ABSTRACT

The *Building Initiative for Low-Emissions Development Program Implementation Plan* presents California Energy Commission staff's proposed approach to administering the Building Initiative for Low-Emissions Development Program and is subject to further revision following review by the California Public Utilities Commission and additional public input. The Build Implementation Plan provides information on the anticipated requirements for program participation including: program eligibility, incentive structure, application process, eligible equipment, evaluation of new technology, bill savings calculation methodology, technical assistance and outreach, and the metrics to evaluate program performance.

Keywords: SB 1477, Decarbonization, BUILD Program, Heat Pump, Low-Income

EXECUTIVE SUMMARY

In 2018, Senate Bill 1477 (Stern, Chapter 378, Statutes 2018) authorized two building decarbonization programs: (1) Building Initiative for Low-Emissions Development Program, and (2) Technology and Equipment for Clean Heating Initiative. These two programs encourage the development and installation of near-zero-emission building technologies to reduce the emissions of greenhouse gases (GHG) from buildings, as buildings contribute to a quarter of California's GHG emissions. Among other things, Senate Bill 1477 requires the California Public Utilities Commission (CPUC), in consultation with the California Energy Commission (CEC) to develop and supervise the administration of the Building Initiative for Low-Emissions Development Program. The Building Initiative for Low-Emissions Development Program aims to encourage the design and construction of low-emission, energy efficient buildings, with co-benefits that include reduced energy utility bills for low-income occupants and improved comfort, safety, and indoor air quality.

In January 2019, the CPUC instituted a new rulemaking on building decarbonization (Rulemaking (R.) 19-01-011). The proposed scope of the rulemaking includes implementing Senate Bill 1477. Under this proceeding, the CPUC adopted Decision (D.) 20-03-027, on March 26, 2020, to further establish a framework and requirements for both programs authorized by Senate Bill 1477. D. 20-03-027 further designated the CEC as program administrator for the Building Initiative for Low-Emissions Development Program and as program administrator develop an implementation plan for approval by the CPUC. The BUILD Implementation Plan is subject to update and approval by the CPUC every two years. The BUILD Implementation Plan must address all requirements of Senate Bill 1477 and CPUC D. 20-03-027.

The BUILD Implementation Plan presents CEC staff's proposed approach to administering the Building Initiative for Low-Emissions Development Program and is subject to further revision following review by the CPUC and additional public input. The BUILD Implementation Plan provides information on the anticipated requirements for program participation including: program eligibility, incentive structure, application process, eligible equipment, evaluation of new technology, bill savings calculation methodology, technical assistance and outreach, and the metrics to evaluate program performance.

The BUILD Implementation Plan outlines a simplified program structure to encourage participation while still meeting requirements in the statute and D. 20-03-027. CEC staff have proposed flexible paths for the program while still encouraging energy efficiencies, a streamlined application process and an incentive structure option that will not require additional project modelling, and upfront technical assistance for builders and developers.

The BUILD Implementation Plan serves as framing document for the development of proposed program guidelines, which the CEC will develop and submit to the CPUC in early 2021. Specific provisions within the BUILD Implementation Plan may change as proposed program guidelines are developed, and CEC staff furthers program development analysis, solicits additional stakeholder input, and consults with the CPUC.

CHAPTER 1:

Introduction and Background

In 2018, Senate Bill 1477 (Stern, Chapter 378, Statutes 2018; SB 1477) authorized two building decarbonization programs: (1) Building Initiative for Low-Emissions Development Program (BUILD), and (2) Technology and Equipment for Clean Heating Initiative (TECH). These two programs encourage the development and deployment of near-zero-emission building technologies to reduce GHG emissions from buildings, as buildings contribute to a quarter of California's GHG emissions while also causing indoor and outdoor pollution. SB 1477 requires the CPUC, in consultation with the CEC to develop and supervise the administration of the Building Initiative for Low-Emissions Development Program. SB 1477 makes available \$50 million annually for four years, for a total of \$200 million, derived from the revenue generated from the GHG emission allowances directly allocated to gas corporations and consigned to auction as part of the California Air Resources Board's (CARB's) Cap-and-Trade program for the implementation of both pilot programs, BUILD and TECH.

In January 2019, the CPUC instituted a new rulemaking on building decarbonization (R.19-01-011). The proposed scope of the rulemaking includes implementing Senate Bill 1477. Under this proceeding, the CPUC adopted D. 20-03-027, on March 26, 2020, to further establish a framework and requirements for both programs authorized by Senate Bill 1477.

The BUILD Program, codified under Public Utilities Code Sections 921 and 921.1, will provide incentives for the installation of near-zero building technologies in new residential buildings that reduce GHG emissions significantly beyond what otherwise would be expected to result from the implementation of the prescriptive standards described in Part 6 of Title 24 of the California Code of Regulations (California Energy Code). SB 1477 places specific programmatic emphasis on "new, low-income residential housing" by requiring no less than 30 percent of the total funding be reserved for such projects. SB 1477 also requires that new low-income, residential building projects must be offered technical assistance, and that efforts to electrify these homes not result in higher utility bills for the occupants. SB 1477 additionally authorizes the development of proposed program guidelines to include program eligibility and evaluation requirements and enumerates certain project requirements and minimum metrics to be included in program evaluation.

The BUILD Implementation Plan is intended to serve as a broad outline of the CEC's proposed design for the BUILD Program. The CEC, consistent with SB 1477, anticipates continuing collaboration with CPUC, developing opportunities for additional public input, and the future release of more detailed proposed program guidelines prior to accepting new applications.

Staff hosted a joint CEC/CPUC public workshop on June 15, 2020, to present implementation options and solicit stakeholder feedback. Public comments on that workshop can be found in Docket [20-DECARB-01](#).

Initial Budget

Program funding is authorized pursuant to SB 1477 with an overall budget of \$200 million dollars. Funding accrues over a four-year period, from Fiscal Year (FY) 2019-2020 to FY 2022-2023. D. 20-03-027 provided specific allocations and more details budget allocations for each of the two programs. D. 20-03-027 appropriates 40 percent of the \$200 million budget for the BUILD Program equal to a total of \$80 million.

The overall program budget may be spent over the duration of the program; however, to meet requirements of the funding source each year's accrual must be expended within 10 years of allocation. There is no specific restriction on annual spending, provided it is within the overall budget and funds are available. The BUILD budget detail is shown in Table 1.1.

Table 1.1 BUILD Program Budget

Budget Item	Amount
Program Costs (direct incentives for low-income housing projects)	\$60,000,000 (no less than)
BUILD Program Costs (Other, including 3 rd party technical assistance provider for low-income)	\$10,000,000 (no less than)
Administrative Costs	\$8,000,000 (no more than)
Joint Evaluation Cost Share	\$2,000,000 (no more than)
Total	\$80,000,000

Source: CPUC D. 20-03-027¹

The \$10 million allocated for other BUILD Program costs will be prioritized for the third-party technical assistance provider. The exact budget for the technical assistance has not yet been established, as the request for proposal is currently in development (see Chapter 7 for more detail). The CEC will identify other programmatic uses for potential leftover funds in proposed program guidelines.

To comply with CARB rules regarding Cap-and-Trade funds, spending for the BUILD Program must be proportionally directed to the gas corporation service territories where the funds are derived. The percentage allocation for pilot program spending in each gas corporation service territory shall be consistent with each gas corporation's allocation of Cap-and-Trade allowances, as shown in Table 1.2.

1 [CPUC D. 20-03-027](http://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF), <http://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF>

Table 1.2 BUILD Program Budget Allocation by Natural Gas Territory

Natural Gas Utility Territory	Allocated Percent of Budget
Southern California Gas Company	49.26%
Pacific Gas and Electric Company	42.34%
San Diego Gas & Electric Company	6.77%
Southwest Gas Corporation	1.63%

As noted in D. 20-03-027:

“Any spending for the BUILD Program...with statewide or cross-territory benefits, including but not limited to administrative and evaluation spending, shall be attributed to the gas corporation service territories in proportion to their original funding contributions. To the extent that there are unspent funds allocated for an individual gas corporation’s service territory, and no remaining applicants within that service territory, the remaining funds may be spent outside of that gas corporation’s service territory, starting two years after initial implementation. Any unspent funds remaining as of July 1, 2033, must be returned to the ratepayers of the respective gas corporations.”²

Implementation Plan Contents

D. 20-03-027 specifies requirements for the BUILD Implementation Plan, which must, at a minimum, address the following topics (chapter references are indicated):

- Program eligibility criteria (Chapter 2)
- Incentive structure (Chapter 3)
- Criteria for scoring and selecting projects (Chapter 4)
- List of eligible technologies (Chapter 5)
- Process for evaluating new technologies (Chapter 6)
- Bill savings methodology (Chapter 7)
- Technical assistance and outreach plan (Chapter 8)
- Process and set of metrics by which to evaluate program performance (Chapter 9)

² [CPUC D. 20-03-027](http://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF), pg 3, <http://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF>

CHAPTER 2:

Program Eligibility Criteria

BUILD applicants may either be building owners or builders/developers only. Consultants may apply on behalf of eligible applicants. Consultants will need to provide information regarding the eligible applicants and work with the eligible applicants to submit the proper paperwork.

Projects must meet the following eligibility criteria, as further described:

- New residential housing
- All-electric
- Low income building
- Eligible service territory

To be eligible for BUILD incentives, all required and eligible technologies must be installed in conjunction with³ the construction of a new residential building that is permanently fixed to the foundation. For eligible technologies, refer to Chapter 5 of this document.

CEC staff recognize that proposed program guidelines must also address stage(s) in the development process at which a project must apply for incentives to be eligible. For instance, if a project has already received a permit from a building department but not started construction, will that project be eligible for BUILD incentives. CEC staff are continuing to evaluate this matter, will seek additional input and will issue further guidance in proposed program guidelines approved consistent with SB 1477.

New Residential Building

New residential building is defined as one of the following:

1. A building that has never been used or occupied for any purpose;⁴ or
2. Any work, addition to, remodel, repair, renovation, or alteration of any building(s) or structure(s) when 50 percent or more of the exterior weight bearing walls are removed or demolished;⁵ or
3. An existing building repurposed for housing, whose original use was not residential.

Consistent with this requirement, eligible building types may include:

- Single-Family homes
- Duplexes

³ For an eligible technology to be considered installed "in conjunction with" the construction of a new residential building, an appliance must be installed prior to issuance of a certificate of occupancy.

⁴ Section 100.1 of Part 6 of Title 24 of the California Code of Regulations (California Energy Code).

⁵ Chapter 15.06.030 Section R202 of the California Residential Building Code.

- Triplexes
- Condominiums
- Multifamily buildings
- Mixed-use buildings (which includes residential occupancies)

Ineligible project types include:

- Projects that have installed eligible equipment more than six months before submitting an initial application to BUILD
- Commercial buildings
- Government buildings
- Agriculture projects
- Schools
- Churches
- Transient housing

All-Electric Requirement

D. 20-03-027 requires projects to be limited strictly to new residential projects that are all-electric and have no hookup to the gas distribution grid. To meet the all-electric requirement, the following criteria are proposed for projects that meet the statutory definition of new residential housing:

- New buildings that have never been used or occupied may not have gas distribution lines to the building from any main gas lines that preexisted construction of the project. To be eligible, new housing developments should exclude the construction of gas infrastructure entirely.
- For existing buildings that meet the new housing definition under the criteria for remodel, repair, renovation, or alteration of any building(s) or structure(s) when 50 percent or more of the exterior weight bearing walls are removed or demolished, or an existing building repurposed for housing that has existing gas lines prior to renovation or repurposing must remove and/or cap the gas lines leading to the structure(s). Existing building projects would need to take certain steps to show their commitment to going all-electric, prior to receiving technical assistance or applying for BUILD incentives. CEC staff intend to further define these requirements in the proposed program guidelines.

CEC staff note that D. 20-03-27 ordered that, “projects and installations in local government territories that have “reach” codes which surpass the California Energy Code – or any other state requirement – are not prohibited from participating in the BUILD Program or the TECH Initiative.” CEC staff propose to include projects in municipalities with requirements or preferences for all-electric new construction as eligible projects for BUILD incentives.

Low-Income Residential Housing Requirement

Per SB 1477 and D. 20-03-027, the majority of BUILD funding must be reserved for new low-income residential housing. CEC proposes to offer BUILD funds exclusively for low-income residential housing during the initial offering of funds. Expanding the applicant pools, including market-rate projects, will be considered and proposed through the biennial recurring BUILD Implementation Plan update required by D. 20-03-027. To qualify for BUILD funding, a project must meet the definition of low-income residential housing provided in SB 1477:

1. A multifamily residential building of at least two rental housing units that is operated to provide deed-restricted low-income residential housing⁶ and that meets one or both of the following conditions:
 - a. The property is located in a disadvantaged community⁷ or low-income community,⁸ or
 - b. At least 80 percent of the households living in the building have incomes at or below 60 percent of the area median income⁹
2. An individual low-income residence¹⁰ as described in subparagraph (C) of paragraph (3) of subdivision (a) of Section 2852 of the Public Utilities Code.

NOTE: Section 2852 (a)(3)(C) An individual residence sold at an affordable housing cost to a lower income household that is subject to a resale restriction or equity sharing agreement, for which the homeowner does not receive a greater share of equity than described in paragraph (2) of subdivision (c) of Section 65915 of the Government Code, with a public entity or nonprofit housing provider organized under Section 501(c)(3) of the Internal Revenue Code that has as its stated purpose in its articles of incorporation on file with the office of the Secretary of State to provide affordable housing to lower income households.

Proof of meeting the required criteria must be provided at the time of application. CEC staff anticipate that applicants can document that a project meets this requirement by providing documentation of participation in federal, state or local programs that ensure minimum low-income participation rates. Specific details will be further detailed in proposed program guidelines.

6 As described in clause (i) of subparagraph (A) of paragraph (3) of subdivision (a) of [Section 2852 of the Public Utilities Code](#)

7 A community identified as a disadvantaged community pursuant to [Section 39711 of the Health and Safety Code](#)

8 A census tract or equivalent geographic area defined by the United States Census Bureau in which at least 50 percent of households have an income less than 60 percent of the area median gross income

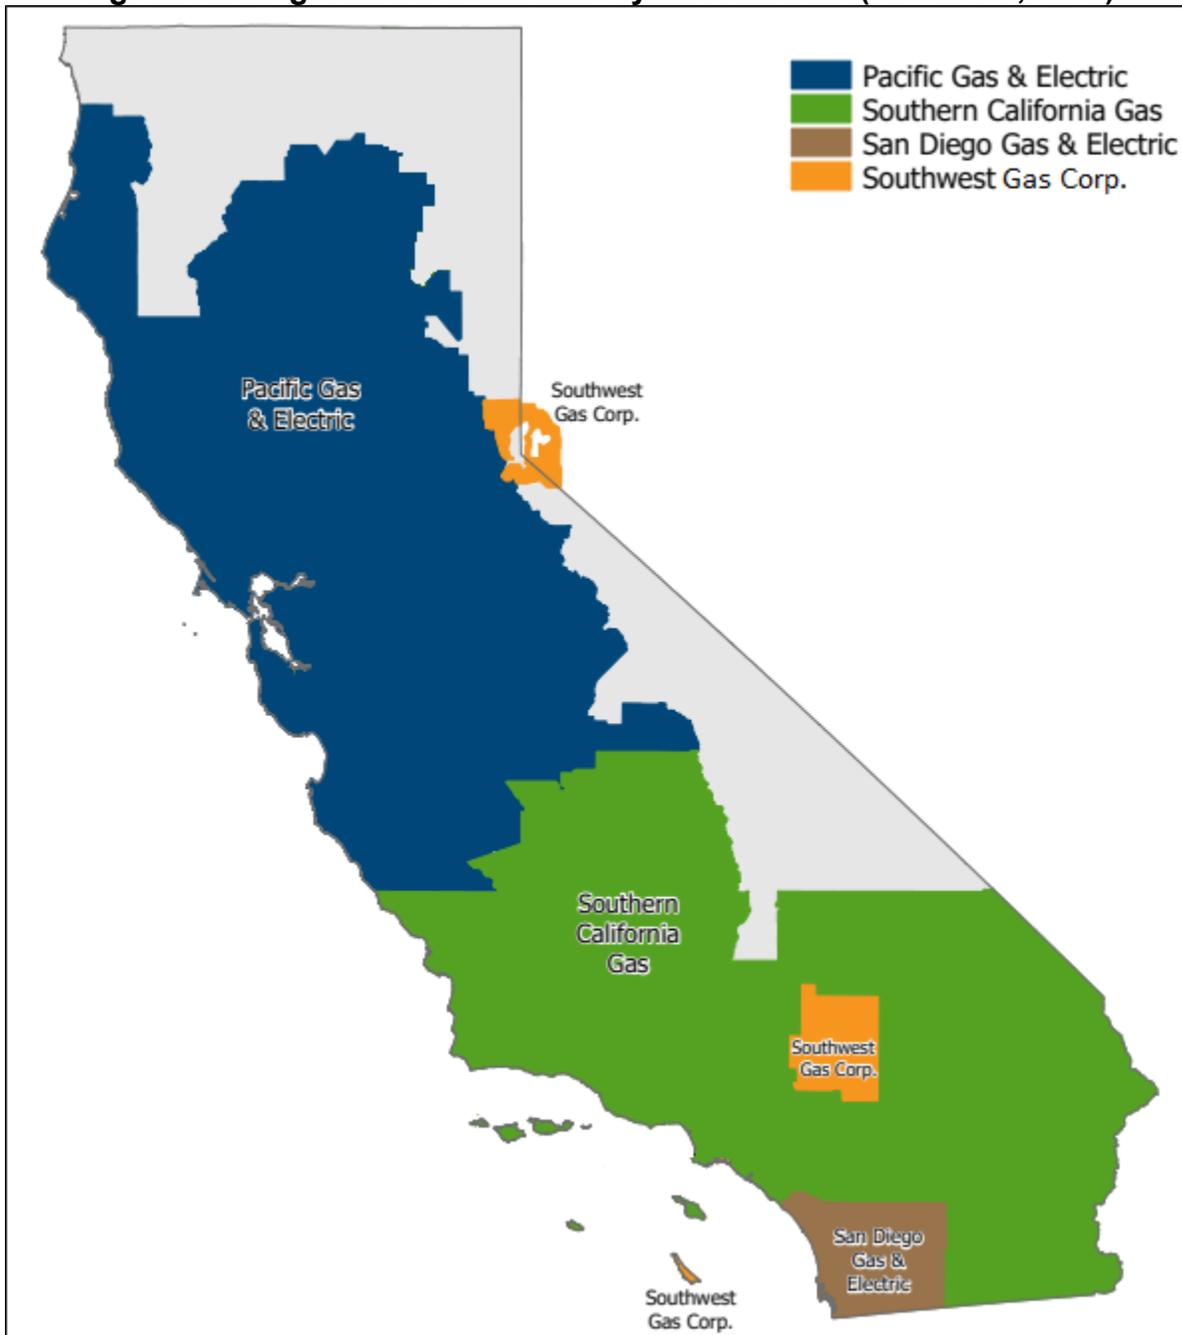

9 As defined in subdivision (f) of [Section 50052.5 of the Health and Safety Code](#)

10 As described in subparagraph (C) of paragraph (3) of subdivision (a) of [Section 2852 of the Public Utilities Code](#)

Eligible Service Territories Requirement

To comply with rules regarding the use of Cap-and-Trade funds realized from consignment of allowances to auction, spending for the BUILD Program shall be proportionally directed to the gas corporation service territories where the funds are derived. To receive incentives through the BUILD Program, the project must be located in California in one of the following gas corporation territories as shown in Figure 2.1.

Figure 2.1: Eligible Natural Gas Utility Service Area (California, 2020)

Source: California Energy Commission

Additionally, funds must be allocated in proportion to the percentage consistent with each gas corporations’ allocation of Cap-and-Trade allowances as listed in Table 2.1.

Table 2.1: Incentive Allocations for each Gas Corporation Territory

NG IOU Territory	Allocation Percentage	Statewide Expense Amount	Incentives Amount	Total Amount
Southern California Gas Company	49.26%	\$9,852,000	\$29,556,000	\$39,408,000
Pacific Gas and Electric Company	42.34%	\$8,468,000	\$25,404,000	\$33,872,000
San Diego Gas & Electric Company	6.77%	\$1,354,000	\$4,062,000	\$5,416,000
Southwest Gas Corporation	1.63%	\$326,000	\$978,000	\$1,304,000
Total	100%	\$20,000,000 (no less than)	\$60,000,000	\$80,000,000

Any spending for the BUILD Program with statewide or cross-territory benefits, including but not limited to administrative and evaluation spending, shall be attributed to the gas corporation service territories in proportion to their original funding contribution. To the extent that there are unspent GHG allowance proceeds allocated for an individual gas corporation’s service territory, and no remaining eligible projects within that service territory, the remaining GHG allowance proceeds may be spent outside of that gas corporation’s service territory, starting two years after implementation.

Any unspent funds remaining as of July 1, 2033, shall be returned to the ratepayers of the respective gas corporations.

D. 20-03-027 further notes that it is also appropriate to prioritize BUILD Program incentives toward the regions in the state with the highest potential for achieving program goals, including reducing GHG emissions and serving low-income customers. Incentive disbursement is also directed to include focus on specific climate zones of the state where there is a high cooling and high heating load, low-income residential housing, or specific building ages or types.

Energy Efficiency Requirements

Each building receiving incentives for installed technologies must comply with the applicable energy efficiency requirements pursuant to the California Energy Code¹¹ (Energy Code). As the BUILD Program will fund new construction projects only, buildings will be subject to the Energy Code. An apartment building with three or fewer habitable stories falls under the low-rise residential standards, while an apartment building that has more than three habitable stories falls under the nonresidential standards. For projects that are repurposed existing buildings whose original use was not residential, different energy efficiency requirements likely apply and must be met. As noted elsewhere, energy efficiency requirements under BUILD may change to reflect updates to the Energy Code.

Energy efficiency compliance shall be demonstrated for a building as a whole and cannot combine unrelated or detached buildings¹² consistent with the 2019 Energy Code or later applicable updates. Meeting the energy efficiency requirements by using the ‘addition only’ compliance approach or the ‘addition and alterations’ compliance approach will not be accepted. For more information, refer to Chapter 9 of the *2019 Title 24, Part 6, Residential Compliance Manual*.¹³

Questions concerning energy efficiency requirements should be directed to the Energy Code Hotline at title24@energy.ca.gov or 1-800-772-3300. Additional information can be found on the [Building Energy Efficiency Standards Web page](https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards) at <https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards>.

The BUILD energy efficiency requirements are determined by the Energy Code under which the project was permitted by the building department or local authority having jurisdiction. No additional energy efficiency requirements are proposed Applicants may also verify which Energy Code a project is subject to using the following dates:

- *2019 California Energy Code*: Building permit application(s) submitted to the building department on or after January 1, 2020.
- *2022 California Energy Code*: Building permit application(s) submitted to the building department on or after January 1, 2023.

11 [2019 Building Energy Efficiency Standards](https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2019-building-energy-efficiency), <https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2019-building-energy-efficiency>

12 The whole-building approach is defined in Section 8.6.1 of the [2019 Building Energy Efficiency Standards Residential Compliance Manual](https://ww2.energy.ca.gov/2018publications/CEC-400-2018-017/chapters/08-Performance_Method.pdf), https://ww2.energy.ca.gov/2018publications/CEC-400-2018-017/chapters/08-Performance_Method.pdf

13 [Energy Efficiency 2019 Residential Compliance Manual Chapter 9](https://ww2.energy.ca.gov/2018publications/CEC-400-2018-017/chapters/09-Additions_Alterations_and%20Repairs.pdf): https://ww2.energy.ca.gov/2018publications/CEC-400-2018-017/chapters/09-Additions_Alterations_and%20Repairs.pdf

CHAPTER 3:

Incentive Structure

Incentive Structure

D. 20-03-027 declined to dictate a specific incentive level, but, rather, provided the CEC the flexibility to establish and adjust incentive levels based on participation rates, market activity, costs, complementary programs, location, GHG savings, grid impacts, and program data. The CEC, when administering the BUILD Program incentives, will act consistently and tie incentives to the cost of equipment, incremental cost difference for builders, and estimated GHG emission reduction level with prioritization given to projects in low-income and disadvantaged communities, consistent with the requirements of D. 20-03-027.

Many stakeholders have presented compelling cases regarding the need for a simple participation model. In response, CEC staff recommend a simple incentive design that encourages participation and leverages the design, modeling and program participation efforts project developers already undertake. In addition, the first few years of this program is being implemented concurrently with development of the next update to the Energy Code. CEC staff will reflect the need for the BUILD program to address current versions of the Building Code over time in proposed program guidelines. CEC staff will also monitor the updates to the Building Code and, if necessary, appropriately reflect any new considerations and compliance requirements for all-electric residential construction in the required, recurring updates to the Implementation Plan. CEC staff seek to develop an incentive design applicable in the initial years that can both support new standards and also respond to changes without a major investment of resources in re-design that would divert funds from their best use.

CEC staff proposes a pre-determined rate of funding specific to each climate zone and building type and based on modeled annual avoided GHG emissions. The incentive rate will be set to a dollar amount that offsets the cost of equipment and incremental cost difference for builders to employ all-electric housing designs and adjusts to reflect the level of GHG reductions. This approach is consistent with the requirements of D. 20-03-027, that incentives shall be based on whole building GHG performance modeled using the CEC's California Energy Code Compliance (CBECC) software against a reference case.

Description of the Template-Based Incentive Structure

While incentive levels will be based on GHG emission reduction levels and incremental cost to builders, there are other BUILD Program requirements that will also determine and shape the incentive structure. BUILD is a GHG emission reduction program and incentives shall be based on whole building GHG performance. In addition, incentives set aside for low-income residential housing, representing most of the BUILD Program budget, must not result in higher utility bills for building occupants. There must also be a list of eligible technologies in the proposed program guidelines.

Instead of setting up multiple checkpoints for BUILD Program applicants, which might include performing and submitting building energy modeling results, CEC staff will complete upfront analysis to make sure these statutory and regulatory requirements are met and embedded within the BUILD Program incentive structure.

The incentive structure and list of eligible technologies will be presented as a prescriptive template, tailored to each climate zone and specific to each building type. This template will list the building design criteria required to receive incentives through the BUILD Program and will be a list of requirements that will ensure energy bill savings. In order for a project to receive BUILD Program funds, it will need to meet or exceed the template’s design criteria (which in turn will likely exceed prescriptive Energy Code criteria).

The templates will list the required technologies an applicant must include in their building design, such as a minimum heat pump efficiency and minimum R-value insulation, and offer a dollar incentive amount on the unit or bedroom level for multifamily buildings and conditioned floor area (CFA) for single family buildings. The template presents the list of eligible technologies, bases incentives on whole building GHG performance, and ensures bill savings for building occupants without requiring any extra analysis or building modeling of the BUILD Program applicant. There may be a differing template and incentive level for each building type and each climate zone or region. See Table 3.1 below as an example of the BUILD Program incentive structure.

Table 3.1 Sample BUILD Program Incentive Structure

Climate Region	1-story Single Family	Low-Rise Multifamily	High-Rise Multifamily	Mixed Use
North & Central Coast (Climate Zones 1-5)	\$/CFA	\$/bedroom	\$/bedroom	\$/bedroom
South Coast (Climate Zones 6-10)	\$/CFA	\$/bedroom	\$/bedroom	\$/bedroom
Central Valley (Climate Zones 11-14)	\$/CFA	\$/bedroom	\$/bedroom	\$/bedroom
Southern Desert (Climate Zone 15)	\$/CFA	\$/bedroom	\$/bedroom	\$/bedroom
Mountains (Climate Zone 16)	\$/CFA	\$/bedroom	\$/bedroom	\$/bedroom

In public comments to the BUILD Program workshop, many stakeholders emphasized the need for program simplicity, especially from the perspective of the applicant. A prescriptive template is intended to promote a streamlined and simple program participation experience by developing scalable templates to use as a basis for calculating GHG emissions reductions and

incentives. The intent is to develop a standardized incentive in a dollar-per-bedroom or dollar-per-dwelling-unit rate that is based on avoided GHG performance and generated from standardized modeling and analysis. This approach will tailor the template of prescriptive efficiency measures by climate zone and utility jurisdiction. Using the prescriptive template approach, a program participant would not be required to model their building design specifically for BUILD participation and would simply need to meet basic minimum requirements then likely select the suite of applicable inputs into a BUILD Program calculator or other tool to identify a project's potential incentive amount. At this time CEC staff do not propose limiting or capping total incentive funding for a given project, nor does staff propose limiting total funding to a given developer or developing entity applying to BUILD across multiple applications. Staff are interested in additional public input as proposed program guidelines are developed and may consider funding caps for individual projects.

This type of upfront analysis by CEC staff will meet statutory program requirements, without complicating participation. Also, this incentive structures allows potential BUILD Program applicants to quickly calculate the estimated incentive amount they can receive, before doing any costly modeling. This is especially important for low-income developers, as they need to secure project funding in the pre-development phase of the project, before applying for tax credits through TCAC, and before building design is final. This timing is important, as BUILD Program incentives are meant to influence building design decisions.

Developing the Incentive Templates

CEC staff will use CBECC software to set the BUILD Program incentive structure template. A 2019 Energy Code prescriptive mixed fuel building will be used to calculate the baseline energy use and GHG emissions for each building type and in each climate zone. As the Energy Code is updated for the 2022 code cycle, the incentive structure template for the BUILD Program will be updated as needed, both for the GHG emission calculation and the bill savings analysis.

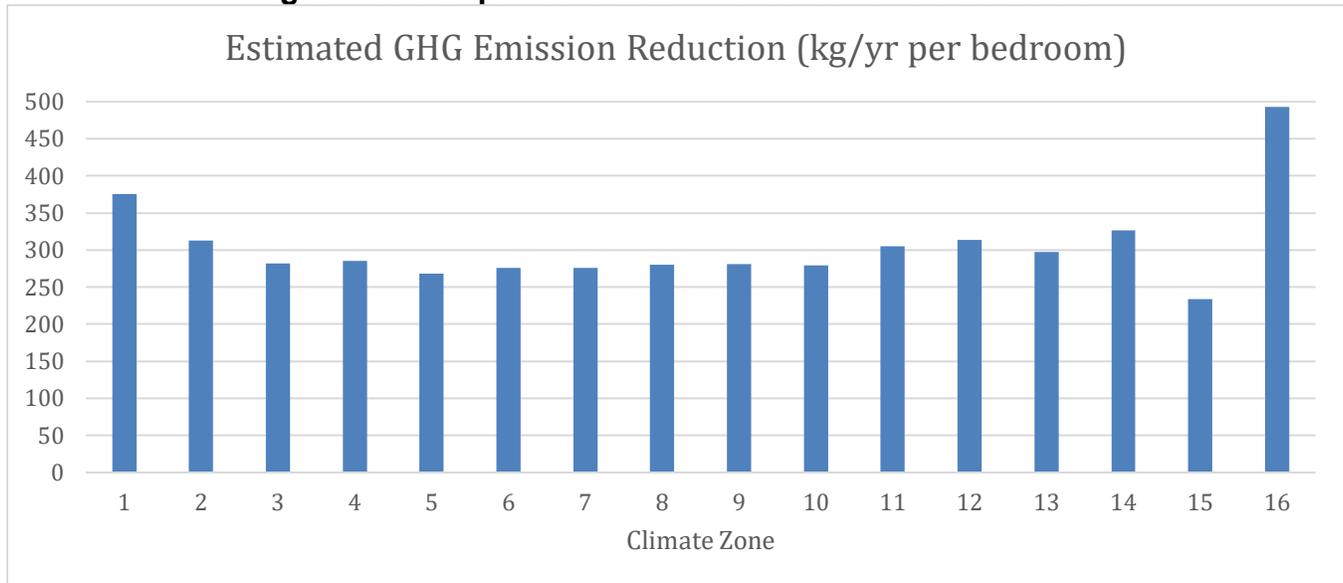

GHG Emission Calculation

The GHG emission reduction calculation for projects funded with BUILD Program incentives will be based on whole building performance. CBECC software estimates GHG emissions of modeled buildings in CO₂ equivalent emissions per year. The CBECC emissions calculation includes site fuel emissions, mainly the combustion of natural gas from space and water heating, and emissions associated with the generation of electricity. To calculate emission reductions, the all-electric modeled building emissions are compared to 2019 mixed-fuel prescriptive building emissions baseline. This baseline will be updated as appropriate based on 2022 updates to Title 24 and CBECC software and potentially future updates as needed.

Staff will model the all-electric buildings template and compare the annual GHG emissions to the mixed-fuel baseline. The GHG emission reductions of each template will inform the incentive level for that building type and climate zone. Heating and cooling loads vary by climate zone, which leads to varied energy use, and varied GHG emission reductions. Figure 3.1 below is a sample of the varied GHG emission reductions based on a sample all-electric low-rise multifamily building compared to a mixed-fuel low-rise multifamily building. Once the

template of eligible technologies is determined, a GHG emission analysis will be done for each building type and climate zone.

Figure 3.1 Sample GHG Emission Reduction Calculation

The GHG emission reduction calculation will be used as a basis for the incentive structure and a factor in incentive levels and will be reported as part of program evaluation. Regulatory and statutory requirements include reporting of total avoided GHG emissions and cost per metric ton of avoided GHG emissions. (See Chapter 9 for more information on BUILD Program metrics.)

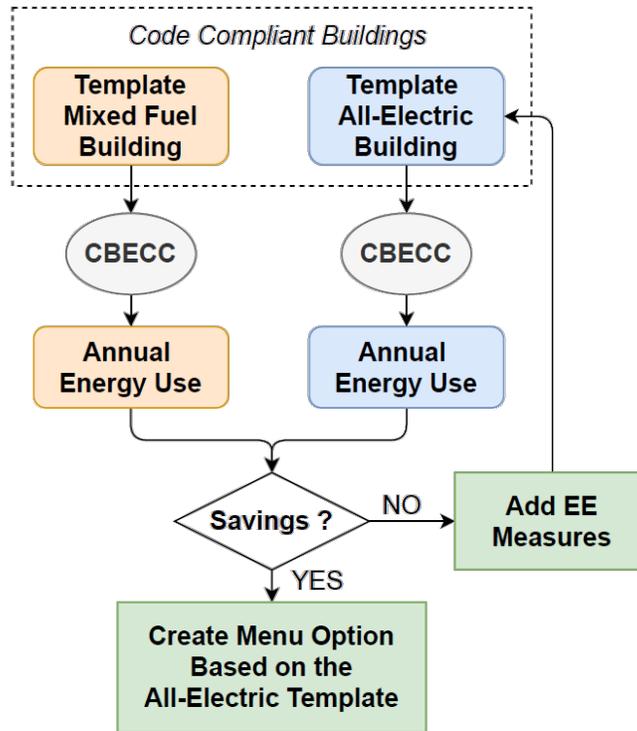

CEC staff may do further analysis to determine lifetime GHG emission reductions of BUILD projects. This analysis would include incorporating projected GHG emissions attributed to the generation of electricity. Because of California’s increasing adoption of renewable energy, the GHG emissions attributed to electricity provided by the grid will reduce over time. The lifetime GHG emission reductions will be analyzed on a 30-year term, which is consistent with the lifecycle analysis of a residential building under codes and standards. Lifetime GHG emissions may also be analyzed under a 15-year term to compare emissions reductions to bill savings using the same time basis. (See Chapter 6 for more information on the bill savings methodology.)

Energy Bill Savings Calculation

As the BUILD Program has mutual goals of GHG emission reduction and bill savings, staff anticipate that project developers will need to evaluate which combination of technologies provides sufficient to meet these goals. The bill savings of a project is significantly affected by local utility rates and may be specific to certain service territories. As such, staff may iterate additional templates for added bill savings measures in some areas. In such cases, the baseline energy use will be applied to natural gas and electricity rates to calculate a baseline estimate of an energy bill. These baseline building templates will be set and constant for each building type and climate zone. CEC staff will then model templates for all-electric buildings,

for each building type and in each climate zone, to determine which template of energy-efficient and low-emission building technologies are anticipated to result in energy bill savings. There will likely be multiple templates of different combinations of building technologies in each climate zone before the templates are optimized and completed. Figure 3.2 is a flow chart of this process. By doing this analysis, CEC staff eliminates the need for BUILD Program applicants to each do their own analysis. See Chapter 7 for additional information on the bill savings methodology.

Figure 3.2 Incentive Structure Development Flow Chart

CEC staff propose that a project must meet the template minimum requirements to receive BUILD incentives. The template may differ by building type and climate zone, and consequently, may result in different levels of GHG emissions reductions and incentive levels.

Table 3.2 is a sample of the eligible technologies that would serve as the basis of a BUILD Program template.

Table 3.2 Sample Eligible Technologies Template

Building Type: Low-Rise Multifamily
Climate Zone(s): 6, 8, 9
Heat Pump HVAC, HSPF \geq 9.0
Heat Pump Water Heater, NEEA Tier 3 OR Central Heat Pump Water Heater, approved in CBECC Software
Minimum 2019 Energy Code prescriptive envelope measures

CEC staff further propose that a project applying for incentives calculated under the prescriptive incentive approach would still be eligible to receive kicker incentives as described next.

Kicker Incentives

For building design features that are additional to those considered in the pre-determined modeled base incentive rate values and represent additional GHG emission reductions, staff propose a small suite of 'kicker' incentives, offered at a flat rate for specific design features on top of prescriptive or modeled incentive levels. At minimum, a project eligible for BUILD Program kicker incentives must include all mandatory base level eligible technologies. If a project includes all the base level eligible technologies, it may qualify for additional BUILD incentives by including technologies eligible for BUILD kicker incentives. CEC staff currently propose that if a project uses a technology for compliance credit under the Energy Code, the technology will not be eligible for BUILD kicker incentives. However, staff also recognize that in some cases limiting eligibility could be contrary to other policies supporting adoption of

beneficial technologies. CEC staff will continue to explore these considerations and will provide final guidance on eligibility in the proposed program guidelines.

Table 3.3 shows examples of kicker incentive levels for the BUILD kicker incentive technologies. The rates shown are for example purposes only. Final and applicable incentive amounts will be made available in proposed program guidelines.

Table 3.3: Sample BUILD Kicker Incentive Levels (example values only, final values may change)

Performance "Kicker"	Incentive Level
Grid Flexibility	\$500/grid flexible capable system
Low-GWP Refrigerants	\$1,000/heat pump water heater \$1,000/heat pump HVAC system
Induction Cooktop	\$300/induction cooktop unit
Heat Pump Clothes Dryer	\$150/heat pump clothes dryer
On-Site Energy Storage	\$50/ton annual avoided GHG emissions OR \$X/MWh storage capacity

CHAPTER 4:

Required and Eligible Technologies

The BUILD Program aims to encourage the design and construction of low-emission, energy efficient buildings, with co-benefits that include reduced energy utility bills for the occupants and improved comfort, safety, and indoor air quality. As stated in D. 20-03-027, there is no restriction for the BUILD Program to incent a specific technology or measure. Instead, incentives should be provided for any combination of technologies, including but not limited to energy efficiency and demand response measures, electric battery storage, and other measures and technologies. CEC staff currently propose that incentives support the installation of technologies beyond what is required for compliance with the Energy Code but seek additional input on this proposed approach. The CEC may consider additional technologies for incentives, such as solar water heaters, electric vehicle charging equipment, or building envelope measures, under proposed program guidelines pending additional analysis and stakeholder input.

All-electric building design with no gas hookup is a required minimum under D. 20-03-027 requirements for the BUILD Program. As such, technologies that use renewable natural gas or hydrogen will not be included in the BUILD Program. Please see Appendix A for the equipment lists the CEC plans to use for each technology type under the BUILD Program.

BUILD Base Incentives

The CEC will calculate base incentives using CBECC software, based on design factors and technologies used to determine energy consumption and GHG emission levels. Consistent with the authorizing statute, the BUILD Program will incent a combination of technologies and measures, addressing but not limited to energy efficiency, space conditioning, water heating, cooking and laundry needs.

Table 4.1: Technologies for BUILD Base Incentives

Energy End Use	Core Technologies	Minimum Requirements
Space Conditioning	Heat Pump HVAC	HSPF ≥ 10 (non-ducted) HSPF ≥ 9 (ducted)
Water Heating	Heat Pump Water Heater	NEEA Tier 3
	Central Heat Pump Water Heater	Approval in CBECC software

Heat Pump Space Conditioning

During the heating season, heat pumps move heat from outside into the home; during the cooling season, heat pumps run in reverse, moving heat from the home to the outdoors. Electric heat pumps substitute gas furnaces, and are a low-emission technology, eliminating the need for on-site combustion of natural gas for space heating, and therefore reducing GHG emissions. For space conditioning, heat pumps must have a heating seasonal performance factor (HSPF) of 10 or higher for non-ducted systems and 9 or higher for ducted systems to be eligible for BUILD incentives. HSPF is used to measure the efficiency of air source heat pumps. It is defined as the ratio of heat output over the heating season to electricity use, the higher the HSPF, the less energy the heat pump uses to heat the building. The seasonal energy efficiency ratio (SEER) is the ratio of the total heat removed from the conditioned space during the cooling season divided by the total electrical energy consumed during that season. The higher the SEER rating, the less energy the heat pump uses to cool the building. Even higher HSPF or SEER ratings may be required of heat pump space conditioners in certain climate zones depending on bill savings analysis for a particular climate zone.

Water Heating

Heat pump water heaters use electricity to move heat from one source (typically ambient air) to water instead of using an electric resistance element. Because of this, they can be more than three times as energy efficient than conventional electric resistance water heaters. They are also low-emission compared to gas water heaters by avoiding on-site combustion of natural gas. In order to meet the cost-savings and carbon reduction goals, heat pump water heaters used to develop templates under the BUILD Program include those meeting the Northwest Energy Efficiency Alliance (NEEA) Tier 3 criteria for residential electric advanced water heating specifications.¹⁴ Eligible central heat pump water heaters will need to be approved in the CBECC software. A NEEA Tier 4 or higher heat pump water heater may be required in certain climate zones depending on the bill savings analysis.

BUILD Kicker Incentives

Kicker incentives under the BUILD Program are additional incentives available to offset the costs of additional or more advanced technology and costs borne by the developer to support electrification that are not captured in the base incentive calculation. The additions to projects must contribute to additional GHG emissions reductions beyond the level used to calculate the BUILD base incentive technologies. CEC staff also currently propose that kicker incentives not be provided for technologies that are otherwise used to meet Energy Code compliance. Final guidance on the requirements for kicker incentives, potentially by technology type, will be provided in the proposed program guidelines.

¹⁴ [NEEA Advanced Water Heating Specification](https://neea.org/img/documents/Advanced-Water-Heating-Specification.pdf), <https://neea.org/img/documents/Advanced-Water-Heating-Specification.pdf>

The technologies currently proposed as eligible for the kicker incentives, listed in Table 4.2, offer advanced energy efficiency or other GHG emissions reductions, grid flexible capability, additional renewable energy generation, or storage. The kicker incentives will be offered at a different level or unit compared to base incentives.

Table 4.2: Eligible Technologies for BUILD Kicker Incentives

Eligible Technologies	Minimum Requirement
Demand Response Capabilities	CTA-2045 compliant or other open source compliance standards; For heat pump water heaters, JA 13 compliant
Refrigerant	GWP < 750
Induction Cooktop	No prescriptive performance standard
Clothes Dryer	Heat pump clothes dryer
Battery Storage System	Listed on the Solar Equipment Lists and JA 12 Compliant

Demand Response/Load Flexibility

Heat pump water heaters have the capability to provide load flexibility; the electricity consumption of heat pump water heaters can be scheduled or adjusted to match times of high supply of renewable energy. In this way, heat pump water heaters can act as a battery, loading and storing thermal energy when it is beneficial to the electric grid. Heat pump water heaters with grid flexibility capabilities may be eligible for kicker incentives. These heat pump water heaters comply with 2019 Title 24 Part 6 Joint Appendix JA13¹⁵ on Water Heater Demand Management. They must also comply with CTA-2045 or other open source compliance standards. As noted above and consistent with other technologies, CEC staff propose that if a project uses heat pump water heaters for compliance credit under the Energy Code, the technology will not be eligible for BUILD kicker incentives. CEC staff will continue to explore these considerations with public input and will provide final guidance on eligibility in the proposed program guidelines.

On July 8, 2020, the CEC adopted JA13. The JA13 specifications for water heater demand management includes system components, safety requirements, minimum energy efficiency performance, and control requirements. The control requirements, or demand management functionality, must have the ability for: basic load up, advanced load up, return to standard operation, light shed, deep shed, and full shed. These functionalities allow the heat pump water heater to communicate and react to real-time price signals and other grid metrics, to optimize operation for demand management while ensuring sufficient hot water supply.

“CTA-2045” refers to a specification published by the Consumer Technology Association (CTA) and dual-listed by the American National Standards Institute (ANSI). From 2008 through 2012,

¹⁵ [Joint Appendix 13](https://efiling.energy.ca.gov/GetDocument.aspx?tn=227876&DocumentContentId=59256), <https://efiling.energy.ca.gov/GetDocument.aspx?tn=227876&DocumentContentId=59256>

this national standard was created through a collaborative effort by the Electric Power Research Institute (EPRI), the Smart Grid Interoperability Panel (SGIP), manufacturers, utilities, and several standards experts from the high-tech industry. The CTA-2045 communications port is analogous in concept to a USB socket on a camera, television, or computer, but this socket is specifically designed for appliances. The most important purpose of the standard is to define how to pass information from a universal communication module to the smart grid device (SGD) or appliance. The socket enables external communication and puts the customer in charge of how communication links to their appliances will occur.

Additional grid flexibility technologies may be considered for kicker incentives in the proposed program guidelines.

Low-GWP Refrigerants

Heat pump systems transfer heat using a refrigerant. Systems using a refrigerant have associated GHG emissions either through annual leakage, or end-of-life leakage. Conventional refrigerants typically have high global warming potential (GWP) values, around 1,500-2,000, which contributes to GHG emissions. Encouraging the use of low-GWP refrigerants in heat pump systems is part of the State's overall decarbonization goal.

Reducing refrigerant-based GHG emissions has some of the greatest potential to reduce GHG emissions in California and lower GWP refrigerants will further the objectives of SB 1477 to promote emerging building decarbonization technologies and strategies. As stated in D. 20-03-027, in determining kicker incentives relating to refrigerant usage, the CEC may provide for tiered incentives that differentiate between space and water heating equipment that use low-GWP refrigerants and space and water heating equipment that use mid-range GWP refrigerants.¹⁶ CPUC defines "high-GWP" refrigerants as refrigerants with a GWP above 750, consistent with CARB's recent regulatory proposal for new stationary air conditioning systems starting January 1, 2023.

CEC staff propose that heat pump systems using refrigerants with a global warming potential below 750 will qualify for kicker incentives. These criteria may change in revisions to the BUILD Implementation Plan, as rulemaking through the California Air Resources Board may require low GWP refrigerants in heat pump air conditioning systems.

Cooking and Laundry Needs

If the builder/developer provides cooking and laundry appliances, which is common in low-income multifamily housing, ultra-efficient appliances will be eligible for BUILD kicker incentives. Only the highest performing appliances will be considered for kickers. CEC staff will determine the appropriate performance threshold or Energy Star®¹⁷ rating in proposed program guidelines. Staff is considering induction cooking and heat pump clothes dryers for BUILD kicker incentives.

¹⁶ [D. 20-03-027](https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF), pg 68, <https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M331/K772/331772660.PDF>

¹⁷ [Energy Star Website](https://www.energystar.gov/), <https://www.energystar.gov/>

Induction cooking is one of the most efficient cooking technologies. With this technology, up to 90 percent of the energy consumed is transferred to the food, compared to about 74 percent for traditional electric systems, and 40 percent for gas.¹⁸ Induction cooktops use an electromagnetic field below a glass surface to transfer current directly to magnetic cookware, causing it to heat up. Induction also cooks faster and offers superior temperature control.

Heat pump clothes dryers are a type of condensing dryer. The moisture from the damp clothes condense on the cold coil of the heat pump, and the condensed water is discharged into a drainpipe. Because they utilize heat pump technology, these clothes dryers are among the most energy efficient on the market. Many clothes dryers on the Energy Star Most Efficient¹⁹ list are heat pump dryers. Products that make the Energy Star Most Efficient list deliver cutting edge energy efficiency along with the latest technology innovation. They represent the year's best for energy savings and environmental protection.

On-Site Energy Storage

The benefits of onsite solar photovoltaic (PV) generation can be maximized by pairing the system with battery storage. Furthermore, storing energy can further reduce grid dependence and GHG-emissions by load shifting and providing grid harmonization.

CEC staff propose that battery storage be eligible for kicker incentives if paired with PV generation. CEC staff currently propose that if a project uses a technology or a portion of installed technology for compliance credit under the Energy Code, the technology will not be eligible for BUILD kicker incentives. However, staff also recognizes that in some cases, such as energy storage, limiting eligibility could be contrary to the other policies supporting adoption of beneficial technologies. CEC staff will continue to explore these considerations and will provide final guidance on eligibility in the proposed program guidelines.

Battery storage technologies, batteries or energy storage systems, must also be listed on the CEC's Solar Equipment Lists. The system must comply with the 2019 Title 24 Part 6 Joint Appendix 12 (JA12,)²⁰ Qualification Requirements for Battery Storage System.

Alignment with other Incentives

The CEC recognizes that several programs are currently being implemented or developed by a range of agencies to address building decarbonization. The CPUC conducted a workshop in June 2020, to consider the need for layering incentives to achieve complementary programs and ensure funds support identified needs most appropriately. As the CEC collaborates with the CPUC and the public to further develop proposed program requirements, , the CEC will seek to address the layering of incentives and identify specific areas of the BUILD program

20 [Joint Appendix 12](https://ww2.energy.ca.gov/2018publications/CEC-400-2018-021/CEC-400-2018-021-CMF.pdf#page=209&zoom=100,0,0), <https://ww2.energy.ca.gov/2018publications/CEC-400-2018-021/CEC-400-2018-021-CMF.pdf#page=209&zoom=100,0,0>

that may need to be updated including additional kicker incentives or alterations to the existing incentive structure. Following initial program implementation, the CEC will also continue to monitor overlap between BUILD base and kicker incentives and other incentive programs in the state and propose changes to the CPUC when appropriate. CEC staff will also collaborate closely with the TECH Initiative and efforts to update the Building Code.

CHAPTER 5:

Process for Evaluating New Technologies

Process for Evaluating New Technology

SB 1477 requires the BUILD Program to develop a process for evaluating new technologies.

Technologies considered in the base incentive modeling and calculations under BUILD must be incorporated into the CBECC software. There are two existing processes for manufacturers to add their equipment to the CBECC software, during the standard three-year iterative Energy Code update process or the compliance process. The compliance process begins by working with CEC staff, and then eventually proceeding to a business meeting. This process will require a verification process that can take significant time and can be costly for manufacturers, but will provide assurance that the new technology is performing as expected.

If a technology cannot be incorporated into the CBECC software, the product will not be eligible under the basic incentive structure of the BUILD Program.

Certain new technologies that fit in the categories for kicker incentives will need to meet the minimum requirements and be listed on the technology specific lists as referenced in the kicker incentives section of the Build Implementation Plan and the appendix.

CEC staff anticipates the need for a new process to be developed for technologies that have not been verified or may not be able to be included in the CBECC model. Following enough program experience and information to identify the specific need for a new process, staff will consider evaluating technologies on a case-by-case basis and will need to understand the GHG reduction potentials, performance, and safety of the new technology. CEC staff may be able to rely on established industry processes and safety and performance certifications to evaluate new technology. However, staff must coordinate the integration of new technologies into the BUILD Program in alignment with the requirements and established processes of the Energy Code.

CEC staff will also identify additional opportunities to accomplish the goals of SB 1477 by coordinating efforts with the TECH Initiative program administrator as this program also has a requirement to develop a process for evaluating new technologies in space and water heating.

CHAPTER 6:

Bill Savings Methodology

Energy Bill Savings Methodology

SB 1477 directs the CPUC, in supervising the administration of the BUILD Program, to ensure that projects funded in new low-income residential buildings located in disadvantaged or low-income communities do not result in higher utility bills for building occupants.

D. 20-03-027 directs CEC to develop or adopt a tool or a methodology to measure bill savings as a result of the BUILD Program and to make changes to the tool based on the SB 1477 Program Evaluator's recommendations. Staff believes that existing available tools should meet the needs of the bill savings methodology, rather than necessitating the development of a new calculation tool.

This section describes the methodology CEC staff proposes to use to calculate bill savings for projects receiving incentives through the BUILD Program. The main goal of the Bill Savings Methodology is to accurately estimate expected utility bills for building occupants and will therefore need to be project-specific. The CEC staff methodology relies on the modeled estimate of the energy use of the designed building combined with the applicable utility rates to determine the expected energy bill.

To assist with design considerations, in cases where the expected combination of energy efficiency measures and new electric technologies does not indicate bill savings will also be accomplished, CEC staff can do upfront analysis using CBECC to determine what building performance criteria must be met to show utility bill savings. This analysis can include performance efficiencies of mechanical systems, additional PV generation beyond what is required in code, and building envelope performance. These performance criteria may differ in different climate zones.

Building Energy Modeling

CBECC is a free computer program developed by the CEC for demonstrating compliance with the Energy Code. CBECC takes inputs on building envelope and mechanical system design and calculates energy usage of the building. One output of CBECC consists of hourly energy use profiles, which are the estimated therms and kilowatt-hours used by the designed building each hour of a calendar year. By applying the therms to hourly natural gas utility rates, the natural gas bill can be calculated. Likewise, by applying the kilowatt-hours to hourly electric utility rates, the electric bill can be calculated. The combination of these bills forms total the energy bill which can be compared to evaluate bill savings.

Establishing the Baseline

The focus of the BUILD Program will be on new low-income housing, primarily in newly constructed buildings. Newly constructed buildings have no historical data for utility costs. To calculate bill savings, a baseline must be set for these projects. In the proposed methodology,

energy bills of a mixed-fuel building meeting the 2019 Energy Code prescriptive standards will be the baseline. This is consistent with the requirements for setting a GHG emissions baseline under the BUILD Program.

Defining Bill Savings

Under the BUILD Bill Savings Methodology, “bill savings” shall be defined as no energy utility (natural gas and electricity) bill increase. While savings can be assessed monthly, seasonally, or annually, staff proposes that an annual basis is reasonable.

Utility costs will be projected for a 15 year period, which is the general expected useful life of the building appliances. Also, usually after the initial 15 years of occupancy, deed-restricted affordable housing projects undergo tax credit resyndication, and multifamily owners closely examine and evaluate necessary major building improvements.

Rates

The California Alternative Rates for Energy (CARE)²¹ program offers qualifying low-income IOU customers a 30-35 percent discount on their electric rate and a 20% discount on their natural gas rate. Many POUs offer similar discounts to their qualifying low-income customers. It is fair to assume that tenants in low-income affordable housing buildings qualify for discounted energy utility rates. Therefore, the rates used in this bill saving methodology as proposed are the baseline CARE/low-income rates. CEC staff will consider other approaches for rates that may be used in the bill savings methodology and finalize the methodology in the proposed program guidelines.

Because the value of the utility rates is essential in the bill savings methodology, it is important that they be accurate. Utility rates can change, so there will need to be a process and schedule for updating the rates. For the bill savings methodology, CEC staff propose that the rates be updated every two years.

Rate Projections

To ensure bill savings out to 15 years, the analysis will need to include rate projections. CEC staff is researching published rate projections to determine which rate projections would be appropriate to use under the BUILD Program:

- The *Integrated Energy Policy Report (IEPR)*²² report contains an integrated assessment of major energy trends and issues facing California’s electricity, natural gas, and transportation fuel sectors. CEC uses rate projections in the demand forecast as part of the IEPR process. The rate projections for the demand forecast uses natural gas and carbon price scenarios, forecasts of retail sales, and scenarios on transmission and distribution revenue requirements. An updated rate forecast for the *2020 IEPR Update* demand forecast update will be available later this year.

21 [California Alternative Rates for Energy \(CARE\)](https://www.cpuc.ca.gov/lowincomerates/), <https://www.cpuc.ca.gov/lowincomerates/>

22 [Adopted 2019 Integrated Energy Policy Report](https://efiling.energy.ca.gov/getdocument.aspx?tn=232922), <https://efiling.energy.ca.gov/getdocument.aspx?tn=232922>

- The Energy and Environmental Economics (E3) report, *Residential Building Electrification in California: Consumer Economics, Greenhouse Gases and Grid Impacts*,²³ includes a study of consumer energy bills evaluated in six climate zones. This analysis includes utility rate projections based on currently filed General Rate Cases and historical rate increases.
- *The Challenge of Retail Gas in California's Low-Carbon Future*²⁴ is the final report for the future of natural gas project conducted by Energy and Environmental Economics and the University of California, Irvine. The information from this project contributes to the Energy Research and Development Division's Natural Gas Research and Development Program. The research team developed estimates of gas and electric rates and bills for low-carbon scenarios through 2050.

Treatment of Excess PV Generation

The 2019 Energy Code require PV systems on residential buildings. PV generation off-sets electricity demand from the grid, and therefore can off-set the electricity bill for the building occupant. During certain times of day throughout the year, there may be an excess of PV generation compared to estimated building electricity load.

CEC staff is continuing to evaluate how best to address excess PV generation under net metering agreements. The CEC will issue full guidance on this matter in proposed program guidelines.

Limitations

Ensuring no increase in energy bills is challenging, due to uncertainties in how occupants will use a building, varying weather conditions, and other factors. CEC staff have proposed using a conservative method for the Bill Savings Methodology that incorporates an additional 5% cushion in the calculation of realized cost as compared to baseline cost to ensure the resulting project complies with the bill savings requirement.

One limitation of this methodology is that it takes an average per bedroom energy utility cost for all building occupants, including common areas. The typical utility bill structure for multifamily buildings separates in-unit utility costs, paid by occupant, and energy use in common areas, paid by building owner via rents. Common areas may include computer rooms, on site offices for social/tenant services, conference rooms, social rooms, common kitchens, and central laundry rooms. Utility bills for these common areas are paid by the building owner, through collected rent, which also pays bills such as landscaping and maintenance.

23 [E3 Residential Building Electrification in California Report](https://www.ethree.com/wp-content/uploads/2019/04/E3_Residential_Building_Electrification_in_California_April_2019.pdf), https://www.ethree.com/wp-content/uploads/2019/04/E3_Residential_Building_Electrification_in_California_April_2019.pdf

24 [The Challenge of Retail Gas in California's Low-Carbon Future](https://ww2.energy.ca.gov/2019publications/CEC-500-2019-055/index.html), <https://ww2.energy.ca.gov/2019publications/CEC-500-2019-055/index.html>

This methodology assumes the baseline low-income rate, or discounted utility rate through the CARE program through the CPUC. This methodology assumes a single rate for all low-income building occupants, which may not be the case.

CHAPTER 7:

Technical Assistance and Outreach Plan

SB 1477 requires implementation of an outreach plan to encourage applications for participation in the BUILD incentive program and that projects funded with incentive funds are offered technical assistance to encourage use of the program.²⁵ Further, D. 20-03-027 requires the CEC to provide program outreach and ensure that technical assistance is available to all prospective applicants for new low-income residential building projects before implementation to encourage greater participation in the BUILD Program. D. 20-03-027 allows the CEC to solicit a third-party contractor to provide technical assistance or implement the outreach and technical assistance elements of the BUILD Program.

CEC staff proposes to hire a third-party technical assistance provider through a competitive bidding process or other contracting process. Generally, the technical assistance provider will provide design assistance to project owners and developers to overcome any technical challenges encountered in developing an all-electric residential project. As the program is intended to offer incentives to low-income residential housing projects, the technical assistance provider will be required to have experience with and expertise in working with low income housing developers, and the specific design considerations unique to low-income housing development.

Staff proposes that the technical assistance provider be allocated a maximum number of hours or budget or a combination for any project; however, CEC staff does not propose that any developer be limited in the number of projects for which they receive assistance. The specific level of funding maximum will be determined with further input from the public and program stakeholders and detailed in the proposed program guidelines.

Technical Assistance for Market-Rate Housing Developers

A core principle of the BUILD Program is contributing to market transformation. Although the initial program offering will restrict BUILD incentives to low-income housing developments, CEC staff proposes that technical assistance funds be made available for market-rate developers to improve industry knowledge of all-electric residential development. CEC staff also proposes that the technical assistance provider collaborate with CEC and CPUC staff and evaluate ways to link technical assistance TECH Initiative incentives for low-emission space and water heating equipment.

²⁵ Public Utilities Code 9321.1(d)(1)

Outreach Plan

CEC staff has a great deal of experience providing program outreach supporting incentive programs, including work specific to low-income housing developers. As such, CEC staff will implement most of the program outreach. Staff will develop a multiyear outreach plan and coordinate with the technical assistance provider to amplify outreach efforts. The outreach plan will provide a program awareness campaign to targeted audiences, collaboration with state agencies and local governments, and direct communications to known low-income housing project developers.

To encourage participation in the BUILD Program, CEC staff will investigate opportunities to partner with community-based organizations that promote access to government programs and funding for disadvantaged and low-income communities and populations. CEC staff will also coordinate with the Disadvantaged Communities Advisory Group (DACAG) to ensure programs and policies are benefitting disadvantaged communities.

To respond to interested party inquiries and support participation, CEC will also develop a call center to support BUILD Program participation and related inquiries from the public. In addition, CEC staff will provide additional outreach assistance to project developers if requested to inform the community of the details of BUILD-supported projects, availability of project units for rent or purchase, and recruiting of tenants/owners.

CHAPTER 8:

Participation Process

Participation in BUILD shall be simplified and streamlined while ensuring that all statutory requirements are met and CPUC direction followed. With a statutory focus on low-income residential development, it is critical that program participants are not unnecessarily burdened beyond what is necessary to ensure funding is used as intended. Staff aims to minimize documentation requirements and application processes to avoid duplication of information submission and otherwise decrease the likelihood of participation in the program.

CEC anticipates developing an online application and reporting tool to simplify program participation. Further CEC staff proposes that information developed for other regulatory and funding programs may be used to document necessary requirements to the greatest degree possible.

CEC staff anticipates the following general steps in the program participation process:

1. CEC staff reaches out to developers. Through CEC outreach, staff will identify project developers planning projects that may be eligible for BUILD incentives.
2. Applicant indicates interest. CEC staff determines program appropriateness for technical assistance and level of technical assistance appropriate.
3. Technical assistance provider supports design considerations. CEC staff will determine an appropriate deliverable to result from support. Maximum levels of technical assistance support and structure will be determined in collaboration with technical assistance contractor.
4. Project owner or developer submits BUILD Program application.

Initial considerations for application requirements include:

- Project Description
 - Proof of Eligibility
 - Location Details and Documentation as needed
 - Technology Design Description (elements that connect to funding)
 - Incentive Calculations
 - Project Budget and Timeline with anticipated payments
 - Potential Risks
5. CEC Completes Review of Application, Reserves Funds and Notifies Applicant of Participation Process and Steps to Receive Interim Payments - The specific milestones

and percentage of funding will be provided in progress steps to be defined in proposed program guidelines.

6. Applicant Provides Required Progress Reports and Applicant Submits Payment Invoices - All required monitoring and evaluation metrics as required by statute, D. 20-03-027, and the program evaluator will be addressed in progress reports as appropriate. Project updates and revisions will be considered and approved as necessary depending on information submitted in progress reports or as identified by project developer.
7. The final payment is made.
8. CEC provides additional outreach support for recruiting tenants and community.
9. Applicant continues to submit evaluation per requirements.

Reservation Application

With the assistance of the technical assistance provider, prospective program participants will submit a program application and supporting documentation during the design stage before construction, signaling a commitment to build all-electric housing consistent with the goals and requirements of the BUILD Program. CEC expects applications and incentive calculations to be at the subdivision or whole-building level to bundle and streamline documentation requirements. When an application is approved, the CEC will reserve funding for the project for a specified period, allowing the applicant to complete construction and submit claims for payment.

Payment Claim Application

CEC staff is attempting to design BUILD to provide for progress payments before project completion but has not yet determined a viable process that meets all state funding requirements and ensures the completion of projects supported by BUILD funds. CEC staff anticipates that program participants with approved reservations will submit progress payment claims during the construction phase and a final payment claim upon completion of the project. In similar programs, CEC has required the issuance of a certificate of occupancy or final building department approval before issuing payment; however, stakeholders have indicated that these steps may take an excessive amount of time to complete. CEC staff will continue to work with interested parties to identify appropriate documentation that indicates project completion to support payment.

Program Participation Dates and Deadlines

The Legislature provides that funding for the BUILD Program is available from a pool of \$200 million, collected over four years in increments totaling \$50 million annually starting in Fiscal Year (FY) 2019–20 and ending in FY 2022–23. Funding allocations must be disbursed within 10 years of allocation to the CEC. Any unspent funds remaining as of July 1, 2033, shall be returned to the ratepayers of the respective gas corporations.

Specific dates and deadlines for prospective applicants are not defined in this implementation plan. Proposed program guidelines will address specific application requirements.

Application Selection Criteria

For the first two years of program implementation when participants are limited to qualifying low-income housing projects, funding will be allocated on a first-come, first-served basis for applications that meet all program and eligibility requirements. CEC staff will monitor disbursements by gas corporation territory and over time to ensure that funding meets allocation percentages as required based on the source of the funds. If no projects are available to support the allocation as required, CEC staff will work with CPUC staff to determine appropriate actions during the recurring process to update the implementation plan.

Any changes to program eligibility or selection criteria will be addressed in updates to the implementation plan and if approved by the CPUC corresponding updates will be made to the proposed program guidelines.

D. 20-03-27 found that it is appropriate to prioritize BUILD Program incentives toward the regions in the state with the highest potential for achieving program goals, including reducing GHG emissions and serving low-income customers. CEC staff intend that through the program design and outreach efforts as well as program monitoring, these multiple goals can be supported over the life of the program.

CHAPTER 9:

Process and Metrics to Evaluate Program Performance

BUILD Program Metrics

BUILD is a pilot program intended to test a programmatic approach towards building decarbonization. As a pilot, information and data collected from this program will inform future policy decisions. It is important to collect information and data that will be most valuable for these decisions.

Some basic information is required by legislation. SB 1477 requires BUILD Program metrics to include, at a minimum:

- a. the number of low-emission systems installed in each building type.
- b. projected utility bill savings.
- c. cost per metric ton of avoided GHG emissions.

Moreover, statutory language requires incentives to be set to encourage building designs that reduce GHG emissions beyond industry practices and to offer greater incentives for larger projected GHG reductions. Therefore, metrics involving GHG emissions will be an essential part of data collection. The CEC may identify additional program metrics while developing proposed program guidelines, such as total avoided GHG emissions, number of new technologies funded, and number of all-electric low-income projects funded.

Data Reporting

As the BUILD Program administrator, the CEC will be expected to collect program data and deliver the data to the program evaluator in a timely fashion. The program evaluator will work with the CEC, the TECH Initiative Implementer, and the Energy Division of CPUC to determine which metrics to use to measure program success.

Program Evaluation

Per D. 20-03-027, the BUILD Program and TECH Initiative will have a single evaluator covering both programs. A single evaluator covering both programs will simplify engagement during program design to ensure the pilot programs are set up with evaluation needs in mind. Per D. 20-03-027, the CEC and CPUC will coordinate to solicit, hire and manage a program evaluator using \$5 million in allocated funding for the evaluation budget. Using the metrics identified in SB 1477 as well as final BUILD guidelines, the program evaluator will measure the effect of program activities, as well as qualitatively assess the success and scalability of the strategies of the programs and analyze bill savings under BUILD. The program evaluator shall be continuously engaged throughout the initiation and administration of the SB 1477 pilot programs.

The program evaluator shall work with CPUC Energy Division staff, the BUILD Program administrator, and the TECH Initiative implementer to determine which of the following additional metrics should be required, as part of pilot program evaluation: (1) market share data (*i.e.*, demographic factors) that track both the overall share of various low-emissions technologies and the share of new installations; (2) customer outreach and customer satisfaction; (3) number of workers trained to install each type of technology and size of available skilled workforce; (4) contractor performance; (5) full life cycle of replaced and replacement appliances; (6) success in degree of training provided to market actors necessary to facilitate market transformation; and (7) types of refrigerants used, and their associated Global Warming Potential (GWP), in space and water heating equipment promoted through the BUILD Program and TECH Initiative.

The program evaluator shall ensure that the BUILD Program administrator and TECH Initiative implementer include the following data annually so that gas corporations can comply with their reporting obligations under the Cap-and-Trade program: (1) total avoided GHG emissions expected from that year's expenditures (estimated); (2) total expenditures; (3) itemization of administration and outreach expenditures; and (4) description of the nature and purpose of the program, including aspects such as eligibility requirements.

Chapter 10: Next Steps

CEC staff will accept public comments on the BUILD Implementation Plan and continue to collaborate with CPUC staff and program stakeholders to further develop the BUILD Program. CEC staff also anticipate additional public engagement through workshops and meetings as the agency seeks to develop proposed program guidelines that will be submitted to the CPUC for approval prior to accepting applications for funding. Proposed program guidelines and program materials will address all requirements of SB 1477 and D.20-03-027, provide complete instructions for program participation, and discuss the terms and conditions for receipt and use of funds.

To participate and receive updated information on the BUILD Program, all interested parties are encouraged to register for the appropriate listserv through the CEC webpages.

APPENDIX A:

Eligible Equipment Lists

Eligible Equipment Lists

As administrator of the BUILD Program, the CEC aims to develop proposed program guidelines that not only achieve program GHG emissions reductions and bill savings goals but simplify participation. CEC acknowledges that there are existing processes for evaluating the safety and performance of the range of technologies employed in meeting BUILD’s GHG emissions reduction goals. Rather than create a new evaluation process, the CEC intends to use existing evaluation processes and sources of information. This will simplify participation and support the efforts of organizations that have similar goals to promote the design, manufacturing, and installation of high quality, energy efficient products. Table A.1 provides the eligible equipment list sources for each technology type.

Table A.1: Eligible Equipment Lists

Technology	Eligible Equipment Lists
Heat Pump HVAC	NEEP’s cold climate Air-Source Heat Pump Products List
Heat Pump Water Heater	NEEA’s Advanced Water Heater Specification Qualified Products List for Heat Pump Water Heaters
Central Heat Pump Water Heater	CEC’s Central HPWH Performance Map Certification List
Heat Pump Clothes Dryer	Energy Star’s Product Finder
Battery Storage System (Battery or Energy Storage System)	CEC’s Solar Equipment Lists

Cold Climate Air Source Heat Pump List

The Northeast Energy Efficiency Partnership (NEEP) is a non-profit organization that supports state efficiency policies and programs by fostering collaboration and innovation, developing tools, and disseminating knowledge. Its mission is to accelerate regional collaboration to promote advanced energy efficiency and related solutions in homes, buildings, and communities.

NEEP leads the High-Performance Air Source Heat Pump Initiative, whose participants include energy efficiency program administrators, heat pump installers, state energy office staff, and

technology experts. The Initiative developed the specification to better characterize heat pump performance with the Cold Climate Air Source Heat Pump (ccASHP) Specification.²⁶ The specification was designed to identify air source heat pumps that are best suited to heat efficiently in cold climates. It is intended as a model equipment specification to be used broadly by clean energy and energy efficiency program qualification. It is also intended for engineers and contractors who need assurance that the equipment they select will have the require heating capacity and design temperature without unnecessary oversizing, and will serve the load efficiently throughout the ambient temperature range.

The ccASHP specifications require that units be part of an Air Conditioner, Heating, and Refrigeration Institute (AHRI) matched system, defined by federal regulation 10CFR §430.2 as a central air conditioning heat pump. Performance requirements also includes a minimum HSPF, minimum coefficient of performance (COP), and minimum seasonal energy efficiency ratio (SEER). The ccASHP specifications are updated on an as needed basis and is on version 3.0. NEEP keeps a list of products²⁷ that meet the ccASHP specifications and lab testing results or engineering data for each system must be reported. This product list is used by programs in the Northeast, Midwest, Northwest, and Canada. Because these products work well in cold climates, they should also work well in all of California's climates, which usually experience milder temperatures.

Advanced Water Heating Specification Qualified Products List for Heat Pump Water Heaters

The Northwest Energy Efficiency Alliance (NEEA) is an alliance of more than 140 Northwest utilities and energy efficiency organizations working to cost-effectively deliver energy efficiency through market transformation. One of NEEA's area of work is advancing the market for heat pump water heaters. Utilities, energy efficiency organizations, and market partners developed the Advanced Water Heating Specification²⁸ to advance higher performing water heaters. While the specification aims to ensuring performance in cooler northern climates, the applicability and benefits extends beyond the Northwest.

Since the BUILD Program is a residential building decarbonization program, the specification to evaluate technologies eligible under the BUILD Program will be the Electric Advanced Water Heating Specification²⁹ for residential water heaters. This specification provides guidance to manufacturers and market actors who are interested in developing products that not only meet Energy Star criteria but are able to provide high levels of consumer satisfaction and energy performance in a range of climates. The specification includes requirements for energy efficiency, noise, condensate management, minimum warranty, and testing guidelines.

28 [NEEA's Advanced Water Heating Specification](https://neea.org/our-work/advanced-water-heating-specification), <https://neea.org/our-work/advanced-water-heating-specification>

29 [NEEA's Advanced Water Heating Specification](https://neea.org/img/documents/Advanced-Water-Heating-Specification.pdf), <https://neea.org/img/documents/Advanced-Water-Heating-Specification.pdf>

Manufacturers who wish to include their products on the qualified products list³⁰ must submit an assessment that shows the product meeting all the requirements. A third-party lab also independently tests the products to verify performance results. NEEA updates the product list about every six to eight months.

Products meeting the specification are in the 45 to 60-gallon range. Most commonly, systems of this size are used in single family residential buildings or small multifamily buildings, such as duplexes. There is an effort to set design criteria, performance specifications, and installation guidelines for heat pump water heaters with larger capacity.

The goal of the Advanced Water Heating Initiative (AWHI) is to advance the development and adoption of heat pump water heating technologies, including central heat pump water heating systems. The AWHI aims to encourage low-GWP refrigerants, plug-and-play packed systems, ability for load shifting, reliability, and cost-effectiveness. This effort will lead to better guidelines for central heat pump water systems used in larger multifamily buildings.

A Central Heat Pump Water Specification is under development with NEEA, and the CEC will consider adopting these specifications when they are available.

Central HPWH Performance Map Certification List

Central heat pump water heaters that are approved in CBECC will be eligible for the BUILD Program. The Central Heat Pump Water Heater (HPWH) Performance Map Certification List³¹ can be referenced for approved equipment. To be listed, manufacturers will be required to submit performance data from a third-party test lab, bench tests by third party consultants, test carried out in the factory, or data collected from working field demonstrations.

Energy Star

Energy Star is the trusted, government-backed labeling program for energy efficiency. The U.S. Environmental Protection Agency (EPA) established the Energy Star label to reduce GHG emissions and other pollutants caused by the inefficient use of energy and make it easy for consumers to identify and purchase energy efficient products that offer savings on energy bills without sacrificing performance, features, and comfort.

The EPA established Energy Star specification³² based on the following set of key guiding principles:

- Product categories must contribute significant energy savings nationwide.
- Certified products must deliver the features and performance demanded by consumers, in addition to increased energy efficiency.

30 [NEEA's Qualified Products List](https://neea.org/img/documents/qualified-products-list.pdf), <https://neea.org/img/documents/qualified-products-list.pdf>

31 [CEC's Central HPWH Performance Map Certification List](https://www.energy.ca.gov/media/4026), <https://www.energy.ca.gov/media/4026>

32 [How Product Earns Energy Star Label](https://www.energystar.gov/products/how-product-earns-energy-star-label), <https://www.energystar.gov/products/how-product-earns-energy-star-label>

- If the certified product costs more than a conventional, less-efficient counterpart, purchasers will recover their investment in increased energy efficiency through utility bill savings, within a reasonable period.
- Energy efficiency can be achieved through broadly available, non-proprietary technologies offered by more than one manufacturer.
- Product energy consumption and performance can be measured and verified with testing.
- Labeling would effectively differentiate products and be visible for purchasers.

The EPA will consider Energy Star specification revision based on these factors:

- A change in the Federal minimum efficiency standards.
- Technological changes with advances in energy efficiency which allow a revised ENERGY STAR specification to capture additional savings.
- Product availability.
- Significant issues with consumers realizing expected energy savings.
- Performance or quality issues.
- Issues with test procedures.

There are established Energy Star specifications clothes dryers. For the BUILD Program, the Energy Star rating will be used as the process for evaluating new clothes drying technologies. Home appliance products that earn the Energy Star label are independently certified to save energy and save money to the consumer.

CEC Solar Equipment Lists

The CEC maintains lists of solar and storage equipment that includes photovoltaic (PV) modules, inverters, batteries, energy storage systems, meters, performance monitoring and reporting systems, and other solar energy-generating systems. The CEC's Solar Equipment Lists³³ were developed under Senate Bill 1, establishing criteria and standards for solar projects applying for ratepayer-funded incentive programs under the California Solar Initiative. The purpose and use of these lists have expanded over time and provide information that supports solar incentive programs, utility grid connection services, consumers, and many other state and local programs.

Manufacturers who wish to include their equipment on the Solar Equipment Lists must submit all required documentation showing their equipment meets all safety and performance

³³ [Solar Equipment Lists](http://www.energy.ca.gov/programs-and-topics/topics/renewable-energy/solar-equipment-lists), www.energy.ca.gov/programs-and-topics/topics/renewable-energy/solar-equipment-lists

standards outlined in the Guidelines for California’s Solar Electric Incentive Programs (Senate Bill 1)³⁴.

For energy storage systems, the safety certification must be from an NRTL and performance characteristics are provided from manufacturers. The Energy Storage System List reflects equipment certified to UL 9540, advanced inverter functions, and the approval status of the equipment for JA 12 requirements.
