good afternoon,
23 President Picker, Chairman Weisenmiller and Commissioners.
24 I'm Jon Wellinghoff and I'm the Principal in a new
25 consulting firm, Policy/DER.

1 I don't want to come here today and pretend that
2 I can tell you in California what you need to do in the
3 future. I just want to give you some of my experiences of
4 seven-and-a-half years of which was with the FERC, four-
5 and-a-half years as the Chairman of FERC. And what I
6 learned in trying to expand and make efficient the
7 wholesale energy markets in this country over that period
8 of time.

9 And I think the experience there is somewhat
10 transferable although every state has their own unique
11 characteristics and experiences and requirements and
12 policies. We recognize that at FERC and a number of the
13 orders that we issued like Order 1,000 included things like
14 state policy that was to be included in regional
15 transmission planning that your CAISO does here and that
16 the other ISOs do.

17 And then talking about Audrey Zibelman in New
18 York and what she was trying to do there with the REV, I
19 think she was very much informed by what she had done at
20 PJM. She actually ran PJM for awhile, so I think she took
21 that experience and translated it some, so I hope that I
22 can translate some of those experiences to you. And if you
23 have any questions about that we can talk about it and I
24 hope to answer most of your questions that you've got for
25 this en banc panel as well.

1 And then at the end I hope to give you two sort
2 of ideas of things that you might want to consider where
3 you can move forward in two areas that I think could
4 advance the issues of customer choice, because this panel
5 is about customer choice. And we're not going to stop it.
6 It's happening and it's just going to continue to expand,
7 so we need to figure out how to work with it in ways that
8 are constructive and do meet the policy goals of your
9 state.

10 One thing I thought was interesting though that I
11 wrote down here while I was taking notes from the previous
12 panel, the utility panel. One of the gentleman said, "Our
13 investment model is to invest capital," and that's clearly
14 what they do. Although I think that model does conflict,
15 at least we saw at the federal level that it conflicted
16 with what we needed to do with respect to making
17 transmission investments on the Bulk Power System
18 efficient. And as such under orders that went in place
19 before I got to FERC, Orders 888, 889, 890 and then Order
20 2000, FERC of course put in place independent system
21 operators. To ensure that there was an independent
22 operation and planning platform that could break apart the
23 conflict between the investment desire of the transmission
24 owners and the operation and planning on that transmission
25 system.

1 I've written a paper regarding the potential of
2 translating that model down to the distribution level. In
3 fact, I see one of your white papers references my paper
4 when you talk about models, various potential business
5 models for utilities. I'm not necessarily recommending
6 that business model for California, but I do think -- and I
7 think the other thing that was said on the utility panel is
8 that I think you do need to move rapidly to determine what
9 is the most effective business model to meet your goals?
10 And I think that's an essential thing to do.

11 So one of the things we did at FERC in looking at
12 things like distributed energy resources, we were concerned
13 about how to get those into markets. And how to ensure
14 that they could be robust and incentivized in the way of
15 not providing something that they're not entitled to. But
16 ensuring that they are given the appropriate compensation
17 for the value that they provide to the market.

18 And the one quick example I would give you would
19 be Order 755 where we recognize there are certain types of
20 behind-the-meter resources such as batteries, even
21 batteries in electric vehicles. And demand response that
22 could provide something called regulation service, which is
23 the fast response frequency balancing service on the Grid.
24 And we recognized that those resources could do that job
25 better than the traditional utility resource, the

1 combustion turbine. So we put in place an order that said
2 to the ISOs in those markets where you have these resources
3 available to you, you must recognize the value that they
4 provide and compensate them appropriately. And so that was
5 an example of, in essence creating the market by
6 recognizing value.

7 I think you can do the same thing here in
8 California with respect to the array of distributed energy
9 resources that are going in. And I think right now they
10 seem to be going in, in somewhat -- I don't want to say
11 haphazard, but maybe I should -- they seem to be going in,
12 in somewhat of an uncoordinated fashion in the sense that
13 they're not driven by a specific market signal that
14 recognizes how their aggregation collectively could drive
15 for you, value into that market. And so if there are ways
16 to do that, and again I'll suggest a couple of examples, if
17 there's ways to do that I think you ultimately could then
18 provide for competitive providers. Whether it be CCAs that
19 I think are potentially a model that could take this up, or
20 the energy service providers that are providing direct
21 access to certain customers, those entities potentially I
22 think could aggregate for their customers distributed
23 energy resources in an effective way. And provide those
24 values into various markets.

25 And so let me talk about two different examples

1 that I hit upon in doing some research for this panel. One
2 would be the paper that was done by the CEC, I think it was
3 in July of 2016, done by the staff of the CEC. A white
4 paper on the South San Joaquin Valley distributed energy
5 resource deployment area. There was an analysis done,
6 first by a consulting firm Navigant and then a white paper
7 done by the CEC staff that indicated that there was as much
8 as \$300 million to be saved in the South San Joaquin Valley
9 by simply -- not simply, but it is a task there's no
10 question, none of this simple. I never realized how
11 difficult energy policy could be.

12 But ultimately it is something that could be done
13 to defer transmission investments and defer other
14 investments that would be made ultimately in a TPP
15 transmission plan of the ISO that could substitute for
16 those investments. And ultimately allow you to put in
17 distributed energy resources in the community and do it in
18 a very effective way. And this can be done under FERC's
19 Order 1000. In fact, if you look in footnote 563 of that
20 Order it says, "As we stated in the proposed rule, the
21 Commission has recognized that in appropriate circumstances
22 alternative technologies, which would include things like
23 distributed energy resources, may be eligible for treatment
24 as transmission for ratemaking purposes."

25 So ultimately, if you could figure out how to

1 partner with some entity to develop a DER aggregation
2 program that could be bid into the CAISO as an alternative,
3 it could in fact be paid for as a transmission alternative.
4 So you have one revenue stream to do that.

5 And then let me give you the second idea and then
6 I will close up here. The second one would be in Jack
7 London Square, this is at the distribution level and this
8 is not at the transmission level. You wouldn't be using
9 FERC Order 1000. You would, in essence, be using the
10 powers of the CPUC and the authority that you have, to have
11 DERs at Jack London Square substitute for a peaker plant
12 that's been talked about to be retired for a long time.
13 Ultimately to retire it and instead put in DERs that would
14 substitute for it, but you'd have to value those DERs and
15 determine what in fact would be the market payments that
16 would be made.

17 So in conclusion, really what I'm suggesting here
18 is you look at market structures in ways that you can put
19 in place to ensure that these types of resources can be
20 adequately valued and compensated. And if you can do that
21 and figure out which partners you can play with to do that,
22 which business models you set up whether it be for the CCA
23 or whether it be for the ESP or whether it be for the
24 utility that I believe is the way to most effectively get
25 these resources deployed to get to your goals in the state.

1 Thank you.

2 MR. SMUTNEY-JONES: Last but not least ever, is
3 Ralph Cavanagh.

4 MR. CAVANAGH: Mr. President, Chair Weisenmiller,
5 colleagues and Commissioners, I was originally cast on this
6 panel clearly as the unrepentant and unreconstructed
7 skeptic of retail electricity competition. But it turns
8 out that today is about much more than that, in which I
9 rejoice. And I've decided that my principal role at the
10 end is simply to cheer you up. (Laughter.)

11 The fundamental question that is posed by the
12 proceedings today is whether California can sustain its
13 clean energy leadership, its drive to de-carbonization,
14 while ensuring affordability, honoring equity and promoting
15 improved reliability across the system. And my answer is
16 an unreserved yes.

17 And my hope is that you will emerge from today
18 both with that confidence internally and the ability to
19 project it, because the one thing that can hurt us now is
20 regulatory leadership that displays a lack of confidence in
21 the path forward. And we have seen this in the past. And
22 I think my role as your historical memory is to brandish
23 something I can't believe hasn't appeared before now today.
24 It's not -- your staff report is as styled a white paper --
25 it is an extraordinarily constructive contribution to

1 today's conversation. I'm going to be brandishing
2 something with a blue cover, which the Commission to my
3 horror released on Earth Day 1994.

4 And this is what happened a year after the report
5 Smutney read from and this was some of your predecessors in
6 an unrestrained embrace of retail electricity competition.
7 But in something else, which was a fundamental lack of
8 assurance on confidence about the future of regulation.
9 And about the capacity of regulators to do anything more
10 than genuflect before what the Blue Book calls the "genius
11 of the marketplace." In face of concerns that to do other
12 would be to risk being branded as soviet-style central
13 planners. (Laughter.) A term I had not heard at a PUC
14 forum for at least two decades until this morning.

15 It allows me to serve my ritual function of
16 reminding us all that there is a distinction between a
17 soviet style central planner and being a regulator in the
18 public interest, which is emphatically what all of you are.
19 What happened as a result of the Blue Book, the embrace of
20 retail competition and the fundamental lack of regulatory
21 direction on the future of the electric sector, was a
22 collapse of California's investment in electricity
23 procurement and electric system infrastructure. A collapse
24 driven as much as anything else by simple uncertainty among
25 the critical players about what their role should be. And

1 about an uncritical reliance on the genius of the
2 marketplace to do everything that regulated utilities and
3 their partners had done in the preceding decades.

4 We should not risk doing that again, which does
5 not mean that we embrace some kind of all-encompassing
6 monopoly model. That 22 hours after the Blue Book it's a
7 new debate. There is new technology. There are a host of
8 new options and choices. I appear before you as a
9 celebrator of choices, but a continuing skeptic of what has
10 been called retail electricity competition. And by the
11 way, I should make clear I don't think community choice
12 aggregators represent retail electricity competition
13 certainly as it was conceived in the mid-90s.

14 In fact, some of you will remember that community
15 choice aggregation was offered as an alternative to retail
16 competition for the residential sector. And as a way of
17 ensuring that a competent central portfolio manager would
18 remain in place for residential customers if the system
19 completely deregulated on the retail side. I also don't
20 think that rooftop photovoltaics are retail electricity
21 competition. Nor do I think that those who are installing
22 them are issuing some kind of a blanket, no confidence vote
23 in system-wide procurement. Or that they are threatening
24 or intend to disconnect from the electricity Grid.

25 And the other myth of the mid-90s was that a

1 utility death spiral was imminent. That massive de-
2 connection was imminent. That the historic natural
3 monopoly over distribution service and the public interest
4 justification for it was somehow gone. I think we have
5 learned since that that was flat wrong. And one of the
6 tools that you continue to retain, for those investments
7 you think need to be made on behalf of the entire system as
8 Sue Tierney has pointed out, is to continue the practice of
9 assigning charges to distribution on a volume-metric basis.
10 Which no customer bypasses, which appropriately allocate
11 across the system the costs that you determine are
12 appropriate for the system to bear even as you open the way
13 for new forms of choice.

14 But your fundamental tools: the non-bypassable
15 charges, the ability to assign procurement responsibility,
16 the ability to assign cost allocation, the ability to set
17 rate design, they're in your wheelhouse. You still have
18 them. As are your capacity on the Energy Commission to
19 establish energy efficiency standards, your capacity on the
20 PUC to oversee energy efficiency investments, which remain
21 our highest priority resource in California. And which
22 probably deserved even more emphasis than they have
23 received so far today.

24 Where this leaves me is that as you look forward
25 and as you think about what needs to be done next, I

1 encourage you to do a couple of things. First of all, do
2 spend some time looking carefully at the record in other
3 states of retail electricity competition. I've submitted
4 for the record in the manner designated by the President
5 the study I coauthored last year of the record of retail
6 competition over the past decade with special focus on the
7 five states that have had the most experience with it.

8 I want -- and my friend Phil O'Connor who is in
9 this room, although he disagrees with every word of the
10 study was kind enough to review it. What I would say about
11 the findings from my perspective, look at the Texas market
12 carefully in terms of the actual products. Because those
13 who say Texas makes retail competition work need to
14 understand yes, there is robust commodity-based
15 competition. There is promotion of increased electricity
16 use with an efficacy and an eloquence that you can scarcely
17 believe.

18 My favorite products are the all you can eat
19 rate, where you pay based on the size of your house rather
20 than on how much you use. And the special penalty and
21 reward systems where if you don't hit your monthly kilowatt
22 hour consumption target you're docked. And if you beat the
23 target you get a special rebate check. And if you'd like
24 to see products like that in California, if you think that
25 somehow that is consistent with de-carbonization, equity

1 and all of the other values we've been discussing
2 emphatically including electric system reliability, then I
3 guess have it. But I can't believe any one of you wants
4 that.

5 Look carefully at the products that have actually
6 emerged in the retail marketplace. And at the same time,
7 and here's my concluding comment in terms of structure, we
8 talked a lot about resource planning, resource allocation,
9 cost allocation. I submit that in the Commission's IRP
10 process -- and I think I heard Geof from Sonoma Clean
11 Energy acknowledge that he's fully prepared to do this --
12 you're entitled to ask each of the community choice
13 aggregators for their resource plans. They'll give them to
14 you.

15 If you don't think those plans are adequate, if
16 they can't show you that they are meeting the same standard
17 that you are imposing correctly on the utilities, I think
18 you should be directing additional procurement. And
19 charging the customers of the systems that are not
20 providing that procurement themselves.

21 Let me leave you with a final thought as you
22 think about how to frame what we're about here, how to
23 describe the choices going forward. I wanted to quote from
24 Steve Wolens who's a former Texas lawmaker. He was quoted
25 recently in an Energy Wire. He said, "Everybody's become

1 their own taxicab company and everybody's become their own
2 hotel. And it's just incredible what's happened and now
3 everybody's going to become their own utility."

4 And that put me in mind of a similar moment 24
5 years ago right after the Blue Book happened when I was in
6 a debate with the retail competition enthusiast who said
7 everybody's going to become their own utility. And I said,
8 "Oh, come on. What's in that for my mother?" And he was
9 ready for that question and his response was, "For the
10 first time in history your mother's going to be able to
11 hedge her own fuel price risks in the marketplace."

12 (Laughter.)

13 And if, as I hope that response generates a smile
14 today, because at the time it generated -- it was widely
15 felt he had scored a telling point. If it cracks a smile
16 today let's be sure we don't make that mistake again, even
17 as yes we embrace all of the positive aspects of the
18 improved choices, the improved technology. And the vital
19 importance of linking all the parties who have testified
20 today as partners going forward in a clean energy future,
21 not as antagonists and adversaries. Thank you.

22 MR. SMUTNEY-JONES: Thank you, Comrade. I think
23 you've sufficiently cheered up the Commissioners for them
24 to ask us questions now.

25 PRESIDENT PICKER: So a ringing endorsement of

1 our role as a feudal state and the divine right of
2 Commissioners. (Laughs.)

3 Jon, one of the challenges that we face, as we
4 start to look to replacing traditional Grid planning with
5 DER markets, is that everybody seems to be unable to agree
6 on which of the different DER assets best meet those needs
7 in that system. So all of our proposed DER projects seem
8 to have disappeared simply, because everybody thinks that
9 they're the people who ought to be preferred in terms of
10 providing those services. So we're not making as much
11 progress as we thought and I'm not sure that they're having
12 the success that they'd hoped to have in New York either.
13 Do you have any thoughts on this?

14 MR. WELLINGHOFF: well, again you've got to have
15 some kind of structure that allows for people to see
16 rational value. I mean, and you can look at PGM, for
17 example, where we set up demand response markets there that
18 ultimately brought in 15,000 megawatts into that market.
19 But I understand --

20 PRESIDENT PICKER: A lot of that was the
21 teamsters.

22 MR. WELLINGHOFF: -- what you're saying though.
23 You're ultimately still in a situation where you've got to
24 have somebody doing the planning and I completely agree
25 with that. And that planning has to be able to designate

1 through enough data analysis, and I know you're doing a lot
2 on the analysis of distribution system planning here in
3 California way ahead of everybody else on that. That you
4 can target and aggregate areas that will in fact, achieve
5 your goal. So whether it be the incumbent utility, whether
6 it be some independent entity, whether it be the Commission
7 there's got to be somebody who can designate and determine
8 that. And then figure out through perhaps a bidder and RFP
9 process to see if you can get third parties to come in and
10 aggregate distributed resources to in essence meet those
11 goals that you've set up to the planning process.

12 PRESIDENT PICKER: Okay. So for anybody here,
13 one of the challenges that we face is that information on
14 consumers is sometimes down to the individual building,
15 become very important in terms of third-party providers and
16 for planning for a variety of new tools.

17 Yeah, we've heard the importance of maintaining
18 confidentiality for many customers in the system. So the
19 incumbent utilities do a pretty job of protecting the
20 customers, but not such a great job in terms of helping
21 people who might otherwise be able to provide alternative
22 services, get access to that. Has anybody spotted any
23 successes or have any thoughts on how we'd begin to do that
24 better?

25 MR. CAVANAGH: Commissioners, I first want to

1 begin by acknowledging my gratitude to you, Commissioner
2 McAllister and others, for continuing to press on this
3 point. We obviously tried to start on a solution with AB
4 802, which a number of us worked on. I will say the only
5 customer that talked about confidentiality today, I thought
6 this was telling, was the CLECA representative Nora, and I
7 mean for proprietary industrial processes that's a
8 different problem.

9 But for buildings, commercial buildings,
10 residential buildings where we're trying to aggregate data
11 to get insight into energy efficiency opportunities and
12 other system needs I am daring to -- you didn't hear that
13 from anybody. You didn't hear anybody say --

14 PRESIDENT PICKER: No. But we hear it in other
15 places as well.

16 MR. CAVANAGH: We do, but I thought it was
17 telling that we didn't. And I am taking from that, since
18 my organization is putting in an enormous amount of effort
19 into making this happen, making it work, making sure that
20 802 works as planned and then going beyond it, I think
21 we're making progress. And I don't want you to give up.
22 That constructive pressure is needed.

23 And I'm seeing -- the other place where I am
24 seeing hopeful signs is in California's academic sector,
25 where people are figuring out how to aggregate that data

1 and make it useful. You both know some of the most
2 effective and able, let's just keep supporting them.

3 PRESIDENT PICKER: Other sources of inspiration
4 in terms of facts as to data?

5 MR. CAVANAGH: Or at least encouragement.

6 MR. WELLINGHOFF? Well, I know that at times that
7 third parties who are trying to aggregate these distributed
8 resource and optimize their value need things even way
9 beyond just simply what the usage is for energy efficiency.
10 But you need to have load curves and real detailed usage
11 over time varied (phonetic) usage as well.

12 And to the extent that you can set up a system
13 again that allows for third-party entities to aggregate
14 those facilities to provide those resources into a
15 distribution or a wholesale market, then those entities
16 should have relationships with their customer. And the
17 customer then should be able to release the data to them
18 via the utility just like we do for solar when I was at
19 Solar City. It should be sort of a similar situation I
20 would think.

21 MR. ORANS: I think one interesting example is
22 the telecom industry. So when they broke up the Bells and
23 all the customers then were basically free they took the
24 billing away from AT&T and the incumbent Bell. And so then
25 what you had is a couple of companies across all of North

1 America doing all the billing for everybody. They put a
2 logo on the customer.

3 So depending on what you decided to do with a
4 provider of last resort of a default auction etcetera, you
5 had to also think about what do you do with billing? And
6 if you move billing then to something else then billing
7 would have standardization through anybody who would have
8 some kind of access. And I don't know whether that would
9 be, as Ralph said, available to certain groups of customers
10 or from certain groups. Or would be more of a green
11 button, turn it over kind of process.

12 MS. TIERNEY: Can I just flip your question for a
13 minute? One of the things that I think might be helpful
14 for people to think about during this process, as you're
15 looking at the focus of data availability. I think it's a
16 problem and a challenging situation across the country in
17 states with a lot of penetration of distributed energy
18 resources where the utility doesn't have visibility about
19 what's going on either. Because of metering or because of
20 the information that may not be available about say a solar
21 panel on a roof and how much output is going to be
22 happening. So they see the net of that into the system,
23 but not necessarily what's happening, so thinking about
24 data on that other side might also be helpful too.

25 COMMISSIONER MCALLISTER: I want to jump in here,

1 because this runs the risk of getting a little wonky, so I
2 want to be just --

3 MS. TIERNEY: Oh, we would hate that.

4 COMMISSIONER MCALLISTER: -- yeah, or
5 inaccessible I guess is really the word, but so I'm in
6 exactly that situation. And many, many people are, so I'd
7 like to do more energy efficiency. I can't crunch the
8 numbers of my -- I don't have the complete picture, because
9 there's no automation in terms of combining these different
10 data sets. So all I can see is my net doesn't help me any.

11 So I asked a similar question in the last panel
12 and got the utility perspective on the answer, but if we
13 really want to enable the third parties to target and do
14 effectively, efficiently and with low transaction costs
15 identify those demand side resources or just distributed
16 resources they have to have sort of a leg up of
17 understanding. They can't be blind just knocking on doors,
18 right? They have to have some resource that directs them,
19 just *a priori* with the marketplace that they can serve
20 effectively and efficiently. And I guess I'm looking for
21 understanding the privacy issue and those concerns. I
22 guess I'm looking for structural solutions to that problem,
23 such as that in Oregon. And there aren't a lot of models
24 to choose from here that really get the job done, but I
25 think that's part of our big challenge. And I think we

1 need some ideas.

2 MR. CAVANAGH: But Commissioner McAllister, I
3 wonder if it wouldn't be possible also to the extent that
4 there is just residual unwillingness to have anyone other
5 than the utilities serve as the custodian of the aggregated
6 data, I wonder if we thought enough about partnership
7 models? The utilities, I mean we have all kinds of ways in
8 which the energy efficiency programs have the utilities
9 facilitating action by third parties. They don't
10 monopolize the services in any way.

11 If the issue is simply making sure that the data
12 are curated and that they are in the hands of someone who
13 at least has the maximum confidence and the maximum number
14 of players about absolute security, maybe there is a way.
15 And I'd just encourage us to think more about it. Of
16 having them, yeah sure they continue to do that, but they
17 are working with third parties. They're not trying to
18 perform the services with those data. They're not trying
19 to figure out all the clever ways to use them.

20 And the best example I can think of, that's
21 effectively what utilities have done with OPOWER for a long
22 time where they've got a third party who has access to that
23 data. Thinks up interesting things to do with it and
24 provides it as one of the energy efficiency services on the
25 system. I would think we could do a lot more with that.

1 COMMISSIONER MCALLISTER: Yeah, and we could
2 build on that to actually sort of deliver a deep array of
3 services, a wide array of services based on that knowledge.
4 You know, right now it sort of stops at the peer pressure
5 level, so we could go beyond that.

6 I guess just a point of information really for
7 everybody here, so AB 802 as Mr. Cavanagh, you referenced
8 that and the piece of that that we're talking about here is
9 the benchmarking piece. And there are regulations that are
10 most of the way through the pipeline that we've developed
11 at the Energy Commission, which have one, required the
12 utilities as of January of this year to provide whole
13 building data to the building owner, so rolled up whole
14 building data. So those systems are in place and a
15 building owner for most of the commercial and family
16 buildings in the state are now able to get their whole
17 building data. That's huge.

18 There will be a benchmarking requirement that
19 kicks in starting the middle of next year, July 1 of 2018,
20 for commercial, a year after that for multifamily. And
21 each building will have a time certain requirement to
22 benchmark their building. A year after those deadlines
23 there will be a public disclosure of at least some subset
24 of that information including the score, for example, of
25 each building. So you imagine you're floating over San

1 Francisco and you're looking at numbers floating on
2 buildings. And you're a building owner and that provides
3 market relevant information.

4 So division long-term is that we take those kinds
5 of tools and build on them to offer more targeted programs
6 to those sectors that need them. We identify where the
7 savings potential is and we really focus in a much more
8 surgical way on solving the problems effectively and
9 efficiently harvesting demand side and demand response
10 opportunity.

11 So there is a lot of really, I would say positive
12 progress on these fronts, but we need a lot more to really
13 have a truly robust market that allows our buildings to
14 serve as a much bigger part of the solution as at least I
15 and many others I think, believe they can.

16 CHAIRMAN WEISENMILLER: Yes, I have a couple of
17 questions. Sue, you mentioned how POLR has been generally
18 successfully dealt with, what are the key elements of
19 programs to do that?

20 MS. TIERNEY: I think Ren's answered this the way
21 I would now, making it very clear who has the obligation to
22 serve. And then in keeping that making it very clear under
23 what terms and conditions you may leave and what your costs
24 will be if you're a departing customer. How long you have
25 to stay away.

1 In the early years of restructuring in most of
2 the states, that had a wires only utility and divestiture
3 of generation, there were transition contracts that allowed
4 customers to stay on a rate for a certain number of years.
5 Now, those are pretty much all gone. And so the norm is
6 that you have to stay away for awhile before you can come
7 back and if you come back, you come back at market prices
8 for your commodity.

9 I do think the other element of it was the very
10 careful cost allocation process that led to non-
11 discriminatory non-bypassable charges, so that there was
12 not a creation of an economic bypass. So to speak,
13 encouraging people to leave, because of some distortion in
14 the rate design. So that's one that I think is high on the
15 list in terms of what I know people have suggested in how
16 you deal with your legacy costs. That's clearly an
17 important one.

18 CHAIRMAN WEISENMILLER: What about looking across
19 the states in that context? What's been the most
20 effective, efficient way of really promoting energy
21 efficiency?

22 MS. TIERNEY: I think I would say making it clear
23 who has the responsibility. In most of the states that
24 have continued to keep an energy efficiency role as part of
25 the restructuring process, the funding for that was created

1 as part of not a bypassable charges. And that money was
2 either given to energy efficiency utilities such as in the
3 District of Columbia, or have the obligation fall on the
4 utility to do the programs. But then a lot of third-party
5 contracting to deliver it.

6 CHAIRMAN WEISENMILLER: So just following up with
7 Ralph, obviously. I think the two of us have had -- you
8 know, looking at the California experience I think the
9 three things that have been very important on the energy
10 efficiency side are decoupling, providing the appropriate
11 rate signals, and then obviously trying to get programs in
12 place on utilities to replace generation with energy
13 efficiency.

14 Going forward, how do we maintain those when we
15 know like with the CCA model there's no decoupling at this
16 stage?

17 MR. CAVANAGH: Yeah, I don't think the CCA model
18 is a major challenge here. And this would be one of my
19 rare points of disagreement with when this discussion came
20 forward with the utility panel. There was a suggestion
21 that somehow if you have a CCA managing your generation
22 portfolio the utility can't manage your energy efficiency
23 portfolio. I don't agree with that. By and large, the
24 CCAs define themselves as generation commodity providers.
25 You heard that. That's what they want to do, that's the

1 business they want to be in. They're not going into the
2 energy efficiency administration business.

3 From my perspective we've got a very good
4 partnership model. Obviously, utilities don't monopolize
5 the services. They have an important administrative role.
6 They work with a whole host of independent parties. And
7 it's a model that's served California very well over the
8 decades that it's evolved. I don't think we have to give
9 it up. I think there's as the Commissioners, and the PUC
10 Commissioners in particular have heard me say more than a
11 few times, they're probably tired of it, there's a lot for
12 us to do on measurement and evaluation.

13 And there, I think we can learn from some of our
14 neighboring regions that are doing it better. And I know
15 we're all working together hard to try to make it better.
16 But I don't think we give up the model just because we've
17 got some greater diversity in generation procurement.

18 COMMISSIONER PETERMAN: I do want to clarify that
19 the current model does allow for CCA participation on
20 energy efficiency. Marin Clean Energy, administers energy
21 efficiency programs and so we are able to do that within
22 the current construct.

23 MR. CAVANAGH: We are, although Commissioner
24 Peterman, they are the only CCA that's doing it and they
25 are not doing it for all of the efficiency programs in

1 Marin. So there's still a robust utility role even in
2 Marin. And I think that's a good thing.

3 COMMISSIONER PETERMAN: I agree.

4 CHAIRMAN WEISENMILLER: Obviously you set up the
5 obvious question of well, what are your recommendations on
6 EM and V?

7 MR. CAVANAGH: There are so as we think forward
8 as to how are we going to handle the energy efficiency
9 resource in California, I do think this is an important
10 issue for continued attention from all the Commissions.
11 It's important also for efficiency standards. It's not
12 just a PUC matter. It's an Energy Commission matter. And
13 what I would want to say about that is that I think we find
14 ourselves in a place where EM and V has just become too
15 contentious, adversarial and cumbersome. Everybody thinks
16 that. And the issue is how can we get out of it?

17 And for me, the model that I hope we'll continue
18 to build on and we've started, is to rely more on what I
19 would describe as a jury model where we get juries of
20 experts modeled on the northwest regional technical form.
21 We've got a California technical form now in place that is
22 similarly structured. And we rely less on adversarial
23 proceedings, an excessively contentious existing model, and
24 we move more toward a system that is willing to rely also
25 on peer review, on the experience of sister jurisdiction.

1 Sue Tierney's Northeast has done great work with
2 measurement and verification. She and I know many of the
3 people responsible.

4 This is the one thing from my perspective, we
5 don't do particularly well, where we do have other regions
6 that are ahead of us where we can learn a lot. And it
7 matters simply to have Commissioners asking those
8 questions, looking internally how can we do better? And
9 talking to all the parties involved.

10 The most fundamentally important thing is to
11 change what is now an adversarial process into a
12 partnership model where we're learning together from things
13 that don't work. And fixing it rather than constant games
14 that that feel very much like a litigation-oriented EM and
15 V, which is not the best way to do it.

16 COMMISSIONER PETERMAN: I will note on this issue
17 for those who aren't with earnest following the energy
18 efficiency proceedings at the Commission, that we've taken
19 a number of steps in the last year to try to address these
20 common questions and concerns. So we're currently
21 considering business plans from the utilities, which are
22 about certainty and programs around ten years of funding.
23 But there are -- and incorporating things like embedded EM
24 and V, having multiple stakeholder groups informing a
25 process. And so there's a lot going on there.

1 But I use that as an example to say as we see a
2 change in potentially who is serving customers, we will
3 have to look at the fact that we have been making wholesale
4 changes to some other parts of aperture demand side
5 management. So in energy efficiency we're moving in the
6 direction to more statewide programs, for example, more
7 third parties. What does that mean if you have a majority
8 CCA state or a departing load?

9 So it gets to this question about trigger points,
10 which Ren raised, which is I think it would be important
11 for us to look our proceedings and say what are the major
12 actions we've directed that we're building towards? And we
13 would like to have more certainty around how those
14 scenarios well look differently if we're seeing departing
15 load change. And so energy efficiency is an area where we
16 are trying to do significant change. And so it will be
17 helpful to think through that scenario about how might a
18 ten-year business plan change if in five years we started
19 to see the majority of L.A. load, for example, go CCA?

20 CHAIRMAN WEISENMILLER: Okay. And so I --

21 COMMISSIONER MCALLISTER: I want to --

22 MR. CAVANAGH: Just a quick one, I am grateful
23 for all that you are aware of that are participating in all
24 of those programs. If I could, my gentle suggestion though
25 would be to think hard about whether the future of CCAs

1 need not affect the future of energy efficiency
2 administration if, as I predict -- and we'll need to make
3 sure this is in fact what evolves -- the CCAs prefer not by
4 and large to define themselves in that way.

5 In that case your drive toward more statewide
6 uniformity, toward getting more economies of scale if you
7 will out of the programs, will I think be utterly
8 unaffected by what we choose to do with generation
9 procurement. And let's at least be open to that. In the
10 northeast I would say that by and large we have retained,
11 despite a remarkable amount of fragmentation in procurement
12 of generation, a lot of uniformity in program
13 administration for energy efficiency.

14 COMMISSIONER MCALLISTER: I want to jump in here,
15 we sort of segued from the data topic into this. But I
16 think the data topic is actually really relevant here too
17 and it provides a lot of power to supplant some of the
18 onerous EM and V we've got in place. And we can actually
19 do a more performance-based energy efficiency program
20 environment, because we have access to a lot of data or a
21 lot of sort of a continuous flow of information that allows
22 us to see how things are happening. And it allows us to be
23 more flexible on program design going forward. And I
24 guess, I think there's a huge amount of promise there. And
25 that together with the technical forum, could actually

1 provide a nice environment that captures a productive and
2 sort of positive relationship across the EM and V community
3 and implementers. Rather than, as you say, have kind of an
4 adversarial relationship that sort of comes across a little
5 bit as second guessing. You know, after the fact. And I
6 think that is corrosive as you say.

7 So I'm getting to a question here. What parts,
8 you know we talk a lot about procurement. We've talked
9 about energy efficiency. And I was the one who said "bolt
10 on" at the beginning, right? And so I think that's kind of
11 where we're still at and we haven't really sort of
12 accepted the need to get beyond that approach, having sort
13 of a room over here where energy efficiency is done. And
14 then a room over here where procurement is done. And I
15 think I guess my question then is what pieces of the energy
16 efficiency enterprise -- and I'll open it to demand
17 response too, they're both at the top of the loading order
18 still today, right? -- what pieces lend themselves to
19 procurement? And kind of this performance-based approach
20 would have to be rigorous and all that right, and what
21 pieces don't? You know, say low-income or something like
22 that, where they really do need a program. But I think I'm
23 interested in hearing your thoughts about what pieces of
24 demand side could be procured?

25 MR. CAVANAGH: Hey, Commissioner McAllister, I

1 think they all -- I don't want us to give up energy
2 efficiency as a resource in California. They all can be
3 procured. Energy efficiency standards are in a special
4 place, although we want them integrated with obviously the
5 procurement programs. And that's been our special genius
6 having them work together and not treating them as
7 alternatives to each other.

8 But the IRP process that the PUC is overseeing is
9 one that can continue to treat efficiency and demand
10 response as a resource, can look across the entire system.
11 Yes, there will be more entities involved in procurement of
12 generation, but I hope you won't change at all your
13 insistence that this is the top of the loading order. And
14 this is going to be front of mind for the whole integrated
15 resource planning process. I didn't think any of us signed
16 on to change that.

17 COMMISSIONER PETERMAN: Can I take the questions
18 in a little different direction given time? I want to talk
19 about New York, so I'm going to admit when New York
20 launched their docket a couple of years, I had some New
21 York envy. Suddenly, we weren't the innovative children
22 anymore. New York was where the action was and a very
23 ambitious and impressive docket there. And now that
24 there's been some time and we've seen New York go about
25 really trying to do this groundbreaking work, I wondered if

1 those of you who are following that process more closely,
2 could identify what are some of the expectations of that
3 process that perhaps are going slower than anticipated or
4 in a different direction? Because I think that's a sister
5 state that we might be looking to as a model and it'd be
6 helpful not to repeat any potential challenges they are
7 running into, from your perspectives.

8 And Ren, do you want to start with that one?

9 MR. ORANS: Yeah, I'll answer it in two ways. So
10 you can look at New York as it started with all the, what
11 I'll call distribution retail access stuff. And then it
12 morphed to much more like what you're familiar with was
13 clean energy standard, which we are a way down that road.
14 So but they get the benefit of us going first on that one.

15 So the big fight was, well are these all going to
16 be auctioned RECs from NYSERDA, which is so clean for their
17 power system it doesn't have a missing money problem on
18 capacity costs and everything, all the operational, all the
19 transmission, etcetera. Obviously you know what happens
20 then is well what about the local job impacts etcetera? So
21 they're probably end up with something akin to buckets and
22 we know how that works out. So I don't need to tell you
23 that story.

24 The DER one is more interesting, because Audrey's
25 gone now. NYSERDA and the staff are still committed to the

1 vision. ConEd is already very similar to the DSO already.
2 I mean, look at them. They're a network distribution
3 company. They control all the flows up through to the ISO.
4 Jon will know that as they're as close -- if you had to
5 pick a utility in the country at the distribution level
6 that's pure play distribution, but it looks like a DSO, it
7 looks like ConEd.

8 Okay. Now, take Central Hudson, it's totally
9 rural and it's saying, "Are you kidding me? You know, 17
10 functions in the DSP. We have a couple of cities. We'll
11 do AMI." They filed their AMI stuff. "We'll do our
12 dispatch of DER." And the roadmap actually that I showed
13 you is kind of what we're working on them through the five
14 utilities to see all right, if ConEd went first and did
15 more of these DSP commercial functions -- and Jon will
16 know, because this is partly about what his paper is.

17 What happens is Audrey's vision was you've got
18 the utility core functions, say there are six or seven of
19 them. And then if we have a big rich DER market let's add
20 seven more functions. And those gradually move you more
21 and more to commercial, right? Until you get so many
22 commercial things that you do what Jon says is well it
23 looks now like it's commercially doing settlement. And
24 it's picking winners and losers and it's got its operations
25 and it owns assets. And that's when it becomes really

1 messy and you have to either ring fence the wholesale 88
2 tariff or create a DSO.

3 And so we're trying to work through with the
4 utilities actually what those trigger points would be in
5 moving from one model, and we've created everything from a
6 BAU cases all the way though to much more complex cases.
7 And they're trying to figure out in each utility who they
8 are.

9 I would even suspect if you asked the three
10 California utilities or the MUNI publics as well, they all
11 have different visions of that DSP model. We have like 17
12 functions that you would need and we've identified as
13 emerging functions, core functions, and commercial
14 functions.

15 COMMISSIONER PETERMAN: So is the expectation
16 that eventually they will all do the same thing or do you
17 see them ending up in end states?

18 MR. ORANS: There are exits all the way along
19 that road. You know, rural areas and that DSO model
20 probably just don't make that much sense and the densely
21 urban, it fits much more.

22 MS. TIERNEY: Commissioner, can I add two
23 minutes, because then I have to leave for my airplane in
24 any event. Remember New York is unlike I think any other
25 state in terms of its organic jurisdiction statute. They

1 didn't restructure based on legislative action and they can
2 do things of a whole cloth in a way that very, very few
3 states can including California I would put into that
4 bucket. And the resource adequacy in California is so
5 different than in New York. And so I think that that's an
6 overlay that really you want to pay attention to when
7 you're looking at that there.

8 COMMISSIONER PETERMAN: Thank you.

9 MS. TIERNEY: Thank you so much for inviting me
10 to join you today and best of luck. As everyone has said
11 this is where a lot of stuff is happening and you have
12 really tough jobs. Thank you.

13 COMMISSIONER RANDOLPH: Sue, can I ask you one
14 quick question before you go?

15 MS. TIERNEY: Yes, of course.

16 COMMISSIONER RANDOLPH: On the topic of long-term
17 planning, you mentioned in Massachusetts that they were
18 finding the market wasn't giving them the sort of policy
19 goals that they wanted. What sort of tools are they
20 putting in place to deal with that long-term planning
21 issue?

22 MS. TIERNEY: Great question, the state does not
23 do a long-term plan. The utilities don't do the kind of
24 long-term planning that an IRP type of work that you do
25 here. Connecticut does by the way, but the six states have

1 adopted a very rigorous RTO planning model, long-term
2 planning model under the rules that FERC established. And
3 they've used that to put into the scenarios that are
4 considered by the New England ISO, various studies that
5 they want to have done about different economic scenarios
6 or targets for greenhouse gas reductions or a variety of
7 other things.

8 So I think the planning that you do here, which I
9 will never call Soviet state planning unless they start
10 cyber-attacking you, that is very different than what
11 exists in the northeast. Thanks.

12 COMMISSIONER RANDOLPH: Thank you very, very
13 much.

14 PRESIDENT PICKER: Thank you. I think we're
15 going to have to call this panel to an end. I do want to
16 say that nobody mentioned the most important feature of the
17 regulatory system in New York, which is that the president
18 directs all the staff, runs all the cases and the other
19 Commissioners just come and vote. (Laughter.)

20 COMMISSIONER PETERMAN: Good luck with that.

21 PRESIDENT PICKER: So that's not soviet style.

22 COMMISSIONER PETERMAN: It's true. And the
23 president left that Commission.

24 (Off mic colloquy.)

25 PRESIDENT PICKER: Yeah, I'll go there. So thank

1 you and I want to thank all the panelists.

2 This is the time that we promised for two things.
3 One is to hear from the public and then for closing
4 comments from the Commissioners. So we have about ten
5 people who've asked to speak and if we take a half hour
6 that gives each of them three minutes. Do we have any
7 other cards that I don't have up front?

8 Okay. So it's going to go to two minutes, I'm
9 afraid. So essentially what we're asking for you to do is
10 to introduce your central issues or your central themes,
11 and then to submit to us written comments that we can then
12 actually distribute as part of the record.

13 So I'm going to call people up by twos, so that
14 everybody has a chance to walk up. I'm going to start with
15 Aubrey Stone from the California Black Chamber of Commerce,
16 Mr. Stone. And then John White from CEERT. And two
17 minutes, I'm sorry but given the number of extra cards I
18 just got that's a fair amount of time. Just kind of
19 introduce the major themes and then please give us written
20 comments.

21 Mr. Stone, there's two microphones up here, then
22 John White.

23 MR. STONE: Good afternoon.

24 PRESIDENT PICKER: Press the button, so that you
25 get the mic turned on. It should be a green light. How's

1 that?

2 MR. STONE: Good afternoon, everybody. I'm
3 Aubrey Stone, President and CEO of the California Black
4 Chamber representing small and emerging businesses here in
5 the state. And I just simply want to be real quick and say
6 that minority and minority business communities, especially
7 those that are in more economically vulnerable areas of the
8 state, should also benefit from broadening the energy
9 choices. And should not be left behind by lapses in the
10 regulation.

11 As California explores expanding customer energy
12 choice we believe it is critical that regulators and
13 legislators alike pursue policies that ensure all
14 Californians can benefit equally from choice regardless of
15 where you live and what your income is.

16 It is also important and we want to make sure
17 that policies prevent cost shifting, so that customers who
18 do not immediately have choice or do not decide to choose
19 an alternative provider are not left behind in subsidizing
20 those that do so.

21 That's all, thank you very much. I'm glad to be
22 here. It's good to see you, Carla.

23 PRESIDENT PICKER: John White and then Jean
24 Clinton.

25 MR. WHITE: Efficiency and renewable

1 technologies, thank you for letting me speak. Just a
2 couple of thoughts and reflection of today's comments,
3 first is that as the gentleman from Sonoma Clean Power said
4 earlier today, the goal of the enterprise here is to use
5 renewables as a tool to get greenhouse gas emission
6 reductions not just as an end in themselves. So what we
7 need to think about is how are we going to get the
8 procurement we need to meet the greenhouse gas reductions,
9 not just how to get the cheapest renewable kilowatt hours.
10 So we need to think about how the oversight is going to
11 occur with respect to, particularly the community choice
12 aggregators. So that we can see that they are in line with
13 the greenhouse gas goals that everybody else is trying to
14 meet.

15 The second thing, the staff paper doesn't really
16 mention or reflect on the need for large scale
17 infrastructure that is going to be needed for achieving the
18 climate goals. That's not likely to show up in the
19 procurement of the load-serving entities, either because
20 the projects are too large or because the risks are too
21 great given the threat of people leaving the system.

22 So I think we need to think about how we're going
23 to finance the needed infrastructure. And maybe one way we
24 could think about doing it, is to have there be some
25 aggregated look at what everyone has been buying,

1 aggregated together. And then see what residual need is
2 going to be left and how are we going to go about doing
3 that?

4 We, in the past had the Department of Water
5 Resources play a role and we had the California Power
6 Authority. But clearly there's going to need to be some
7 system-wide infrastructure that isn't going to be cost
8 recovered through the procurement of the various load-
9 serving entities.

10 And then lastly, I thought the point that was
11 made about the credit-worthiness of the counter-parties
12 with regard to the CCAs versus the utilities is going to be
13 very important for financing the amount of renewables we're
14 going to need to get to the greenhouse gas target. So I
15 think that's a fair point to reflect on.

16 And then lastly, a transparency is going to be
17 crucial for making all of these comparisons in terms of
18 both the performance of the procurement as well as the
19 cost. So thank you.

20 PRESIDENT PICKER: Thank you.

21 Jean Clinton then Julian Canete.

22 MS. CLINTON: So I'm Jean Clinton, representing
23 only myself. I have three observations and then a
24 question, a rhetorical question to pose. The observations
25 are built on both listening today and spending the first

1 three days of this week in Washington at the DOE Better
2 Building Summit, which was filled with people from the
3 commercial real estate industry and finance figuring out
4 how to do better buildings.

5 So my three observations are first the efficiency
6 pace is terribly slow relative to the economic potential
7 that we've all identified.

8 Secondly, the current investment framework or
9 paradigm has to work in the context of real estate returns
10 with only five-to-seven-year hold timeframes, business
11 competition for capital within industry and commercial
12 enterprises and the lack of emergence so far of a real
13 visible market value for green or EE in the real estate
14 markets.

15 Third, another observation, we don't ask
16 homeowners and commercial real estate investors now to self
17 finance 20 to 30 years worth of energy requirements that
18 they're going to need. They just get to pay for it on a
19 pay as you go basis every month.

20 So that's the context. Here's my question.
21 We've been talking about the potential role in utility
22 investment and the utility roles as counter-parties. Could
23 we imagine the potential for our utilities to arrange
24 capital to support long-term (indiscernible) as service
25 transactions that would include EE, onsite solar, storage,

1 possibly EV charging, that would be available at more
2 attractive returns than the commercial real estate industry
3 offers today? That would earn for the utilities a return
4 on the actual or virtual asset where there would be some
5 sort of quality standards for the programs or the providers
6 that would reflect some assurance of performance. And with
7 some sort of cost recovery collection mechanism that could
8 be tied to the property or the meter via some sort of a
9 tariff?

10 So that's my rhetorical offering of how to blend
11 this in to this future vision. Thanks.

12 PRESIDENT PICKER: Thank you.

13 Julian Canete and then Rick Brown?

14 MR. CANETE: Thank you, President Picker,
15 Commissioners, thank you for the opportunity to address
16 you. Julian Canete, I'm Public Policy Director at the
17 California Asian Pacific Chamber of Commerce. The Chamber
18 currently represents the interests of the over 600,000
19 Asian-Pacific/Islander owned businesses throughout the
20 state.

21 The point that we did want to make, of course
22 it's no surprise that every business needs access to
23 reliable and affordable electricity. Based on that, some
24 small businesses may choose to take advantage of energy
25 choices available to them and some may not. We know this,

1 because we did extensive surveys with small business users
2 throughout the state that were done in the Central Valley,
3 Southern California, etcetera.

4 In order to make decisions that are best for
5 them, small businesses and all electricity customers should
6 be confident that there is a level playing field. Everyone
7 should have access to the same choices and nobody should be
8 paying more than their fair share. We feel that this is a
9 point that we need to get at, and would like assurances
10 that that's the direction we're moving in. Thank you.

11 PRESIDENT PICKER: Thank you.

12 Rick Brown then Craig Goodman.

13 MR. BROWN: Good afternoon, Rick Brown,
14 TerraVerde. One of your earlier panelists referred to a
15 LVL study by Galen Barbose that basically said that the
16 PUCs around the country need to pay more attention to the
17 huge CapEx associated with getting to aggressive RPS goals
18 versus the amount of attention that's being spent on
19 concerns about cost shifts associated with distributed
20 generation.

21 We believe that DG and DERs in general are not
22 getting enough credit for the avoided TND costs that
23 they're providing. Case example, in November PG&E
24 announced the deferral of a \$143 million Gates-Gregg
25 Project, because of growth of DERs in the greater Fresno

1 area. A number of the schools who we work with to put in
2 solar and battery storage called and said, "Are we going to
3 get any of that money?" They put in these DERs for their
4 behind-the-meter benefits, but they also did provide
5 benefits to the rest of the ratepayer base and we need to
6 acknowledge that.

7 We believe also that CCAs are an entity that can
8 provide some of the kind of aggregation of DERs in a more
9 efficient way similar to what Jean was talking about,
10 actually. And provide the procurement support and do it in
11 an organized way to meet some of the kinds of needs that
12 are out there. And I guess we recently got a grant from
13 the CEC working with Marin CleanEnergy to test out that
14 model and we'll be reporting on that in the coming years.

15 The last point is that around this issue of
16 accountability and who's responsible for some of these
17 needs, you know, the last resort concept, CCAs are
18 government by publicly-elected people. It's not the same,
19 we shouldn't be comparing them from a competitive retail
20 model to what was occurring in the past. So I encourage us
21 to look at that through that lens, that they are public
22 entities with a public purpose.

23 PRESIDENT PICKER: Thank you.

24 Craig Goodman then Karey Christ-Janer.

25 MR. GOODMAN: Thank you, Mr. Chairman and

1 Commissioners. My name is Craig Goodman. I'm President
2 and CEO of the National Energy Marketers Association. We
3 just celebrated our 20th anniversary. We started just
4 after -- someone showed a Blue Book in this audience --
5 just after that Blue Book started.

6 I started a little before then and my first day
7 in government I went to Government Energy Pricing School.
8 I was a Special Counsel to prosecute oil companies for
9 overcharging for gasoline during the gas lines of the '70s.
10 And I had an opportunity from that point to this point, to
11 become a staunch advocate for competitive choice in not
12 just natural gas, but electricity and virtually anything
13 else in the energy field that is susceptible to
14 competition.

15 To make you feel more comfortable, aside from
16 being the progenitor of retail choice you now have over --
17 I want to say 14 million -- excuse me, 16 million Americans
18 have a choice. In Nevada recently, they voted to have
19 choice. They voted for a constitutional amendment to have
20 a choice. There are 7 million residential consumers in
21 America that have natural gas choice and it's working well.
22 It's working very, very well.

23 Those of you who have picked up some antenna
24 (phonetic) from New York and some allegations of ill
25 conduct, I can tell you the complaint rate versus the

1 number of consumers shopping is so low that we don't even
2 get up to a 10th or 100th of 1 percent of the customers
3 shopping, are complaining about a bad experience, which is
4 an extremely important point here.

5 And then the last point that I think that all of
6 you want to know, when it was done right and it has been
7 done right -- and I'm going to use one state, but there are
8 several -- in the State of Texas from the day they had
9 regulated rates until today the prices of electricity have
10 gone down 65.9 percent inflation adjusted.

11 Thank you very much.

12 PRESIDENT PICKER: Thank you.

13 Karey Christ-Janer then Ed Mainland.

14 MS. CHRIST-JANER: Good afternoon, Commissioners.
15 I'm an independent advocate here in California and also in
16 Colorado. And I wanted to first point out, there's been a
17 lot of discussion about jurisdictional issues, which is you
18 know, very thorny when it comes to the IRP. And looking at
19 legislation that is going through Committee process right
20 now, SB 618, and I just wanted to remind that the Oxford
21 Dictionary definition of the word "review" -- if it's going
22 to be review and then certify -- the Oxford Dictionary
23 definition is a formal assessment of something with the
24 intention of instituting change if necessary.

25 And I think that that's really key, because I do

1 believe that SB 350 gives the Commission wide authority.
2 And my personal hope is that the IRPs will -- that the
3 Commission will be able to have a coordinating role, which
4 I think will be very key. And I've spoken in front of most
5 of you before about that.

6 And now I want to just say that I've also filed
7 numerous previous comments in the IDER proceeding and I'm
8 now going to limit these comments to basically what I've
9 already filed. And that is that I believe that a CCA-IOU
10 partnership model may be able to, similar in many ways to
11 what I think NRDC and some other people have spoken of, so
12 that the entities are not working at cross purposes.
13 Because after all, when post-allocation gets more aligned
14 you may find more migration.

15 And then let's say you've got 75-25, if you're
16 going to do a phased DER program for example, it's going to
17 be very difficult to coordinate that when you've got two
18 different controlling entities potentially coordinating the
19 EE programs or the DER programs. Which also speaks to the
20 idea of a more centralized role, whichever entity it is.

21 And on that note, I'd also have mentioned in the
22 Competitive Solicitation Framework Working Group, in one of
23 the working groups that I headed up with SiSi Song
24 (phonetic) from MCE that the marketing powers of IOUs is
25 something that needs to be considered the familiarity with

1 the entity. And that is I also think needs to factor in,
2 coming from a marketing background.

3 Thank you very much.

4 PRESIDENT PICKER: Thank you.

5 Edward Mainland and the Doug Karpa.

6 MR. MAINLAND: Good afternoon, everyone. I live
7 in Marin, California. There is an energy revolution we
8 see, but where there isn't a revolution is in regulation.
9 And the regulatory structure many say is the chief block to
10 progress in this energy revolution.

11 An illustration was Mr. Picker's comment a year
12 ago in a public interview. He said that community choice
13 is, I believe I'm quoting you correctly Mr. Picker, forced
14 collectivization. Calling up images of Ukrainian peasants
15 being herded into collective farms, well by performance
16 community choice is the most powerful and most democratic
17 force available to meet greenhouse gas targets and to scale
18 up distributed generation in California.

19 So the CPUC I would say, needs to get out of the
20 way of CCA innovation. That means no more outlandish CCA
21 liability bonds, proposals, no raising of the direct access
22 cap, no perpetually rising PCIA, no nitpicking in IRP
23 micromanaging. The cities and towns of Marin, for example,
24 this month or next month will have opted their accounts up
25 to 100 percent renewable power. So that (indiscernible) is

1 our great climate hope and I hope you don't get in the way
2 of community choice. And I hope you'll let the revolution
3 roll. Thank you.

4 PRESIDENT PICKER: Thank you.

5 Doug Karpa?

6 MR. KARPA: Yeah, thanks very much and much
7 appreciated that you're still hanging in here this
8 afternoon. Doug Karpa, the Policy Director with Clean
9 Coalition and I wanted to really raise one issue. We work
10 primarily on DER issues in removing barriers to those.

11 And one of the things we note is that -- I think
12 the speakers have alluded -- that the deployment of DER is
13 slower than it might otherwise be in some places. Germany
14 and the UK are pretty well outpacing us. And several
15 speakers have suggested that it's critical to consider new
16 business models, new compensation models, which could be
17 key to the development of a lot of the innovative services
18 I think we're going to need in order for both DER to get
19 full compensation for the values that they do provide to
20 the Grid. And also for customers to be able to get what
21 they really need.

22 So first, I would urge you to really engage in
23 the consideration of new business models. And as you do
24 that, one pretty strong option I think would be the
25 creation of DSOs in California. Which could be done simply

1 to the extent that anything is simple in energy policy
2 ever, by putting a bright line between distribution and
3 transmission assets. One of the concepts we're working on
4 really is to take existing utilities and to divest
5 transmission assets, which would have the effect of taking
6 utilities and converting them into enteritis that really
7 have to compete intensively as DSOs. And focus on
8 innovating the whole suite of services both for themselves
9 to have a profitable business for customers to deliver
10 value. And for all the DER assets to recoup revenues for
11 all of the services that they provide and that can be a
12 very powerful lever for driving change.

13 So we'll provide you comments on that going
14 forward, so thanks so much.

15 PRESIDENT PICKER: Thank you.

16 So that completes the public comment period. And
17 I'm going to turn it over to the Commissioners to make
18 closing comments and whoever would like to go first. We
19 can start at this end and work our way, this way.

20 COMMISSIONER GUZMAN ACEVES: Well, thank you all
21 for sticking it out. I do think it's been very helpful to
22 hear from all the different perspectives. I think for me
23 it was really helpful to hear about the other states
24 experiences even though some of them were in the inverse.
25 And kind of continuing to ask the question where are some

1 of the responsibilities and obligations best figured out
2 through a kind of non-bypassable approach where everybody
3 is paying in. And where is it a general obligation that
4 folks are figuring out through their different procurement.

5 But I think in general as we kind of move forward
6 here, it's not that the customer choice cannot afford these
7 greater opportunities, but there is certainly lessons
8 learned from other states in our own history that we cannot
9 assume that they will be there.

10 And so those are certainly the different
11 structures that we can hopefully fill in as we move along.

12 COMMISSIONER MCALLISTER: So I won't attempt to
13 summarize any of the conversation, but I've really enjoyed
14 today. I thought it was really helpful and productive and
15 a lot of themes were surfaced, most of which we were kind
16 of obliquely familiar with at least. But it's helping to
17 put a finer point on the discussions going forward, so I'm
18 looking forward to looking at the written comments. I
19 would encourage everybody to submit those.

20 And moving on, both within our agencies, but also
21 hopefully we can keep this joint discussion going as we
22 move forward. Thanks everybody, for sticking it out
23 through the day.

24 COMMISSIONER RANDOLPH: I'll just briefly say
25 thank you to everyone and it's a beautiful Friday evening

1 out there, so I'll just thanks and move along.

2 CHAIRMAN WEISENMILLER: That's good, Thank you.

3 I think at this point we're all trying to keep it
4 fairly short, but I think obviously one of the things that
5 we need to be thinking about is we talk a lot about how the
6 market's being transformed, how the utilities are being
7 transformed, etcetera. And I certainly encourage people in
8 the written comments to think about well how do we need to
9 change the PUC and other regulators to deal with the
10 changes going forward. And I would just note that when I'm
11 ever in Germany I always point out that the Germans include
12 hydro as renewable. And if you do that we're greater than
13 they in terms of percentage of renewables. Thank you.

14 PRESIDENT PICKER: So ...

15 COMMISSIONER DOUGLAS: Go to this end, so I also
16 really enjoyed the discussion, the panels today. I
17 appreciate those of you who stuck around to make public
18 comments. You know, as some of the people in the last
19 panel said, many of these issues are not new. They come
20 back to us and they resurface over the years. But
21 certainly the circumstances that we find ourselves in today
22 with our tremendous success on renewable energy. And our
23 need to address that success and set the stage for further
24 achieving our renewable energy and climate goals in a way
25 that also meets this broad range of needs in the

1 electricity sector is what's before us today. And it puts
2 a pretty unique context around this.

3 And so anyway I've really enjoyed this and
4 appreciated the chance to be here.

5 COMMISSIONER PETERMAN: Yes. Thank you, for all
6 of you, for a very informative en banc. I think like many
7 of you I believe in carefully regulated markets and I also
8 believe in a welfare state. And those can be difficult
9 ideas at times to marry, but I do think it's very
10 fundamental to how we've approached energy policy as a
11 state. And so I do want to make sure that we are keeping
12 in mind both the opportunity we have here to let markets
13 come forward with some solutions, but also make sure that
14 we're providing accessible and affordable power and
15 resources to all Californians. And we don't want to lose
16 perspective on either of those ends.

17 And so I really appreciated Ren's comment about
18 where we'll probably end up. Where we are even now is
19 somewhere between command and control and a fully laissez
20 faire perspective. I mean, I think the difficult part is
21 figuring out who should be responsible for what.

22 And following up on Commissioner Weisenmiller's
23 point about the role for the agencies, I think we've talked
24 at times about how these trends are inevitable. But I do
25 think they're largely driven by the policy choices we've

1 made. And there are certain policy choices we've made that
2 we are committed to that we've made to 2050. And there's
3 others that are smaller, but as important in how we
4 approach RA, how we approach net energy metering that we
5 talk about having iterative to approach. And so I do want
6 us to not think about this as something inevitable, because
7 we have the power to make changes and move things in a
8 direction we like.

9 And so I do think we're at the stage where we
10 need to start thinking about what the end state really
11 looks like. We've talked about what we want it to be for a
12 greenhouse gas perspective, but I do think we could provide
13 some more clarity around vision, around institutional
14 structures. And so what I'm looking to understand over the
15 next several months is, particularly are there types of
16 utility business models that just will not work in any
17 circumstance for the vision that we have? We don't have to
18 pick the final model, but I like to eliminate the worst
19 possibilities.

20 And so I'll really be looking for input along
21 those lines including what about other structures that are
22 just nonstarters for California? That helps us narrow down
23 the choices. I'd rather be left ultimately with a set of
24 options that are mediocre to great versus great to really
25 bad. So if you can help us narrow that set, that would be

1 greatly appreciated. Thank you.

2 PRESIDENT PICKER: So I just want to reflect on
3 the fact that some of our Commissioners who were in high
4 school when we had the first energy crisis after
5 deregulation and as such --

6 COMMISSIONER PETERMAN: Well, certainly in
7 college.

8 PRESIDENT PICKER: -- that's also true of some
9 members of the audience. And so I'm just going to
10 recommend two documents that I found helpful. One is
11 "Smart Power" by Peter Fox-Penner, which recapitulates the
12 history of the electric industry and how it's changed over
13 time. I thought it was accessible and pretty useful, and
14 he does get to an analysis of how technology is reshaping
15 the current electric industry and some of the pitfalls and
16 opportunities.

17 And also I'm going to point to, since somebody
18 specifically asked me what happened in California during
19 the energy crisis, a book called "Soul of the Grid" by
20 Arthur O'Donnell who was a reporter when he wrote that.
21 And is now with the California Public Utilities Commission,
22 which talks a lot about some of the things that we've all
23 discussed as seeing in the Grid right now, but not sure how
24 we actually prepare for the challenges that we face.

25 I'm just going to say that having heard the

1 multiple voices and the multiple approaches, it's clear
2 that there's not an agreement. As the guy said on -- or
3 the sheriff said on Coolhand Luke, "What we've got here is
4 a ill-formed and non-heterogeneous problem to meet." And
5 so I think we have a long way to go to try to pull all
6 these different tendencies that have been unleashed by a
7 variety of different decision making processes to gather
8 and figure out which or how they work together to help us
9 reach our energy goals.

10 Clearly, nobody here thought that the other
11 proposals was the correct one. So I think that we didn't
12 have a basis to exclude anybody from consideration based on
13 what we heard here. However, it seems like we are going to
14 have to make some changes to be able to continue to make a
15 path towards our greenhouse gas goals, continue to achieve
16 reliability, provide some cost effectiveness in this
17 system. And to be able to allow customer choice at the
18 same time that we provide universal access and
19 affordability. Tough to hit all those markers, tough to do
20 that with all these different models competing against each
21 other.

22 So I think our next steps is we're going to
23 consolidate the record. We'll probably look a little bit
24 at where some of these questions are already contained in
25 our existing proceedings. So we have PCIA and other issues

1 that will come before us at the CPUC. We're working with
2 the CEC on what the nature of the integrated resource
3 portfolio is, both for all the regulated load serving
4 entities including CCAs and what will happen in the
5 publicly owned utilities.

6 I think that we will have to continue to think
7 about how we actually structure energy efficiency programs
8 to help people reduce electricity. I think there are a
9 gazillion other questions that came up today, but we will
10 probably start to have to really examine the current
11 business models that are before us to figure out whether
12 there's incompatibilities or whether there's risk to
13 achieving our goals.

14 So thank you very much. (Applause.)

15 (The En Banc was adjourned at 4:59 P.M.)

REPORTER'S CERTIFICATE

I do hereby certify that the testimony in the foregoing hearing was taken at the time and place therein stated; that the testimony of said witnesses were reported by me, a certified electronic court reporter and a disinterested person, and was under my supervision thereafter transcribed into typewriting.

And I further certify that I am not of counsel or attorney for either or any of the parties to said hearing nor in any way interested in the outcome of the cause named in said caption.

IN WITNESS WHEREOF, I have hereunto set my hand this 7th day of May, 2017.
